HIGHLAND AND AGRICULTURAL, OF SCOTLAND, *Jan.* 14.—The half-yearly general meeting of the Highland and Agricultural Society of Scotland was held in the Society's Hall, Albyn-place; his Grace the Duke of ROXBURGH, the President of the Society, presided. *The Glasgow Show and Meeting in* 1852.—The SECRETARY read the following report regarding the Society's Show at Glasgow last year:—The Directors have much pleasure in reporting to the general meeting the highly satisfactory result of the Glasgow Show, which, whether in point of extent or character, may be regarded as the most successful meeting ever held under the auspices of the Society. The exhibition, on the largest scale previously, was that which took place at Glasgow in 1844, when the number of entries was 1489. On the last occasion they amounted to 1845. The quality of the stock afforded gratifying evidence that the valuable pure breeds of the country, both in cattle and sheep, are progressively improving, the exhibition of implements far exceeding anything of the kind previously witnessed in Scotland, and was such as to justify the increased encouragement which the Society has of late given to this important department. The Directors conceive this to be a fitting opportunity for considering the time and place of the next show. The Society is aware that there now exists a rule providing that shows shall be held triennially. This arrangement was rendered necessary at the time by the difficulty and expense of maintaining annual meetings; but, in deference to a desire generally expressed in 1848, it was resolved to anticipate the triennial period, by holding the Glasgow Show in 1850; and, in like manner, the Directors are prepared, if sanctioned by the Society, to respond to the desire so strongly expressed by all parties at Glasgow, by making arrangements for a show in 1852. With this view they propose to publish, in the forthcoming premium book, a list of the classes of stock, &c., for which prizes will be offered, with an intimation that the place of the show and the amount of the different premiums will be announced at the general meeting in June. The Directors have no hesitation in expressing their opinion that Perth is the proper place for the meeting. The Society has not visited that locality since 1836; it is accessible by railway from all parts of the country; and though its immediate neighbourhood may not depend principally on stock, it is the centre of a great breeding and agricultural district. Last year the Directors were memorialised by a number of influential proprietors, in Perthshire to fix a meeting or the present year, but it was considered expedient to defer it, on account of the Great Exhibition in London; many of the memorialists have again expressed their willingness to support a meeting in 1852, and a numerously-signed requisition to that effect has just been received from the western district of the county. If approved of by the Society, the Directors would willingly endeavour, before the next general meeting, to make the necessary arrangements with the counties of Perth, Fife, Clackmannan, and Kinross, which would constitute a compact and convenient district.—The Duke of BUCCLEUCH said it now devolved upon him to allude to the latter part of the report which had been read, and to submit a motion in regard to the proposed show in 1852. It had, at one time, been suggested that a meeting should be held this year at Perth, but after full consideration, it was considered more advisable to postpone the show till 1852, on account of the Great Industrial Exhibition which takes place this year in London. This great exhibition, it was naturally thought, would attract parties to London from all quarters of the country, and consequently materially injure the more humble, but not less useful exhibition of the Society. It was proposed, therefore, to hold the next meeting at Perth, in 1852. It was now many years since an exhibition had taken place in that city; and he had no doubt, when it did take place, that it would be a most successful one, and he did not know a county in Scotland better fitted for such a meeting than Perth. It was now, from the net-work of railways, in all directions, accessible alike to their agricultural friends in the south and north; and being itself, and the districts around it rich in agricultural productions, as well as distinguished for its rearing of stock, he was confident that the show would be an excellent one. (Applause.) The motion which he had to submit was as follows:—"That the Society shall hold a show in 1852; that, in the opinion of the meeting, Perth is the fittest place for the purpose; and that a remit be made to the directors to prepare a list of premiums, and to endeavour to make the necessary arrangements with the county and city of Perth, and with the counties of Fife, Kinross, and Clackmannan." This motion was unanimously adopted. *Monthly Meetings.*—Professor Low said, I am gratified to be able to report, with respect to these monthly meetings instituted by the Society, that they continue to meet with favour, and to receive increasing support. The subjects lately discussed at the monthly meetings, have been—1st, The advantages or disadvantages of subsoil ploughing, and of trench ploughing. 2d, The best and most economical mode of feeding farm-horses. 3d, The best varieties of Oats to sow. 4th, The best varieties of Wheat to sow, quantities of each, and comparative advantages of drilling, dibbling, or sowing broadcast. 5th, The substances which can be most profitably employed as auxiliary to Turnips in fattening cattle and sheep. 6th, The best mode of preparing and applying the different manures produced on the farm. I believe I shall but anticipate the wishes of the meeting, when I propose a vote of thanks to the intelligent gentlemen who have taken part in these discussions, or who have otherwise co-operated with the Society in supporting these meetings.—Mr. MACONOCHIE said he was convinced that more information was derived from the late meetings than from any that had taken place during the last two years; and he could only express a strong wish that such persons in England as had a few weeks ago been depreciating Scotch farming, had had an opportunity of listening to

the addresses that had been delivered at these meetings. He was certain that it was impossible for any man to have heard these addresses and not to have been convinced that the farmers of Scotland were a well-educated class, and anxious to promote every improvement that was of advantage to themselves and the community at large. *The Chemical Department.*—Dr. Anderson said, he had now to report the progress of the chemical department for the past year. During that period a considerable amount of work had been done. They had analysed 200 different specimens, embracing manures, soils, &c., submitted by members of the Society and others. That, however, embraced but a small part of the actual work that had been performed, because the members of the Society were aware that there had been submitted to him various other subjects of agricultural interest, in which great progress had been made. One of the most laborious and complicated of these had been published in the July Number of the *Transactions*—namely, on the Wheat soils of the different districts of Scotland. Another difficult subject of investigation which he expected to have been able to have published before this time, had been postponed by the continuous supply of new material that had been sent in to him. This investigation had reference to Turnips grown in different ways. It had been postponed, as he had said, frequently, and even to-day he had received another lot of Turnips; but he was now glad to say that the investigation was so far advanced that it would not be long now until it was published. He had also recently submitted to him by the committee an investigation regarding the economic uses of peat—a subject which had been exciting considerable interest of late. Part of that investigation was ready, and it would be published in the next number of the *Transactions*. Last year he had got into the new laboratory; and, as he expected, it had tended greatly to facilitate operations. With regard to the general business of the chemical department, his desire had been to make it in all respects accessible and advantageous to the Society. In doing this, he had spared neither trouble nor expense. He was sure that, during the last two years, he had expended on the business of the laboratory more than he had received from the Society. (Hear, hear.) He could assure them that he had entered on his duties two years ago with considerable anxiety, being afraid that the agricultural mind was not favourably disposed to support the efforts of the chemist; but his experience, during the two years that he had held the situation, had shown him that his anxieties were unfounded, and he was now gratified to state that great interest was taken in his labours. He had to thank the members of the Society for supplying him with materials for investigation. (Applause.) After a vote of thanks to the Duke of Roxburgh for his conduct in the chair, the meeting separated.

METEOROLOGICAL REPORT.—March.

* This storm came from the south, from the warmth of the rain which preceded it, and curved across the south of Scotland eastwards, and before it had quitted this island

Storm † arrived from the westward, and to the collision of these two currents * and †, and the consequent electricity, I attribute the hailstorm which came with the change of the wind.

(Any information on the time and duration of the passage of this hailstorm will much oblige the author, from any place in England or Scotland.)

‡ From the coldness of the rain, this storm came from the direction of Newfoundland, and probably from the St. Lawrence and the great lakes of North America. It must have crossed Scotland, or even further to the northward (as it was of large diameter) and went towards Norway.

Dorchester, April 3d. *F. P. B. M.*

(*To be continued.*)

## Miscellaneous.

*New Subsoil Plough.*—A few months ago, Lord James Hay brought out a new subsoil plough, which consists of a beam and a pair of handles of malleable iron. The shank or coulter is so placed as to have the whole of the beam in front, and the handles rising directly behind it. The beam is short, and is supported on an axle connecting two rather high wheels. The shank passes, like a common coulter, through a box in the beam, and is fixed with wedges. Its form is that of a coulter, having the point projecting forward, and inclining downwards at an angle to the horizon; and each side of its projecting point is furnished with a slight feather, to stir the loosened subsoil. That the shank may take a deeper or shallower hold of the subsoil, it is moved higher up or lower down in its seat; and that the depth of furrow may be regulated to the power applied to the implement, the beam can rest either above or below the axle. An ordinary bridle is attached to a slot at the end of the beam. Although exceedingly light—being made of the finest and best iron—it is quite astonishing what rude blows it will stand when coming in contact with the numerous fast stones which are found planted, cause-wayed as it were, in the subsoil of the North of Scotland. Mr. J. I. Boswell, of Kingussie, Kincardineshire, states that he has seen it at work more than once on his lordship's own farm, and that he is convinced it will answer all the purposes required. He says, moreover, that the invention of this light-wheel subsoil by Lord James Hay has achieved a great improvement on the old one. It does away with the necessity of injuriously putting several pairs of horses together on large farms, and it brings the operation within the reach of those who have only four working cattle on small ones. It is, comparatively speaking, a small expense, costing only about 4*l.* 4*s.*, while the old plough was about 15*l.*; and last, although not least, it is much more easy for the ploughman to hold—the wheels equalising the draught to the horses, and keeping the implement steady to the work; while it can be properly regulated to the draught of either horses or oxen by shifting the beam, and working it either above or below the axle of the wheel, as the ploughman finds best. *From the Architect, Feb.* 1.

## Calendar of Operations.

MARCH.

Lammermuir Sheep Farm, *March* 31.—During the last fortnight, the character of the weather has changed for the worse. During that time, we have had more or less rain every day, with two falls of snow to the depth of a couple of inches, which, however, very quickly disappeared. When sheep are subjected to frequent wettings, it is always more or less injurious. They become listless, and unwilling to move about in search of food, what they do get being very unpalatable. The wool also is liable to part along the back, admitting the cold and wet, this being, in our opinion, the fertile source of various diseases to which sheep are subject, such as water in the head, staggers, &c., whose seat are in the brain or spine. We have more than once adverted to the beneficial effects of jacketing young sheep, as observable in the better condition, in increasing the growth and quality of the wool, and especially in the greater exemption from disease. During the last seven months, we find that, out of 570 Cheviot and black-faced ewe hoggs, with no other food but what they pick up on their hill pasture (30 of the worst of the former have been on Turnips for four months), the number of deaths from all causes have only amounted to eight. Even granting that the past has been an unusually favourable winter, this loss is very trifling, and we are inclined to place it, in a great measure, to the credit of their flannel coats. We may also observe, that they are in decidedly better *condition* than those of some of our neighbours which have been getting Turnips. It covers are so beneficial to young sheep, they should be equally so to old, especially *ewes;* and the only reason why they are not more generally used, appears to be the expense, it being a somewhat serious matter when several thousands have to be operated upon. Take for example, a flock of 2000, at 3*d.* per head, the sum will be 25*l.*; but as upon an average the jackets last three years, the annual amount is really not very serious. So convinced are we of the benefits of these covers, that if spared to another autumn, we purpose making the experiment of covering a part of the ewes of each hirsel, and comparing them with the others in spring, as regards condition, growth of wool, and general health. Were the jackets dipped in, or covered with, some substance which would render them waterproof, without greatly adding to the expense, it would be an improvement. Could some of your correspondents suggest anything suitable for this purpose, we would feel greatly obliged. The gimmers—or shearling ewes—were put upon Turnips on the 1st of March, the two older ages, on the 22d. The ground, although drained, was so thoroughly soaked with rain from the 22d to the 28th, as to render it necessary to give them their Turnips upon Grass. Though looking well previously, this long-continued and heavy rain has given them a very draggled appearance. On the 26th, the streams were more flooded than they have been for four years. We need not say that the same causes have greatly retarded the sowing of Oats. Some 10 or 11 acres were sown on the 16th, and we have only resumed operations this morning, and, should it continue dry, we expect to finish all that is ready during this week. Hitherto the rain has also prevented any heather burning, and as "the law enacts" that none shall be burnt after the 10th of April, we fear that—on mossy grounds at least, which are long in drying—little or nothing will be done this spring. This is a more serious loss than many would suppose, but must be submitted to with patience; the destruction of a few grouse eggs being a far more serious matter! The best heather grows upon peat, and upon an average should be burned every six or seven years. That growing upon dry soil is tufty, grows slowly, does not burn readily, and is little relished by sheep. *A Lammermuir Farmer.*

## Notices to Correspondents.

Allotments: *Northwards* asks for a rotation of crops for a cottage plot of land. Any one who has had experience in small farming would do a service by giving our readers some of it.

Blackie's Cyclopedia: *G W P.* It will be completed, probably, some time about Midsummer next year. The last Number (12) was issued just the other day.

Boarded Floors: *B A, Cantab.* A boarded floor is not well suited for such a heavy animal as a horse; when wood, however, is employed, it should be prepared in blocks, similar to the wood pavements sometime since extensively laid down in the metropolis, but now almost abandoned, in consequence of not wearing well and being very slippery. If economy and cleanliness are both required, there is nothing cheaper, or more calculated to prevent unpleasant smell, than a thick layer of simple earth or mould, as dry as possible, which will absorb the urine, fix the ammonia, and render it available for manure. *W. C. S.*

Box-feeding: *An Old Sub.* It is preferable to stall-feeding, where you have room enough and straw enough—9 feet square per head, and 20 lbs. of litter, daily, per head. Swedes may be worth 7*l.* per acre to the grower feeding them on his farm, if he knows how to buy stock, and sells them fairly when "ripe." We should prefer dividing our sheep into lots of 40 or 50, rather than having them 200 in one pen. Sheep are never littered when folded on land. Sheep would do better on Tares with corn, than on good Grass land without corn. They *will* get dirty this weather; and it is against them. It has been a bad season for folded sheep.

Early Spring Food: *J M'C.* Rye sown in September is the earliest spring food; and probably it is the best thing you could sow upon your Oat stubble.

Farm-yard Manure: *An old Subscriber.* The dung heap will, under the careless system, more rapidly diminish in bulk than in value, so that a load of it unrotted is not worth much more than half a load of the well rotted manure: while the whole bulk of the heap after rotting in this way may be worth perhaps two-thirds or three-fourths of the whole bulk in its original state. When carefully prepared the whole heap is worth as much as in its original state, indeed more, the labour spent upon it not being lost; and as the bulk of the heap does diminish somewhat, the value of a given bulk increases in the same proportion.

Flax: *T W.* Deman's pamphlet. See last number.

Modern Cow-keeper: *Anna.* We were unfortunately wrong in the statement of i s price. It is a little book, but we spoke from, as it appears, a mistaken memory.

Italian Rye-grass: *M.* We do not know of any pamphlet, particularly on the Italian Rye-grass.

Oats: *P B F.* We have somewhere seen a statement of the relative value as food of the whole plant before the seed had formed, and after it had ripened, but cannot recollect where. Perhaps some one can help you to information on the value of Oat hay.

Osiers: *H* From your description of the land we should fancy it as fit for Osiers as anything. One of the coarser sorts had better be selected: such as the Brindled Osier, *Salix viminalis.* Plant the sets 3 feet by 2 inches apart immediately.

Portable Railway: *Erratum.* In your account of my Portable Railway last week, I observe an error, which I beg to correct. You state the price of the turn-tables at 10*l.*, which is a misprint, as they are only 10*s.* each. *Robert Neilson, Halewood, March* 29.

Poultry: *Nimis.* No one would think of eating hen-turkeys after they have begun to lay. If in good condition, they might neither be unpalatable nor unwholesome; but it seems both cruel and wasteful to kill them then. The Turkeys reserved for Lent consumption are those which had been hatched very late the previous summer.—*T B.* The particulars given only enable us to advise you to change your cocks, perhaps the whole stock. The ducks ought to have a swimming-place, however small. Bruised Oats and Oatmeal and water is not food good enough for new-hatched chickens; they should have hard-boiled egg and crumbs of Wheat bread.

Sheep: *W E.* Blacklock on sheep, the cheapest; Spooner on the sheep, one of the best.—*Constant Subscriber.* You had better tie some thorns round the stems of the young fruit trees, lest the sheep injure them.

Tank-water: *X Y.* Undiluted by water it must be valuable, and would pay for considerable cost of carriage. If, owing to wet weather, you cannot carry it on the land direct, a heap of burned clay, vegetable mould, &c. would be a good absorbant of its valuable part, and the rest might go to waste.

The Ace of Spades: *M C Salvin.* Thanks. His case has already been given in our columns, though, at the moment, we cannot refer to dates; perhaps we may refer to it again. We should be very glad to have the pamphlet.

Wood-ashes: *R H C* 20 or 30 bushels per acre is a common dressing. Sow broadcast; and don't mix it with the guano. We should subsoil plough, or otherwise stir the subsoil, even though it were a loamy stratum, for Carrots.

Woodland, Broken up: *Herefordshire.* Plough and lime it this summer, and next year you can grow some green crop on it, as Potatoes—the cultivation of which will still further mellow it.

## Markets.

COVENT GARDEN, April 5.

New Hothouse Grapes, both white and black, may be obtained. Good Pine-apples are scarce, as are also dessert Apples. Oranges and Lemons are plentiful. Nuts remain nearly the same as last week. Forced Strawberries are more plentiful. Vegetables of all kinds are abundant and good. French Beans and Cucumbers are plentiful. Carrots and Turnips are good in quality. Potatoes have not altered since our last report. Lettuces and other salading are sufficient for the demand. The best Mushrooms fetch 1s. 3d. per pottle. Cut flowers consist of Heaths, Pelargoniums, Camellias, Mignonette, Double Primroses, Stephanotis floribunda, Cinerarias, Moss and Provins Roses, and the different kinds of spring bulbs.

FRUIT.

### COAL MARKET.—Friday, April 4.

Holywell, 14s.; Carr's Hartley, 14s.; Eden Main, 14s. 9d.; Wallsend Riddell, 13s. 6d.; Wallsend Gosforth, 14s; Wallsend Haswell, 15s. 9d.; Wallsend Hetton, 15s. 9d.; Wallsend Lambton, 15s. 6d.; Wallsend Stewarts, 15s. 9d.—Ships at market, 147.

### POTATOES.—Southwark, March 31.

The Committee report that the arrivals during the last week from Yorkshire have been considerable; those from Scotland and the Continent have been limited. Trade heavy, and it was with difficulty the following quotations were realised:—York Regents, per ton, 70s. to 90s.; Scotch do., 50s. to 75s.; ditto Cups, 60s. to 70s.; Cambridgeshire and Lincolnshire Regents, 50s. to 70s.; French whites, 50s. to 60s.

### SMITHFIELD, Monday, March 31.

We have a large supply of Beasts, and of good quality; trade is heavy, and although we retain 3s. 8d. in our quotations, it is only realised for choice descriptions. The number of Sheep is larger; choice Downs are selling quite as dear as of late, but trade is dull for other kinds at a slight reduction. Good Calves are not plentiful, and maintain late rates. From Holland and Germany there are 373 Beasts 1030 Sheep, and 89 Calves; from France, 40 Pigs; from Norfolk and Suffolk, 2700 Beasts; from Scotland, 320; and 100 from the northern and midland counties.

| Per st. of 8 lbs.— | s | d | s | d | Per st. of 8 lbs.— | s | d | s | d |

Beasts, 4017; Sheep and Lambs, 20,060; Calves, 130; Pigs, 340.

Friday, March 28.

We are moderately well supplied with Beasts; trade is dull, notwithstanding we are enabled to return Monday's quotations. Sheep and Lambs are more numerous, especially the latter, for which there is rather a large demand; choice descriptions make about 5s. 8d. Prices for Sheep are about the same as on Monday. There is more cheerful trade for Calves, but it is exceedingly difficult to obtain more money. From Germany and Holland we have 25 Beasts, 480 Sheep, and 136 Calves; from Scotland, 100 Beasts; from Norfolk and Suffolk, 200; and 38 milch cows from the home counties.

### MARK LANE.

Monday, March 31.—The supply of Wheat from the home counties this morning was again short; a few picked samples of white Essex realised rather more money; for secondary and out-of-conditioned parcels no improvement could be obtained. Foreign is quire in retail sale, and we do not alter our quotations.—Barley, both malting and grinding qualities, are 6d. per qr. dearer.—Beans and Peas are a fair sale at late rates.—Oats are in demand at an advance of 6d. to 1s. per qr.—In Flour there is no alteration.

Friday, April 4.—The supplies of grain, both English and foreign, are moderate since Monday. This morning's market was thinly attended; there was but very little English Wheat on sale, which realised that day's prices, as did also foreign in the few retail sales effected. The value of spring corn remains unaltered.—Flour moves off slowly.—In floating cargoes of Black Sea and Mediterranean Wheat but little doing. Sales of Indian Corn have been made at 27s. per qr., c. f. and insurance for Tuscan and Salonica, at 29s. to 31s. for Ibraila and Galatz.

Liverpool, Tuesday, April 1.—The arrivals since Tuesday from Ireland and coastwise are liberal of Oats, but light of other articles. The trade has been quiet during the week, but in the sales made of Wheat and Flour former prices have been supported. Oats and Oatmeal, with a good demand, advanced 1d. per 45 lbs. At this morning's market there was the usual attendance of town and country dealers, and a fair demand was experienced for Wheat and Flour at the prices of Tuesday last. Oats and Oatmeal were in good request, at an advance of 1d. per 45 lbs., and 6d. per 240 lbs. Beans must be quoted 6d. per qr. dearer. Barley and Peas without change. Indian Corn met with a good demand, at 30s. 6d. for new, and 31s. per 480 lbs. for old yellow American.—Friday, March 28.—Though the wind has been favourable for arrivals the last three days, the supplies of grain and Flour have been trifling, either from our own coast or from abroad. Consumption is going on steadily, and prices are firmly maintained. The business at our market this morning was very moderate. Wheat and Flour fully supported the rates of Tuesday. The principal demand was on Indian Corn, at 6d. per qr. advance, the best American yellow having touched 31s. per 480 lbs. Egyptian Beans were a trifle higher, but there was no change of price in Oats, Barley, or Peas.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

WARRANTED BEST MATERIALS AND WORKMANSHIP, AT THE LOWEST POSSIBLE PRICES.

J. WEEKS and CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. Weeks and Co., King's-road, Chelsea, London.

DEANE'S WARRANTED GARDEN TOOLS.—Horticulturists, and all interested in Gardening pursuits, are invited to examine G. and J. Deane's extensive Stock of GARDENING AND PRUNING IMPLEMENTS, best London made Garden Engines and Syringes, Coalbrookdale Garden Seats and Chairs.

G. and J. Deane are sole Agents for LINGHAM'S PERMANENT LABELS, samples of which, with the Illustrated List of Horticultural Tools, can be sent, post paid, to any part of the United Kingdom.—Deane's Horticultural Tool Warehouse, opening to the Monument, 46, King William-street, London-bridge.

COCHIN CHINA FOWLS' EGGS FOR HATCHING:—MALAY, POLISH, SEBRIGHT'S LACE-FEATHERED GOLD and SILVER BANTAMS, and WHITE JAVA SILKY BANTAMS (as in her Majesty's Aviary at Windsor), 1s.; and MINORCA (everlasting layers) and pure bred white-faced SPANISH at 6d. each, throughout the season. Sent into the country, safely packed, on receipt of Post-office order (not stamps), with 1s. for box, &c.; a short notice occasionally required. Apply to Timothy Mason, No 5, Bear's Place, New North Road, London. A Cochin China Cock and two Hens, price 2l.; Cocks, 12s. each: Malay and Spanish Fowls, Carrier and Almond Tumbler Pigeons, Gold Pheasant Cocks, &c. All letters enclosing stamp will receive reply. Gold and Silver Pheasants' Eggs shortly.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

STEPHENSON and Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

THE METALLIC PAINT, produced by the Patent Alkali Company, has been extensively used for several years on farm-buildings, iron bridges, roofs and railings, shipping, &c., and it is admitted that it covers a greater surface and stands far better than any other pigment on wood, iron, Aberthaw Lime, and Roman Cement. Fine Black, 25l. per ton, and Rich Purple-brown, 20l. per ton.—Offices of the Company, 1, New Broad-street, London.—John A. West, Secretary.

Price 1l. 11s. 6d., imperial 8vo

THE ROSE GARDEN. By William Paul. The work is embellished with 15 highly-finished Coloured Drawings by Andrews, Maubert, and Wakeling; and numerous Wood Engravings.

"Any amateur who will procure Paul's 'ROSE GARDEN' will make his course clear for the successful cultivation of this beautiful Flower, and soon have all that it costs him in the certainty of his operations."—*Gardeners' Chronicle.*

"The important subject of pruning is handled in a masterly manner. A book full of most useful information."—*Beck's Florist.*

"Given in so plain and understandable a manner that the merest tyro, by following the directions, may count on success."—*Florist's Journal.*

London: W. and T. Piper, 23, Paternoster-row; and all Booksellers.

OFFICIAL EXHIBITION CATALOGUES.—ADVERTISEMENTS will continue to be received for insertion in the Official Catalogues during the whole time the Exhibition remains open; but as the Contractors are bound to pay a penalty of 50l a day if they do not deliver the first edition to the Royal Commission by the 28th of April, those Advertisements intended for the first five series of 20,000 each of the small Catalogue, and for the first editions of the Illustrated and French and German Catalogues, must be sent to the Contractors by the 15th of April.

Spicer Brothers, Wholesale Stationers, W. Clowes and Sons, Printers, } Joint Contractors to the Royal Commission.

Official Catalogue Office, 29, New Bridge-Street, Blackfriars.

SPLENDID WORK ON NATURAL HISTORY.

EDWARDS'S BOTANICAL REGISTER, consisting of Coloured Figures of Plants and Shrubs cultivated in British Gardens, with their History, Treatment, &c. New Series Edited by Dr. Lindley, with 750 *beautiful coloured plates*, 10 large vols. royal 8vo, new cloth, 5l. 15s. (pub. at 22l.) 1838-47.

This is the new and complete series of this beautiful and esteemed work. As the number for sale is very limited, early application is desirable.

MEYER'S BRITISH BIRDS and their EGGS, *322 beautiful coloured plates*, with Descriptions. 7 vols. 8vo, in 108 Parts just published at 18l. 18s.), only 8l. 8s. 1841-50.

This beautiful publication is the most complete illustrated History of British Birds. The figures are all drawn from nature.

CUVIER'S ANIMAL KINGDOM, arranged according to its Organization, being a description of Quadrupeds, Birds, Fishes, Insects, Shells, &c. By Cuvier and Latreille. Translated from the last French edition, with 4000 figures, mostly coloured, on 800 plates, 8 vols. 8vo, half morocco, 3l. 10s. (pub. at 8l. 8s.) 1837.

This is the most scientific and general work upon the subject, and the only one upon Natural History suitable for a "Home Library."

WOOD'S BRITISH ENTOMOLOGY, or Illustrated Catalogue of the Lepidopterous Insects of Great Britain, containing 1044 *figures, beautifully engraved and coloured, of all the Butterflies and Moths*, with an Account of their Localities, &c. 8vo, cloth, 3l. 10s (pub. at 8l. 3s.) 1845.

The most complete illustrated work on British Butterflies and Moths. The figures are executed with remarkable beauty and fidelity. Very few copies remain for sale.

G. WILLIS, GREAT PIAZZA, COVENT GARDEN.

THE GARDENERS' CHRONICLE.—To be Sold, the GARDENERS' CHRONICLE for the years 1841 and 1842, half bound; 1843, 1844, 1845, 1846, and 1847, in Numbers, complete, and in good condition, price 5l. 10s. Also, THE LADIES' FLOWER-GARDEN OF ORNAMENTAL PERENNIALS, by Mrs. Loudon. Complete in 32 Half-Crown parts, in good condition, price 2l. 15s.—Apply to G. Arnold & Co., Newspaper Agents, 20, South John-street, Liverpool.

Second Edition, with 64 Engravings, price 2s. 6d., cloth, gilt edges.

GARDENING FOR CHILDREN.—Edited by the Rev. C. A. Johns, author of "Forest Trees of Britain," &c.

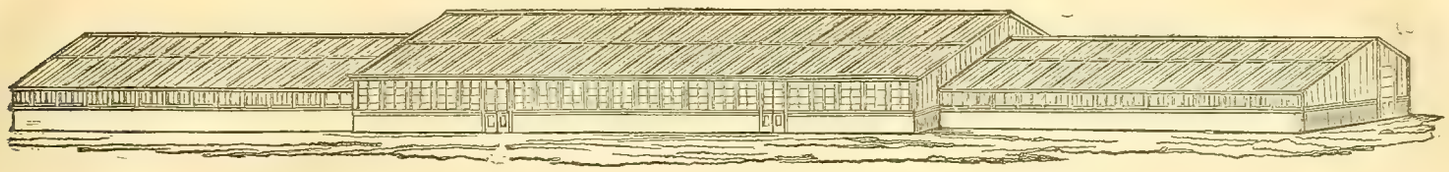
Appendix.—List of Flowers suited to Pots in Windows—List of Tools necessary in an Ordinary Garden.

London: Groombridge and Sons, Paternoster-row.

METCALFE and Co's NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1s. An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at Metcalfe, Bingley, and Co's, Sole Establishment, 130 B, Oxford-street, one door from Holles-street.



METCALFE'S ALKALINE TOOTH POWDER, 2s. per box.

Caution.—Beware of the words "From Metcalfe's," adopted by some houses.

# GRAY AND ORMSON,

## DANVERS STREET, CHELSEA,

**Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.**

Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 16 ft.

[ERECTED FOR JOHN SHAW LEIGH, ESQ., LUTON HOO.]

Extract of a Letter from Mr. FRASER.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, JOHN SHAW LEIGH, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct.

(Signed.) "JAMES FRASER, Gardener, Luton Hoo Park."

---

---

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

---

TO NURSERYMEN, FLORISTS, AND OTHERS.

TO BE LET, on LEASE of 40 years, a compact well-stocked Nursery, of about 2 acres of good land, about 3 miles from the London markets; and containing a Cottage, three good Greenhouses, three Brick Pits, Frames, and Lights complete, with good connexion in the above line. Established 1823. Rent 40*l.* a-year; the Stock to be taken at valuation. For further particulars, apply personally to J. C., Bedford Nursery, Acre Lane, Brixton, Surrey.

---

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers: Office, 70, Strand London.

---

LINGHAM BROTHERS, 170, Hampton-street, Birmingham, sole Manufacturers of the improved WOOD and ZINC MENOGRAPH, or Label for Garden Borders, Flowerpots, &c., in boxes of 100, &c.. The Zinc Labels are highly approved of for their lasting durability; can be written upon with the greatest ease, and, when dry, a permanent inscription is secured. Directions for use sent with each box, including bottle of Metallic Ink.

Sole Agents in London G. and J. DEANE, Horticultural Implement Warehouse, 46 King William-street, London Bridge.

---

EXHIBITION, 1851.—HOME EVERYWHERE.—TENTS for the MILLION, at BENJAMIN EDGINGTON'S Marquee, Tent, Flag, and Rick Cloth Manufactory, 2, Duke-street, Southwark. A Warehouse, 203, Piccadilly.

The following Second-hand Marquees to be sold reasonably—250 feet by 28, 180 feet by 40, 120 feet by 33, and 150 feet by 20. Netting, Bunting, and Scrims for Fruit Trees.

Emigrant Tents fitted up complete.

---

FISHING AND SHOOTING.—The Advertiser's object (an Officer in the Army, with his Wife and Servant) is to meet with a gentlemanly accommodation, in the midst of first rate Fly-fishing for Trout, and very fair General Shooting, to enjoy which, he would be happy either to board and lodge entirely with a married gentleman, or gentleman farmer's family, and pay 250*l.* per year for the accommodation (a plain but good table being all that is required), or he would take a part of a gentleman's house; but the former, in a gentleman farmer's family, would be by far preferred. Early hours, and near the church, is desirable. Exchange of references, together with an interview, would be best for both parties before any arrangements are entered into; and in order that the Advertiser may be able to judge as to what is offered, the fullest particulars as to locality, &c., are desired.—Address to D. D. D., A. Lawrie, Esq, 10, Charles-street, St. James's-square, London.

---

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG AND COMPANY (LATE W. AND C. YOUNG),

MANUFACTURERS OF IRON AND WIRE WORK, &c.,

22, PARLIAMENT STREET, WESTMINSTER, LONDON;

18, NORTH BRIDGE, EDINBURGH;

72, ST. ENOCH SQUARE, GLASGOW;

1, CASTLE BUILDINGS, DERBY SQUARE, LIVERPOOL;

beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

PRICES.—18 ins. high, 9*d.*; 24 ins., 1*s.*; 30 ins., 1*s.* 3*d.*; and 36 ins., 1*s.* 6*d.* per lineal yard.

| | | | | |

| Or a web of 100 yards, 18 ins. wide, will cost | .. | .. | £3 | 15 0 |
| Do. of 100 yards, 24 ins. wide | .. | .. | 5 | 0 0 |
| Do. of 100 yards, 30 ins. wide | .. | .. | 6 | 5 0 |
| Do. of 100 yards, 36 ins. wide | .. | .. | 7 | 10 0 |

If more or less than a web is required, it would be charged at the same rate per yard.

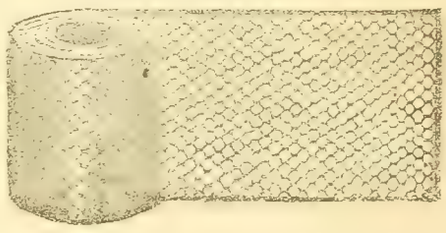
This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. YOUNG and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1*s.* is equal to 21 yards of another article in the market, the same width, at 9*d.* per yard. Samples for inspection sent free of expense.

C. D. YOUNG & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland.

---



TOOTHACHE PREVENTED by using BRANDE'S ENAMEL for filling decaying Teeth, and rendering them sound and painless. Price 1*s.* Enough for several Teeth The only substance approved by the medical faculty, as being unattended with pain or danger, and the good effects of which are permanent.

Sold by all Chemists in the United Kingdom. Twenty really authorised Testimonials accompany each box, with full directions for use. Sent free by return of post by J. WILLIS, 59 Fleet-street, London, in return for thirteen penny stamps.

CAUTION.—The great success of this preparation has induced numerous unskilful persons to produce spurious imitations, and to copy BRANDE'S ENAMEL advertisements. It is needful, therefore, to guard against such impositions, by seeing that the name of JOHN WILLIS accompanies each packet.

---

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

| | | Galvanised. | Japanned Iron. |
|---|---|---|---|
| 2-inch mesh, light, 24-inch wide | ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch " strong " | ... | 9 " | 6½ " |
| 2-inch " extra strong " | ... | 12 " | 9 " |
| 3-inch " light " | ... | 8 " | 6 " |
| 1⅝-inch " strong " | ... | 10 " | 8 " |
| 1⅝-inch " extra strong " | ... | 14 " | 11 " |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

---

ALLSOPP'S EAST INDIA PALE AND OTHER BURTON ALES.—In consequence of a very inferior article being now too frequently sold under the name of these favourite Ales, the public are respectfully requested to apply at the respective stores, where a list of bottlers will be furnished, from whom these ales may be obtained genuine, and where also they may be had in casks of 18 gallons and upwards, either singly or in any quantity. Apply to Messrs. SAMUEL ALLSOPP and SONS, The Brewery, Burton-on-Trent, or their Stores, at 61, King-William-street, City; Cock-street, Liverpool; High-street, Birmingham; the Exchange, Manchester; and 33, Virginia-street, Glasgow.

---

APPETITE AND DIGESTION IMPROVED.

LEA AND PERRINS' WORCESTERSHIRE SAUCE imparts the most exquisite relish to Steaks, Chops, and all Roast Meat Gravies, Fish, Game, Soup, Curries, and Salad, and by its tonic and invigorating properties, enables the stomach to perfectly digest the food.

The daily use of this aromatic and delicious Sauce is the best safeguard to health.

Sold by the Proprietors, LEA and PERRINS, 6, Vere-street, Oxford-street, London, and 68, Broad-street, Worcester; also by Messrs. Barclay and Sons, Messrs. Crosse and Blackwell, and other Oilmen and Merchants, London; and generally by the principal dealers in sauce.

N.B.—To guard against imitations, see that the names of "LEA and PERRINS" are upon the label and patent cap of the bottle

---

HOLLOWAY'S PILLS A CERTAIN CURE FOR BILE, HEADACHES, AND ALSO FOR WEAK AND DERANGED STOMACH.—Incurable diseases affecting the Heart, the Liver, or the Lungs are frequently engendered by inattention to the disordered state of the Stomach, which causes loss of appetite, loss of strength, and loss of energy. To counteract these distressing symptoms, it is only necessary to take a few doses of HOLLOWAY'S inestimable Pills, which will be the means of purifying the blood, and thereby give a healthy action to the vital functions. Their effect on the system is such as to imperceptibly restore to the soundest health even the most weakened constitution.—Sold by all Druggists, and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

COMFORT FOR TENDER FEET, AND A CERTAIN CURE FOR CORNS AND BUNIONS.

PAUL'S EVERY MAN'S FRIEND,

Patronised by the Royal Family, Nobility, &c.

PAUL'S EVERY MAN'S FRIEND, which gives relief on the first application. Paul's Every Man's Friend (Corn Plaister) is generally admitted to be the best emollient application for Corns and Bunions, and is worthy of a trial on the part of those who are afflicted with such unpleasant companions. Testimonials have been received from upwards of 100 Physicians and Surgeons of the greatest eminence, as well as from many officers of both Army and Navy, and nearly 1000 private letters from the gentry in town and country, speaking in high terms of this valuable remedy.

Prepared by John Fox, in boxes, at 1*s.* 1½*d.*, or three small boxes in one for 2*s.* 9*d.*; and to be had, with full directions for use of all wholesale and retail Medicine Vendors in Town and Country. The genuine has the name of "JOHN FOX" on the Government Stamp. A 2*s.* 9*d.* box cures the most obdurate corns. Ask for "Paul's Every Man's Friend"

Sold by Barclay and Sons, Farringdon-street; Edwards, 67, St. Paul's Churchyard; Butler and Harding, 4, Cheapside; Newbery, St. Paul's; Sutton, Bow Churchyard; Johnston, 68, Cornhill; Sanger, 150, Oxford-street; Willoughby and Co., 61, Bishopsgate-street Without; Eade, 33, Goswell-street; Prout, 229, Strand; Hannay and Co., 63, Oxford-street; Watts, 106, Edgware-road; and retail by all respectable Chemists and Medicine Vendors in every town in England. Wholesale Agents for Ireland and Scotland. Messrs. J. and R. RAIMES and Co., Druggists, Edinburgh.

Where a Post-office order accompanies an order for any of the above-named Seeds, J. KERNAN will allow, as discount, additional articles to the amount of 2s. in the pound.
Ladies and Gentlemen relying upon the judgment and experience of JOHN KERNAN, instead of being supplied (as is often the case) with what is neither useful nor ornamental, may depend upon having a selection of the most useful and indispensable Vegetables to the amount named, by the parties forwarding him their orders. The same economy will be observed in the choice of Flower Seeds. J. K. feels it almost needless to observe that the liberality of discount will be with the amount.
Although this list is condensed in the present enumeration, all other new and necessary seeds may be ordered. Gentlemen coming to town, having but one day to remain, wishing to take on return plants of any kind, will greatly oblige by giving one day's notice.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn-place, in the parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their Office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, APRIL 5, 1851.

April 12. (By Order.) JOHN EDWARDS. Hon. Sec.

NATIONAL FLORICULTURAL SOCIETY.

EDWARD GEORGE HENDERSON will exhibit, at the above Society's Meeting, at 21, REGENT-STREET, on THURSDAY, the 24th inst., the new VARIEGATED GERANIUMS he intends sending out the end of this month, "The Bridal Bouquet," "Peach Blossom," and "The Golden Admiration."

E. G. H. will send out at the same time with the above beautiful Geraniums the following new plants, for description of which see back No. of this Paper for March 1, and Catalogue which will be published at the end of this month, and will be forwarded post free on application: Fuchsia "Prime Minister," "Resplendent," "Lord of the Isles," and "Madame Sontag." Geranium Beauty of the Parterre; Potentilla Bicolor grandiflora, and Antwerpensis.

E. G. H. having purchased the entire stock of the beautiful fancy Geranium "Delicatum," raised and exhibited by Mr. Ambrose, and which has been so much admired, will be ready to send it out with the above plants this month. In colour it is the clearest white fancy Geranium yet sent out, with a very bright spot in the upper petals, an excellent grower, a profuse bloomer, and retains its flowers for a long period; indeed, it is so durable that the PETALS wither on the plant. 21*s.* each.

Wellington Road, St. John's Wood, London.

NEW DAHLIAS.

THOMAS BARNES begs most respectfully to invite attention to his superb seedling Dahlias, which will be ready in fine healthy plants by the 1st of May, viz.:

| | *s.* | *d.* |
|---|---|---|
| George Glenny, the best yellow ever offered, and the most constant | 10 | 6 |
| Gem of the East, rose-pink, first-rate and constant | 10 | 6 |

FANCY CLASS.

| | | |
|---|---|---|
| Narcissus Canary, yellow and white | 7 | 6 |
| Paragon, deep buff and white | 7 | 6 |
| Queen of the Fancies, crimson and white, fine | 7 | 6 |
| Symmetry, black and white | 7 | 6 |

T. B. has also an excellent stock of last year's varieties, 24*s.* per dozen; those of former years, 12*s.* per dozen; with Verbenas, Petunias, Phloxes, Chrysanthemums, Fuchsias, &c. &c., of the best kinds, and at moderate prices.—Danecroft Nurseries, Stowmarket.

PELARGONIUMS.—The following Pelargoniums, in 48 sized pots, blooming, well grown plants, are offered at 1*s.* 6*d.* each. Carriage paid to London.

| | |
|---|---|
| Bacchus, Beck's. | Gustavus, Beck's. |
| Cassandra, ditto. | Honora, ditto. |
| Centurion, ditto. | Princess, ditto. |
| Emelie, ditto. | Rosalind, ditto. |
| Governor, ditto. | Rosamond, ditto. |
| Gulielma, ditto. | Zenobia, ditto. |

Many other fine varieties, blooming Plants, 9*s.* per dozen.

THOMAS RIVERS, The Nurseries, Sawbridgeworth, Herts.

AUGUSTE VAN GEERT, NURSERYMAN, Ghent, Belgium, begs to inform the Amateur, and Trade in general, his new CATALOGUE OF PLANTS FOR 1851, is just published, and may be had on application of Mr. R. SILBERRAD, 5, Harp-lane, Great Tower-street, London.

FORGET-ME-NOT.

MYOSOTIS AZUREA GRANDIFLORA.—This unique variety stands unrivalled for its colour and habit, being very superior to the older sorts of that lovely flower, the Forget-me-not; it also possesses the following good qualities over them: The flowers are much larger, perfectly hardy, and will stand for many years in the same situation; it is a lively blue, and grows about 9 inches high, producing hundreds of blooms on the plant at a time; flowering from June till October, it will be found very useful for planting on rockwork, making a bed, or forming edgings; being a colour much wished for, as there is a great deficiency of dwarf blue flowers for autumn blooming. The Seed of the above is now ready to be sent out, at 2*s.* 6*d* per packet. Also the following varieties of Flower Seeds can still be had: Hollyhock Seed, 2*s.* 6*d.* per packet of 150 seeds; German Aster Seed, 1*s.* per packet; Sweet-William Seed, 1*s.* per packet; Antirrhinum Seed, 1*s.* per packet; and also the other varieties of Seeds named in the former Advertisement in this Paper on the 5th of April. The whole or any part of the above sent postage and package free. A remittance must accompany the order, either in cash or penny postage stamps, for the amount.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath.

NEW AND SUPERB YELLOW DAHLIA, WHITMORE'S VICTORIA REGINA, bright yellow, lightly tipped with rich brown, large size when well grown, exquisite in form and petal; closely shaded, it becomes clear yellow. See *Gardeners' Chronicle* of September 28, 1850.

S. W. has much pleasure in announcing that the above beautiful Dahlia has fully proved itself to be one of the most constant flowers extant, as it was grown for three seasons before being sent for Dr. Lindley's inspection. Strong plants the first week in May, 10*s.* 6*d.* All orders will be executed in strict rotation. The usual discount to the trade. The list of Nurserymen who may consent to be agents will be published shortly.

S. WHITMORE, Ford Nurseries, Newport, Isle of Wight.

CHEAP DAHLIAS.

HENRY LEGGE begs to inform the Floral Public that he intends sending out, in May next, all the leading Flowers of 1850, at 9*s.* to 12*s.* per dozen; all the good old varieties, from 3*s.* to 4*s.* per dozen. Ground Roots cheap of most of the favourites. Catalogues can be had, on application, by inclosing one postage stamp to HENRY LEGGE, Marsh Side, Lower Edmonton, Middlesex.

FIRST-RATE NEW SEEDLING CINERARIAS. Rogers's Lady Vernon, good plants, 10*s.* 6*d.*; Rogers's Handel, 7*s.* 6*d.* The above, having bloomed this spring, so satisfactorily, they are most confidently recommended. Twelve extra fine varieties, 24*s.*; and the above two added, 34*s.*; 12 good kinds, 9*s.* to 12*s.*

FIRST-RATE PANSIES.—Hunt's Helen, Turner's Mrs. Beck, Thomson's Polyphemus, Lane's Emma, Hooper's Lady Franklin, Do. Neptune, Major's Magnificent, Thomson's Caroline, Do. Elegant, Walters' Village Maid, Rogers' Uttoxeter Hero, France Cycole. The above 12 for 18*s.*

Hunt's Helen, Turner's Mrs. Beck, Duke of Norfolk, Polyphemus, Major's Blue-eyed Maid, Blue Perfection, Walters' Village Maid, Lucy Ashton, Hooper's Nassau, Hooper's Bellona, Duchess of Rutland, Lord J. Russell. The above 12 for 12*s.*

Mitraria coccinea, 1*s.* 6*d.* to 2*s.* 6*d.*; Tritonia aurea, 5*s.*; Escallonia macrantha, 5*s.* to 7*s.* 6*d.*; Cantua pyrifolia, 2*s.* 6*d.*; Dielytra spectabilis, 3*s.* 6*d.*; Epiphyllum Russellianum, 2*s.* 6*d.* The six for 18*s.*

Six bulbs of Achimenes, including longiflora alba, 6*s.*

G. R.'s stock of Pansies is large, and he can supply the trade at low prices, in quantity.

The Descriptive List of Cinerarias, Pansies, Dahlias, Verbenas, Fuchsias, &c., is now ready, and may be had on application.—GEO. ROGERS, SEEDSMAN and FLORIST, Uttoxeter, Staffordshire.

VALUABLE VEGETABLES.—CAULIFLOWERS.—Myatt's improved early, much earlier than the old varieties, more compact and heavier, considered by the raiser as most desirable, quantity very limited; 1*s.* packets.

BRUSSELS SPROUTS, improved variety, direct from Brussels; 1*s.* per oz, 6*d.* per packet.

CABBAGE, MITCHELL'S ENFIELD.—This has been tried at the Horticultural Society's Garden, and pronounced one of the best; 1*s.* per oz, 6*d.* per packet.

CABBAGE, CHAPPEL'S COLEWORT, excellent for Winter Greens, 6*d.* per oz.

CARROT, ST. JAMES', one of the best for small gardens, and shallow or heavy soils; 3*d.* per oz.

CELERY, COLES' SUPERB RED, very extensively grown last season, and pronounced first-rate; 1*s.* per oz., 6*d.* per packet.

LETTUCE, VICTORIA CABBAGE, but little known, but one of the handsomest grown, and which no gentleman's garden should be without.

DUNCAN HAIRS, in offering the above selection from his general List, begs to inform his friends that he warrants them to be as described.

109, St. Martin's-lane, Charing Cross, London.

CHOICE AND BEAUTIFUL FLOWER SEEDS.

| | | | |
|---|---|---|---|
| Abronia umbellata, highly-scented | 1*s.* | 0*d.* | per paper. |
| A new and beautiful trailing plant. | | | |
| Coreopsis, marbled, new variety | 0 | 6 | ,, |
| Centranthus macrosiphon, bright pink | 0 | 6 | ,, |
| Salpiglossis grandiflora aurea | 0 | 6 | ,, |
| Schizanthus retusus albus | 0 | 6 | ,, |
| No garden should be without this beautiful Annual. | | | |
| Pansy saved from the best show flowers | 1 | 0 | ,, |
| By Thomson, and other eminent growers. | | | |
| Asters (German), four splendid varieties, bright colours | 2 | 0 | ,, |
| Balsams, 6 beautiful vars., distinct colours | 2 | 0 | ,, |
| Stocks (German), very double, 6 varieties | 2 | 0 | ,, |
| Larkspurs, very double, 8 brightest colours | 2 | 0 | ,, |
| Hollyhock Seed, saved by a celebrated grower, from Chater's best and most brilliant double show flowers | 1 | 0 | ,, |

To be had of WILLIAM DENYER, Seedsman and Florist, 82, Gracechurch-street, near the Spread Eagle, London.

N.B. A Dahlia List, just published, containing all the new and choice varieties, may be had on application.

PELARGONIUMS AND NEW PLANTS.

HENRY GROOM, Clapham Rise, near London, by appointment FLORIST to HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, begs to inform the Nobility, Gentry, and Amateurs, that his Spring CATALOGUE of PELARGONIUMS and NEW PLANTS is ready, and will be forwarded by post on application.

NEW PLANTS.

AMBROISE VERSCHAFFELT, NURSERYMAN, Ghent, Belgium, begs to offer to Amateurs and to the trade the following NEW PLANTS:—

| | £ | *s.* | *d.* |
|---|---|---|---|

The Great General Catalogue of Plants, &c., may be had free at Mr. R. SILBERRAD'S, 5, Harp-lane, Great Tower-street, London.

WIDNALL AND DAVIS respectfully announce that their two first rate FANCY DAHLIAS, will be ready to send out, the first week in May.

ADMIRATION (Widnall and Davis) rich purplish crimson, tipped with pearly white, centre well up, very symmetrical and constant, 3 ft., 7*s.* 6*d.*

APPROBATION (Widnall and Davis) rich mellow orange crimson, tipped with beautiful creamy buff, a very desirable first class flower, 4 ft., 7*s.* 6*d.*

They can also execute the following in good plants:—

FUCHSIA nigricans, } Linden's two magnificent Peruvian
,, venusta } species, figured in the Flore des Serres, in December, 1849, 3*s.* 6*d.* each.

VERONICA ANDERSONII, a superb plant for bedding or Greenhouse culture, with large spikes of white flowers, delicately tinged with blue. Figured in Paxton's and Lindley's Flower Garden, for March, 1*s.* 6*d.* each, or 12*s.* per dozen.

Packets of Chater's superb Hollyhock Seed, by post, at 2*s.* 6*d.* each.

The present is the time for sowing.

WIDNALL and DAVIS's general list of Dahlias, Pelargoniums, Chrysanthemums, and soft-wooded plants, can be had on application.—Grantchester Nurseries, April 12.

NEW SCARLET PELARGONIUMS.—CONWAY'S KING OF NEPAUL, a bright scarlet, with large globe truss, horse-shoe leaf, habit of Tom Thumb, good for either bedding or pot, 7*s.* 6*d.* each.

CONWAY'S PET SUPERB, a bright pink distinct variety, very dwarf, and pretty for bedding or pots, 5*s.* each.

Flower of the Day, 5*s.*; Commander-in-Chief, 2*s.* 6*d.*; Princess Alice (CONWAY'S), 2*s.* 6*d.*; Cerise Unique, 2*s.* 6*d.*; or the set of six for 1*l.* 1*s.*, basket included.

The following have been selected as choice varieties, namely, Excellence, Gem of Scarlets, Cottage Maid, Trentham Scarlet, Mrs. Mayler, Queen of Summer, Princess Royal, Tam o' Shanter, Ibrahim Pacha, Queen Improved, Tom Thumb's Master, Reed's Scarlet, Royalist, and Punch, at 1*s.* each, or the set of 14 for 12*s.*, basket included.

Prize Fighter Improved, Tom Thumb Improved, or Symmetry, are recommended as very excellent sorts for bedding at 6*s.* per dozen.

The following pink varieties are also offered at 1*s.* each, or the set of nine for 8*s.*, basket included:—Jenny Lind, Pet, Judy, Lucia Rosea, Rosy Morn, Pink Nosegay, Cherry Cheek, Captain Darley, and Princess Alice (Ingram's).

NEW PETUNIAS.

CONWAY'S Lady Rokeby, white, with purple throat, a highly desirable variety, 5*s.* each; Captivation, 1*s.* 6*d.*; CONWAY'S Beauté Supreme is confidently recommended as the best Petunia for bedding, 6*s.* to 9*s.* per dozen.

NEW CALCEOLARIAS.

CONWAY'S Floribunda, a dwarf, free, and constant bloomer, bright yellow, large trusses, well recommended for bedding or pot, 3*s.* 6*d.* each; Multiflora, 1*s.* 6*d.*; and numerous other sorts at 6*s.* and 9*s.* per doz.

VERBENAS.

A large Collection at 6*s.* to 9*s.* per doz.

CONWAY'S Coronata Geranium, pink, with white centre, an early, profuse, and perpetual bloomer, 2*s.* 6*d.* each.

N.B. A large assortment of Fancy and other Geraniums, Fuchsias, Heliotropes, Dahlias, &c.

MARY CONWAY, Earl's Court Nursery, Old Brompton, near London

QUEEN OF DAHLIAS, white, distinctly edged with rosy purple, large, fine form, and constant, has taken first prizes in its class where shown (was named by Mr. GLENNY, and he pronounced it the very best of all our cupped edged Dahlias), will be let out in May, 1851, as far as stock will go, at 10*s.* 6*d.* per plant.

KING OF DAHLIAS (MORGAN'S), and others at catalogue price.—Address to W. KELSALL, Wilmslow, near Manchester.

OUR YORK REGENT PREPARED POTATO CUTTINGS are now ready; all the other sorts named in our former Advertisement can be had on and after the 20th inst. We had our largest crop last year from those we planted on the 20 h of May.—Post-office orders to be made payable to JOHN SANGSTER, Borough Post-office, Newington Butts, London.

HAY, SANGSTER, and CO., April 12.

VERBENAS AND SCARLET GERANIUMS.

J. SCOTT, FLORIST, Bathford, near Bath, can supply the following 24 VERBENAS, well established in small pots with plenty of stock on them: Adelie, Anais, Anacreon, Berouze, Buffon, Boule de Niege, Gloire de Paris, Napoleon Buonaparte, Woodcock's Magnificent, Charmont Zoe, Perrier, Phaeton, Laura, Morphie, Reine Hortense, Silene, Macrantha, President, Iphigene, John Salter, Telemaque, Cyporice, Lamello, Satyr—15*s.* the set, hamoer included; or 12 selected, 9*s.*

SCARLET GERANIUMS: Commander-in-Chief, strong plants, 2*s.* each, or 1*l.* per dozen; Trentham Scarlet, 1*s.* each, or 9*s.* per dozen.—Direct as above.

*** A remittance expected from unknown correspondents by Post-office order payable at Post-office, Bath.

THE BLACK AUSTRIAN PINE (PINUS AUSTRIACA.)

LUCOMBE, PINCE, AND CO., have a large and healthy stock of this most desirable Pine, from 9 inches to 3 feet high, which having been frequently transplanted, are well-rooted and safe to remove: they can offer them, varying according to age and quality, from 20*s.*, 40*s.*, to 60*s.* per 1000 This Pine has been proved to thrive in bleak and exposed places, and in the poorest soils, growing rapidly, and producing dense shelter in places where other trees will not grow; it also thrives well close to the sea, resisting the spray and roughest winds. N.B The present is a very fine time for planting.

Exeter Nursery, April 12.

FIFTY-FOLD KIDNEY POTATO.

JAMES LAKE, NURSERYMAN, &c., Bridgewater, Somerset, begs to inform the public that he is now sending out his Seedling Fifty-fold Kidney Potato, six tubers of which were sent to Dr. Lindley, April 29th, 1850, and produced 312, quality very good; six tubers also sent to Beck, Henderson, and Co., at the same time, produced 580, although grown in poor ground. Price 4*s.* per peck.—London Agents: HURST and M'MULLEN, 6, Leadenhall-street.

J. L. having grown from 15 to 20 lights of Aban's Conqueror of the West CUCUMBER, successfully for three years, can with confidence recommend it to the public as being one of the best kinds in cultivation. Packets containing 12 seeds, 1*s.* each.

GOLIAH STRAWBERRY.

JAMES KITLEY can supply good Plants of his celebrated Strawberry GOLIAH, at the very low price of 7*s.* 6*d* per 100, or 12 Plants, free by post, for 18 postage stamps. Also fine Plants of Dwarf German HOLLYHOCKS mixed, at 12*s.* per dozen; these have all bloomed, and are very double and beautiful. HOLLYHOCK SEED, saved from a fine collection of double varieties, 18 packets, named, free by post, for 5*s.*; ditto mixed, per packet, 2*s* 6*d.* SWEET WILLIAM SEED, from a great variety of beautiful brilliant colours, per packet, 1*s.*

Lyncombe Vale Nursery, Bath, April 12.

DECIDED BARGAINS. — Dahlias, fine show varieties, 6*s.*; Carnations, compeing flowers, 6*s.*; Ditto without names, fine, 4*s*; Alonsoa grandiflora, 3*s.*; Heliotropes, of sorts, 4*s.*; Fuchsias from 1 to 2½ feet, 6*s.*; Ditto, other named sorts, 6*s.* to 9*s.*; Petunias, named varieties, 4*s.*; Ditto, without names, 2*s.*; Pinks, competing flowers, 4*s.*; Ditto, seedlings from named sorts, 3*s.*; Pansies, show varieties, 6*s.* to 12*s.*; Calceolarias, seedlings—fine, 4*s.*; Phlox Drummondii 3*s.*; Verbenas, named, 4*s.*; Ditto, seedlings, 2*s.*

The above are the prices per dozen. Plants sent to compensate for long carriages. General Catalogues forwarded on application to WM. ANDERSON.—Dundee, April 12.

SEED AND HORTICULTURAL ESTABLISHMENT, SUDBURY, SUFFOLK.

BASS AND BROWN'S SEED AND PLANT LIST FOR 1851 *is stamped as a Newspaper, to go free by post, and may be had on application. It will be found to contain the newest and best articles which can be procured, with full description and other useful information.*

Remittances with orders are requested from unknown correspondents. Goods Carriage Free to London, and with all orders of 2*l.* and upwards, articles presented extra. Post-office orders payable to BASS and BROWN or to STEPHEN BROWN.

PORTUGUESE SEEDS.

CURATORS OF BOTANIC GARDENS, and HORTICULTURISTS generally, are respectfully informed that a Collection of Seeds, principally the more interesting and rarer species of the Flora of Portugal, may be obtained of Dr. FRIED WELWITZSCH'S London Agent, Mr. PAMPLIN, 45, Frith-street, Soho. Prepaid applications immediately attended to.

DR WELWITZSCH'S PORTUGUESE COLLECTIONS.

A VERY EXTENSIVE HERBARIUM, collected during the last 10 years in Portugal, is now in course of distribution.—Apply to W. PAMPLIN, Botanical Agent, 45, Frith-street, Soho, London.

CAMELLIA STOCKS FIT FOR IMMEDIATE WORK.

RENE LANGELIER, Clarendon Nursery, St. Helier, Jersey, begs to inform the Public that he has a very extensive stock of the above, fit for immediate grafting, very clean and healthy, well rooted, so as to leave without the pot, consequently much less expense in conveying to any distant place. Price 36*s.*, 40*s.*, and 50*s.* per 100.

The Stock is such as has never before been offered to the Public by any grower.

R. L. has a most extensive collection of Double Camellias at a very moderate rate and reduced price, as will be seen by a Catalogue recently published, in which it is proved that they can stand the climate out-of-doors without protection. The Catalogue can be had of R. L. by inclosing four penny stamps. Remittance or reference from unknown correspondents.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, April 12.

NEW DAHLIAS; E. FOSTER'S, Esq., CHOICE PELARGONIUMS; PICOTEES, CARNATIONS, HOLLYHOCKS, PANSIES, &c.

WILLIAM BRAGG, Star Nursery, Slough, begs to say his Catalogue of the above Flowers is now ready, and can be had on application. His choice SEEDLING DAHLIAS will be sent out the first week in May at 10*s.* 6*d.* each, viz:—

ADMIRAL, rich lilac, very constant, gained first Seedling prize, 25*s.*, at the Royal South London Exhibition; 21*s.* Shacklewell Open Show, &c, fourteen first class certificates; the most successful flower of the year.

CARMINA, rich carmine, constant show flower, gained six first class certificates, &c., shown in several winning stands.

The Hon. Mrs. ASHLEY, waxy white, tipped with rose, splendid show flower. &c. W. B. thinks it the best Dahlia of the season; was awarded by Dr. LINDLEY a certificate of merit at the Horticultural Society, &c. Gained five first class certificates.

QUEEN OF FAIRIES, Domeyer. W. BRAGG has purchased the stock of this fine and constant fancy Dahlia, from the above amateur, who will give 5*l.* in prizes the next season for this flower. It gained a Seedling prize and first class certificate, with Edwards's Mrs. HANSARD; at the Royal South London Open Show Exhibition five first class certificates.

W. B.'s stock of Picotees, Carnations, and Pinks are strong and good; the best Hollyhock Seed ever sent out can be had in 2*s.* 6*d* and 5*s.* packets, post paid, for prepayment.

AGRICULTURAL SEEDS.

BASS & BROWN'S PRICED AND DESCRIPTIVE AGRICULTURAL SEED LIST may be had free by post. The following of best quality delivered free to London, Ipswich, Norwich, or any station on the same line of Railway.

PERMANENT PASTURE GRASSES, to suit various soils.—Mixtures for soils in general, including proper proportions of Clover, per acre, 24*s.*

Mixtures supplied to suit soils of every description, the nature of the soil being stated; and if intended to be sown either with or without a crop. Any sorts supplied separate, if required, according to order, of which a list of prices of different kinds may be had.

FINE MIXED GRASSES FOR LAWNS, BOWLING GREENS, &c., 40*s.* per acre, 5*s.* per peck, or 1*s.* 3*d.* per lb.

| | | *s.* | *d.* |

The best Stock of Turnips and all other Agricultural Seeds. See our Catalogue. Prices to the Trade on application.

BASS and BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

GRASS AND OTHER SEEDS.

THOMAS GIBBS AND CO., the Seedsmen to the "Royal Agricultural Society of England," corner of **Half Moon-street** Piccadilly, beg to call the attention of their friends to the following Seeds:

Mixtures of selected Natural Grasses for laying down Land to permanent Meadows and Pastures, apportioned to suit the nature of the soil.
Mixtures for portions of Parks near Mansions.
Mixtures for Garden Lawns and Grass Plots.
Mixtures for renovating Old Pasture Land.
Italian, and other Rye-grasses.
White Belgian and Red Altringham Carrots.
Gibbs' new very large Parsnip.
Orange Globe Mangold Wurzel.
Long Red and other kinds.
Drumhead and Thousand-headed Cabbages.
Swedes, Hybrids, and oth r Turnips.
Clovers, Kohl Rabi, French and English Furze.
Sainfoin, Rape, Tares, White Mustard, and all Agricultural and Kitchen Garden Seeds, &c.

Priced Lists are now ready, and will be forwarded free, on application, by post, or otherwise, to corner of **Half Moon-street** Piccadilly, London.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND CO. beg to notice their mixtures of GRASS SEEDS for Laying Land down to Permanent Grass, are now ready for delivery. They have reduced the price to 30*s.* per acre, allowing 2 bushels 12 lbs. to the acre.

Mixed sorts for improving old Grass Land, 1*s.* 2*d.* per lb.

Fine sorts, for forming Lawns, 1*s.* 3*d.* per lb. Directions for sowing will accompany the Seeds.

GEORGE GIBBS and Co. will feel happy in sending general priced Catalogues of Agricultural and Garden Seeds, on application to 26, DOWN-STREET, Piccadilly, London.

GRASS SEEDS.

FINEST LAWN GRASS SEEDS, perfectly free from Weeds and coarse Grasses, 21*s.* per bushel, 3*s* per gallon, or 1*s.* 3*d.* per lb, with instructions.

*To insure a pure turf of finest Dwarf Grasses*, Messrs. SUTTON strongly recommend the sowing the above seeds, whereby the great expense of cutting, carting, and laying Turves may be avoided.

*Quantity of Seed required to form new Lawns*, 40 lbs. per acre (*i. e*, 1 lb. to every 4 poles); or 10 lbs. per acre sown immediately *upon old Lawns* will greatly improve them.

All orders above 10*s.* are sent carriage free to London, Bristol, Southampton, &c.—Address JOHN SUTTON and SONS, Reading, Berks.

AGRICULTURAL SEEDS.

WOODLANDS NURSERY, Maresfield, near Uckfield, Sussex.

WM. WOOD AND SON respectfully solicit attention to their very superior stock of MANGOLD WURZEL, which is warranted of the best description.

| | Per lb.—*s.* | *d.* |
|---|---|---|
| Yellow Globe Mangold Wurzel ... ... ... ... | 0 | 6 |
| Long Red ditto ditto ... ... ... ... | 0 | 6 |
| White Carrot, fine stock ... ... ... ... ... | 0 | 9 |
| Long Red Carrot, for field culture ... ... ... | 1 | 0 |
| Rivers' new Stubble Swede Turnip, very fine ... | 2 | 0 |

N.B.—Turnip and all other Agricultural Seeds at the most reasonable prices.

PERMANENT PASTURE GRASSES, *Mixed expressly to suit the soil for which they are required, at the reduced prices of 22s. 6d. to 28s. per acre, viz.:*

| | £ | *s.* | *d.* |
|---|---|---|---|
| BEST MIXTURES for laying down Land to permanent Meadow or Upland Pasture, per acre ... | 1 | 8 | 0 |
| DITTO, for laying down Reclaimed Marshes and Common Inclosures, per acre ... ... ... ... | 1 | 2 | 6 |
| DITTO, for Irrigation or Water Meadow, per acre ... | 1 | 6 | 0 |

SUTTON'S RENOVATING MIXTURE, consisting of Perennial Clovers and fine Grasses, for improving old Parks, Meadows, and Upland Pastures.

JOHN SUTTON and SONS *having reduced the price of these Seeds 25 per cent., viz., to 10d. per lb., or 1s. 6d. per gallon, great improvement in Pastures, &c., may be effected at a small cost, by the application of 6 or 8 lbs. per acre, sown immediately upon the old Turf.*

We are almost daily receiving unsolicited the most gratifying letters from our customers, in praise of our Seeds; and though we refrain from *publishing names* unnecessarily, we have much satisfaction in quoting the following:—

*From a Member of the Council of the Royal Agricultural Society.*

"Messrs. SUTTON,—I was particularly pleased with your Grass Seed, which I employed by itself, for laying down some fresh broken-up Land. It became a close fine sward by August. I have now about 30 acres of land to sow immediately, &c., &c., and shall be glad of your advice for the purpose."

*From the Land Steward at a large Estate in Hampshire.*

"All the kinds of Grasses sown separately grew admirably; and the 20 acres of Park laid down with *your Mixture* last spring is most excellent. We are anticipating a large crop of Hay, and I can see by the various habits and successional growths of the several kinds, that we shall always have a fresh growing bite for the cattle after the Hay is cut. The Clovers too I see are plentiful."

*From a Clergyman in Dorsetshire, an eminent Agriculturist and Member of the Royal Agricultural Society.*

"I have had the pleasure of praising your Seeds in many quarters beside that to which you refer. This I have done from a sense of justice only."

*Another Clergyman writes us*—"My Turnip crops are the admiration of all the farmers round, especially the Swedes and your Purple-topped Hybrid. I hope you have some of the same kind this year, as I am certain the superiority in my crops is mainly owing to the stocks."

*The above are similar to hundreds of others.*

N.B.—Instructions for Sowing accompany every parcel of Grass Seeds; and any other information required by post will be promptly given.

*Goods delivered free of carriage to any Office in London, Bristol, Gloucester, Exeter, Southampton, &c.*

Reading, Berks, April 12.

SKIRVING'S IMPROVED TURNIP SEEDS.

WM. SKIRVING begs to announce to his friends and the public that he has fixed the price of his IMPROVED SWEDE, and also the PURPLE-TOP YELLOW-BULLOCK, at 9*d.* per lb.

In consequence of W. S. having extended the growth, and having had a very abundant crop of the Seed of his Improved Turnips, he is this season enabled to offer it at the above reduced price, and he is also induced to take this step to prevent Agriculturists being imposed upon by the sale of spurious Seeds, offered at a low rate, under his name.

W. S. can, with perfect confidence, recommend these Turnips as being the best now in cultivation, in every respect, whether for the greatest crop, the best quality, or for keeping, according to the time of sowing.

All other Agricultural Seeds, of the best quality, at very moderate prices. A remittance or reference is requested from unknown Correspondents.

N.B. W. SKIRVING has no Agent in town or country.

Queen-square, Liverpool, April, 1851.

PENNY BEDDING OUT PLANTS.

D. FERGUSON'S Lists for 1851, are now ready, and will be sent free on application. He has much pleasure in stating that his new system of preparing and packing Plants, will enable him to send them with safety to any place that can be reached within a fortnight, (carriage paid to all Railway stations in Britain, when 10 dozen and upwards are taken). The plants will be sent out about the 15th of May; and as he still stands alone offering plants at the price, he invites those who differ from him to visit him about the 8th of May.—Near Buckingham, April 10.

TO CARROT AND WURZEL GROWERS.

G. and J. DEANE are sole Agents for LINGHAM'S PERMANENT LABELS, samples of which, with the Illustrated List of Horticultural Tools, can be sent, post paid, to any part of the United Kingdom.— DEANE'S Horticultural Tool Warehouse, opening to the Monument, 46, King William-street, London-bridge.

ESTABLISHED 1786.

UNDER THE DISTINGUISHED PATRONAGE OF SEVERAL INFLUENTIAL MEMBERS OF THE ROYAL AGRICULTURAL SOCIETY.

WEST OF ENGLAND AGRICULTURAL AND HORTICULTURAL ESTABLISHMENT, for the supply of every requisite for the Farm and the Garden, Union-road, Plymouth (adjoining the Station and Terminus of the South Devon Railway.)

WILLIAM E. RENDLE AND CO., PLYMOUTH, Seedsmen and Manure Merchants, by Special Appointment, to the South Devon Agricultural Association. Warehouses—Corporation Granaries, Sutton Harbour, Great Western Docks, and Union Road. Counting House, Union Road.

*Our Sales of GUANO and LAWES'S PATENT SUPERPHOSPHATE during the last Five Years have exceeded Seven Thousand Tons, and we have made arrangements for Two Thousand Tons to arrive during the present season; our extensive purchases, therefore, enable us to sell at the lowest remunerating prices, and at the same time is the strongest evidence we can offer of the large and increasing patronage bestowed upon us, for which we have to return our most grateful acknowledgments.*

BEST PERUVIAN GUANO.

Warranted to be the direct importation of Messrs. ANTHONY GIBBS and Sons, and to be of the most genuine quality.

LAWES'S PATENT SUPERPHOSPHATE,

Warranted of the best quality, direct from Mr. Lawes's factory.

These are the two leading articles of the day, and can be safely recommended as superior to all other Manures at present known.

WILLIAM E. RENDLE and Co. have been specially appointed by Mr. Lawes to be the Sole Wholesale Representatives for the Sale of his Patent Manures for the counties of Devon, Cornwall, and Somerset; and it cannot be too generally known that they are only to be procured from them, or their accredited Agents, a List of whom can always be obtained.

PRICE CURRENTS ON APPLICATION GRATIS.

*Our Descriptive Catalogue of FARM SEEDS is just published, and can be had in exchange for One Penny Stamp. It contains a description of all the best varieties of Turnips, Carrots, Mangold Wurzel, with prices affixed to every article. The List of Grasses is peculiarly comprehensive, and contains short descriptions of all the leading kinds. There is also some useful advice relative to the Sowing of Grass Seeds for Permanent Pasture, concerning which Mr. Kemp, of Birkenhead Park, in a letter to us, says: "I am glad that you repudiate the practice of sowing corn with Grass Seeds, a custom I have often had to combat."*

All Orders for Seeds above 2*l* carriage free. (See Catalogue.)

Apply to WILLIAM E. RENDLE and Co., SEED MERCHANTS, Plymouth.

*Meeting of the South Devon Agricultural Association, at Modbury, November* 15, 1850.

The following is an extract from the *West of England Conservative* of November 20, 1850:

"In the Show Yard we noticed some splendid specimens of Roots, exhibited by Messrs. William E. Rendle and Co., Seed Merchants, Plymouth. They included some fine bulbs of White, Scotch, and Swedish Turnips, Mangold Wurzel, White Belgian Carrots, Parsnips, &c.; also a collection of Agricultural Seeds, comprising a great many varieties of Grasses, Clover, Turnips, &c.; with samples of all the leading natural and artificial Manures. The roots were exceedingly fine, and would have done credit to the shows of the Royal Agricultural Society, or the Smithfield Club, and for size, weight, and quality, we have never seen them surpassed—some of the bulbs weighing from 18 to 20 lbs. each. We particularly noticed an excellent variety of Swede Turnip, called the Imperial Purple-top, lately introduced by this eminent firm, and is now extensively cultivated by most of the leading agriculturists of the day. It is handsome in form, of superior quality and hardness, and stores longer than any other Swede. Most of the roots were grown with Lawes's Patent Superphosphate, a manure greatly used throughout the country, and acknowledged to stand very high for root crops. The stall attracted much attention, being crowded throughout the day; and great credit is due to W. E. Rendle and Co. for the pains they took in bringing before the Association so fine a collection, thereby adding much to the interest of the show."

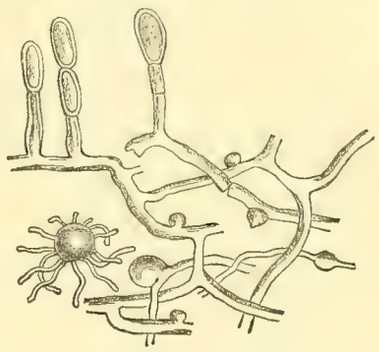
*Exeter Meeting of the Royal Agricultural Society, in July* 1850.

We also had an exhibition of Grasses, Seeds, and Manures, at the great meeting of the Royal Agricultural Society, held in Exeter, July 1850. Our stand (No. 111, as described in the Society's Catalogue), was favourably noticed by all the leading newspapers, at the time. The Grasses were all botanically arranged, and attracted much attention.

*** RENDLE'S PURPLE-TOP SWEDE TURNIP won the first prize at the great meeting of the Cornwall Agricultural Association last autumn.

**The Gardeners' Chronicle.**

*SATURDAY, APRIL* 12, 1851.



MEETINGS FOR THE ENSUING WEEK.

| | | | | |
|---|---|---|---|---|
| MONDAY, | April | 14 | Statistical | 8 P.M. |
| | | | Geographical | 8½P.M. |
| TUESDAY, | — | 15 | Horticultural | 3 P.M. |

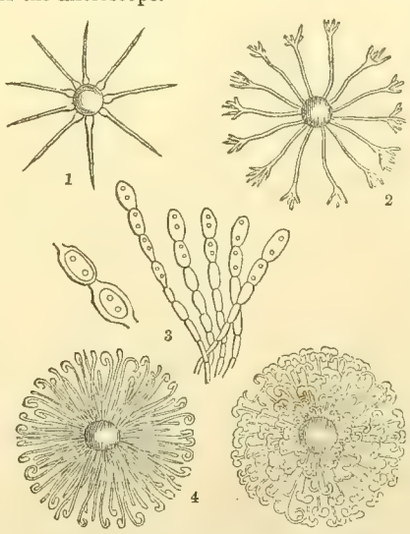
| | | | Ethnological | 8 P.M. |
| SATURDAY, | — | 19 | Medical | 8 P.M. |



IT is one thing to describe accurately the various organic forms which are presented to us in the natural world, and another to understand the relations which they bear to one another. The outward resemblance is sometimes very close, and the real affinity equally small; as, on the contrary, highly different forms are often very closely allied. Instances of this kind occur sometimes amongst higher plants, in consequence of the curious repetition of the same forms in different orders and genera, or even, as in the case of galls, where there is no question of systematic relation: but they are most especially to be found amongst the lower vegetables. Thus, for instance, the young shoots of Mosses and *Equiseta* present the characters of a *Cladophora*, and the infant fronds of Ferns resemble closely some Liverworts. The same law holds in fungi, an example of which occurs in that most destructive plant to the gardener, the white mildew or Mehlthau (mealy dew) of the Germans.

It has been long remarked that the white mildew of Peas, Hops, Roses, and many other plants, is uniformly succeeded by species of the genus *Erysiphe*. Nothing is more easily verified than the fact of this connection in Pea crops, which are peculiarly liable to be infested by the two parasites. Their intimate connection has been long suspected and even openly expressed, but not without incurring unmeasured blame for such apparently rash assertions.

The mildew consists of short white mould-like

articulated threads springing from the stomata, and sending generally a few creeping, often radiating shoots, over the surface of the leaf; the ultimate articulations of the erect threads at length separating and readily germinating. The *Erysiphe*, on the contrary, consists of a globose perithecium passing through various shades of colour, and at length sending off from the base filaments which in the parasite of the Pea are simple, with a rather obtuse apex, but which in other cases vary much in structure, and make the different species great objects of interest under the microscope.

1. Erysiphe guttata; 2. E. penicillata; 3. E. graminis (junior); 4. E. aduncа; 5. E. bicornis.

It is perhaps inattention to the fact of these filaments being developed after the perithecia that has deceived so many observers. If, however, a young patch of the mildew or *Oidium* be examined, some of the very flocci which give off erect threads, bearing at their tips deciduous reproductive cells, after a time present little knots on their surface, very much after the fashion of the tubercular fruit of *Stigonema*. These gradually increase in size till all trace of the thread from which they originated vanishes, and at length begin to emit from their base new filaments, differing altogether from the parent threads. The knots which were at first colourless soon assume a yellowish tinge, then orange, and ultimately olive or deep black, growing meanwhile larger; the threads at their base increase rapidly in length, and eventually terminate in one or more mostly obtuse processes, by means of which the perithecia are frequently raised above the surface of the leaf, and by which it is probable that they imbibe the juices of the infested plant, which are requisite to bring to perfection the mass of asci and sporidia which is developed within.

It is possible that there may be some true species of Epiphytal *Oidium*, which are never developed into *Erysiphe*. There are some, at least, in which the cognate *Erysiphe* has not been observed, as in the case of the Vine mildew. It may, perhaps, be suggested, that the *Erysiphe* is really a parasite on the *Oidium*; but if our observations are correct, the perithecia spring too immediately from the threads, and form too intimately a part of them without any solution of continuity to admit of such a supposition.

Our observations at present have been confined to the Pea mildew, but the matter is too important to pass unnoticed, till full information may be obtained. A caution should perhaps be given to those who wish to repeat the observation in the ensuing season, that from the extreme delicacy of the threads of the mildew, it is far from an easy matter to extricate them, so as to obtain a clear view, and that it would not be wise, therefore, to form a hasty decision from want of success at the first effort.

In very luxuriant patches of *Oidium*, the vegetative power seems exhausted in producing the fertile threads, and no *Erysiphe* is generated.

---

The observations of Professor MITCHERLICH, of Berlin, of which we gave a short account at p. 199, are well deserving of a little consideration. The cellular tissue of plants is not only important, because it answers the same purpose in them as the bones do in the bodies of animals, but the formation and nature of this substance is also of interest, in consequence of its mechanical properties, and the many ways in which it is practically employed in the arts, in the various forms of timber, cordage, linen, cotton, and paper. It is often the case, that a number of different substances, though all more or less related to each other, are classed together under the general name of woody fibre; this, even in common language, frequently leads to mistakes and confusion. There is, in truth, a considerable number of different varieties of woody matter, which may be readily distinguished from each other by their microscopic and chemical properties, but which often occur so closely associated together in the same plant, that it requires some care and attention to separate and recognise them. When a plant is merely crushed, and well washed in water, the soluble substances which it contains, and the greater part of the softer green cellular matter is removed, whilst a portion of fibre is left; but in this way we never obtain pure woody fibre, for it is always contaminated with a quantity of various foreign matters; and on the other hand, if we resort to some chemical process, either employing the solvent power of acid or alkaline solutions; or, as in the manufacture of Flax, allow the plant to undergo a species of fermentation, then in all such cases, the woody fibre is more or less changed and modified by the process to which it has been subjected.

The woody matter, which is formed in a young plant, when examined in the microscope, is found to consist of either cells or tubes, glossy and transparent, but tolerably uniform in structure; after a very short time, however, various other matters are formed and deposited in these cells and tubes, lining and incrusting them throughout in a very curious way. The common woody fibre, therefore, which we obtain by merely macerating and washing any plant is, in fact, a mixture of the pure fibre and these different incrusting substances. From the researches of PAYEN, and other chemists, we learn that there are probably, at least, two distinct varieties of pure woody fibre or lignin, to which the name of cellulose is applied, which differ slightly in their composition, the one being identical in chemical composition with pure starch; and that these two forms of cellulose, when encrusted with three or four peculiar substances which are generated within the cells of the plants, constitute the different varieties of woody fibre. There is very little doubt not only that these two forms of cellulose are convertible into each other, but also that they are formed from starch, and are again convertible into that substance; these conversions, and transformations, are of the highest interest in connection with the theory of vegetation. The experiments of Professor MITCHERLICH show the manner in which pure cellulose may be converted into starch, and dextrine or starch gum, by the action of dilute sulphuric acid, as contrasted with the similar changes which take place naturally in growing plants, and in germinating seeds. Thus solutions of sulphuric acid, and also of certain alkaline salts, convert it into starch and gum, whilst strong nitric acid has no action on it; and though under ordinary circumstances it shows very little tendency to change, yet when exposed to the influence of certain sorts of "ferment," it decomposes with the greatest facility, in fact, far more readily even than starch does; this is shown in a very remarkable manner, in the case of a diseased Potato, in which, owing to the presence of such a ferment, the cellulose softens and is decomposed, whilst the grains of starch, which the cells previously contained, are hardly at all acted on.

There is also another substance, which a good

deal resembles cellulose, and which very often constitutes the walls of vegetable cells, namely cork. The cells of cork, which are sometimes found alone, and sometimes are associated with those of cellulose or true woody fibre, may be readily distinguished from the latter, because the cork cells are not converted into starch by those agents which easily change cellulose into starch; and on the other hand, nitric acid, which has no action on cellulose, acts rapidly and powerfully on cork. In consequence of these properties, there is no difficulty in separating the cork cells from those of true cellulose, as they exist associated together in such plants as the Potato. M. MITCHERLICH also shows that in some cases these two substances are even more intimately connected together, uniting, in fact, to form the walls of the same cell, the corky matter being deposited on the outside of the cellulose; and he imagines that both substances are to be regarded as having a similar origin. From what he says respecting the relation of these two substances, we may fairly be led to ask, is it not possible that cellulose is capable of being converted into cork?

We are not quite satisfied with the experiments which are brought forward to prove that the most delicate vegetable hairs and fibres are all covered with a thin film of cork. It is well known that many fibres, such as cotton for example, imbibe water with great difficulty; but it certainly does not follow that this is caused by a protecting film or varnish of cork; nor is the matter rendered in any way more clear by the further statement that when cotton has been bleached by chlorine, or exposed to the action of some other powerful agent, it then imbibes water with facility, because this process has caused the solution of the thin film of cork, and left the cellulose exposed. As it is acknowledged that these fibres in their natural state always contain more or less of an oily or fatty substance, which would, it is evident, greatly interfere with their being wetted, and as the presence of this oil is certainly quite a sufficient cause for the phenomena in question, they clearly cannot be brought forward without other evidence as any proof of the existence of such a film of cork. It is plain that in many cases cork is formed instead of cellulose, and no doubt for some good purpose; but it also frequently happens that cork is found in large quantities and in parts of plants where its presence appears to do no good. It is probable that in some of these latter cases its formation is the result of disease. We are very glad to see that Professor MITCHERLICH is continuing his experiments on these subjects, and that he is still further investigating the changes which cellulose undergoes when it is acted on by ferments; we hope he will also extend his inquiries on the formation of cork; they cannot fail to lead to interesting and valuable practical results.

## THE ORIGINAL BLENHEIM ORANGE APPLE TREE.

IN a somewhat dilapidated corner of the decaying borough of ancient Woodstock, within 10 yards of the wall of Blenheim-park, stands all that remains of the original stump of that beautiful and justly celebrated Apple, the Blenheim Orange. It is now entirely dead, and rapidly falling to decay, being a mere shell about 10 feet high, loose in the ground, and having a large hole in the centre; till within the last three years it occasionally sent up long, thin, wiry twigs, but this last sign of vitality has ceased, and what remains will soon be the portion of the woodlouse and the worm. Old Grimmett, the basket-maker, against the corner of whose garden-wall the venerable relic is supported, has sat looking on it from his workshop window, and while he wove the pliant ozier, has meditated for more than 50 successive summers on the mutability of all sublunary substances, on juice and core and vegetable, as well as animal and flesh and blood. He can remember the time when, 50 years ago, he was a boy, and the tree a fine full bearing stem, full of bud and blossom and fruit; and thousands thronged from all parts to gaze on its ruddy ripening orange burden: then gardeners came in the spring-tide to select the much-coveted scions; and to hear the tale of his horticultural child and sapling from the lips of the son of the white-haired Kempster.

But nearly a century has elapsed since Kempster fell, like a ripened fruit, and was gathered to his fathers. He lived in a narrow cottage garden, in Old Woodstock, a plain, practical, labouring man; and with his bees and flowers around him, and his "glorious pride," in the midst of his little garden, he realised Virgil's dream of the Old Corycian:—"Et regum equabat opes animis." The provincial name for this Apple is still "Kempster's Pippin;" a lasting monumental tribute and inscription to him who first planted the kernel from whence it sprung.

There are said to be several varieties of this Apple; but the fact is (though contrary to Mr. Knight's opinion), they vary according to the stocks upon which they are worked; those grafted on free stocks are much finer, longer, and narrower than those on Crab stocks, which are more depressed in shape, almost like a skittle-ball, and more orange coloured.

The stone brash and calcareous soil of this part of Oxfordshire, seems to suit the Blenheim Orange, particularly well; and the fruit always appears finer, and more to advantage, in its own native county than elsewhere.

The confectioner's shops and college kitchens in Oxford (not bad judges!) are generally supplied with this handsome and useful fruit, up to Christmas; after which time it loses its flavour, and decays.

This part of Oxfordshire is also celebrated for its Apricots. Every cottage in every village has its Apricot tree, which, in a good season, will pay the rent. All the finest fruit is sent to London, and "Kidlington" Apricots are well known in Covent Garden, and command a higher price than those from other parts of England. *Micklewell Junior.*

## BRITISH SONG BIRDS.

(CAGE BIRDS, No. 9.)

No. XXV.—I HAVE, perhaps, been rather "short," and rather abrupt in my earlier directions for purchasing birds, either males or hens, for the purposes of breeding. I have a great objection in the general way to recommend any particular dealer by name; but I may safely caution people as to where they should *not* deal; and this it is my duty to do.*

Studiously avoid, all ye who go to buy good song birds, such "Babel" shops and wire-workers, such Pantheons and Bazaars, as sell parrots, macaws, monkeys, dogs, &c. The shrieks, hideous outcries, and "unknown tongues" in which these horrible creatures momentarily hold converse, would effectually destroy the value of *any* "song" bird.

I have often remonstrated with the (so-called) bird-dealers, for keeping so heterogeneous a collection of brute beasts; but their answer has been, always, to the effect that—"*ladies* 'cannot live' without dogs, parrots, and such like; they will give *any* price for them." This, alas, *is* too true. We all know it, but too well!

It may be said, that nearly all the bird-dealers in London have these animals on sale. I admit it, and greatly is it to be regretted. All young birds, aye, and even some older ones, *will* copy these strange noises; and the worst of it is, they invariably become stereotyped in their memory. Therefore, let me again raise a warning voice, and caution my gentle readers against *all* dealers in the above monstrosities; urgently recommending the more extensive practice of *private* breeding.

The principal time for the arrival of canaries from Norfolk and Yorkshire, is just before Christmas. They are then sent up in vast quantities, and are, for the most part, lively, healthy, and in good song. With the knowledge of this fact, it will be desirable to call from time to time at the dealers, and purchase your birds *before* their sweet voices shall have been contaminated by foul contact with the wretched parrots, macaws, pugs, poodles, &c., as aforesaid. I often marvel what sort of people those can be, who select *such* animals as these for their constant associates! *Mais chacun à son gout!*

The reason why I have recommended all hens intended for the nursery, to be at least two years old, is this:—It often happens that young, and consequently inexperienced birds, lay their eggs irregularly, and when laid, they will sit for a few hours only, and then incontinently desert them; preferring, naturally enough, the company of their playfellows to the heavier cares inseparable from incubation. All this ends in disappointment, and therefore it is better to run no such risks.

Whenever you observe these acts of neglect and want of motherly feeling, take it for granted that the birds are perfectly unfitted for the purpose of breeding, and remove them at once. You will then introduce others, older and less giddy, in their places. They will speedily find mates after the month of April, especially if a little bruised hemp-seed be scattered on the floor.

To enable you readily to catch any bird you may require, procure a circular hoop-net, of strong string. This should be made deep, and fastened on a circle of stout wire, the whole being affixed to a wooden pole 3 feet 6 inches in length; the bird may then be secured without the slightest fear of any injury to the plumage. A quick eye, and a skilful movement of the hand (to be acquired by practice), will make a prisoner of any one of the inmates in a few seconds.

Canaries have, on the average, three broods a year; some, however, will go to nest four and even five times a year, if permitted. It is unwise to be thus covetous, for the parents are weakened by so much close confinement, and the later offspring are seldom healthy.

When your canaries have laid their eggs, they are subject to constipation, and should have speedy relief. This is best afforded by the introduction of plantain and lettuce seed, for about a couple of days. This, however, should be given sparingly when there are any young birds in the room, as it is quite unsuited to *their* tender stomachs; so also are chick-weed, and other kinds of green meat.

On the 13th day after sitting (in the heat of summer, on the 12th), the hen commences the process of hatching. It is therefore needful *always* to provide in readiness, whether wanted or not, the proper food for the young nestlings. This consists of Rape seed, well scalded, a piece of French roll, dipped in cold water, and afterwards well squeezed; and the yolk of an egg, boiled hard. This must form a paste, neither too solid nor too thin. It must be fresh made, twice daily. If allowed to get sour, the nestlings will assuredly die. The male usually plays "first fiddle" in feeding the young. The mother "assists" only. She feels she has need of repose after her toils, and strives, reasonably enough, to enjoy the *otium cum dignitate*. She is quite to be commended. If the young birds are not affectionately tended by their parents, and it is deemed advisable to feed them by hand, remove them *in the nest*, when eight days old. Dip the end of a short, pointed stick, into the food; and having taken up a small quantity, introduce it into each of the birds' open mouths. Continue this operation every two hours, until the birds feed themselves, which they will soon do. Occasionally, hold the stick quiet; and you will observe that they recognise its use. They will peck at it; and tasting the food, they will be apt scholars in "finding the way to their mouth."

No young birds should ever be removed, when carefully nursed by their parents, until they are at least five weeks old; and their food should be changed gradually. They should then be placed in separate cages, and kept in a warm room, where there is a fine, steady song-bird, ready to act the part of "tutor." At this tender age, their little throats will be found full of music! They begin quite *piano*; their early notes being called "recording." Like the mind of a child, they are open to the earliest impressions; and readily copy, or imitate, whatever they hear. Hence, the great importance of putting them out to a good "preparatory school." Train them up in the way they should go, and you will find that the saying of the "Wise Man," applies even to the feathered race. I am indeed amazed to think, how *very* ignorant we remain in things that ought now to be universally understood! *William Kidd, New Road, Hammersmith.*

* My readers will remember, that in No. XXIII. I cautioned them emphatically against buying birds of *any* kind from people in the street. The necessity for this has just received an additional confirmation. In *Bell's Messenger* of April 5, we read as follows:—"A lady in Liverpool has just purchased, for 5*s.*, *from a man in the street*, 'a sweet little cock canary, with tail feathers radiated like a fan; and of such a deep orange colour!' On examination, however, it proved that the 'cock canary' was a *hen-sparrow*, dyed with saffron, and that its tail feathers were *starched* and *curled!!*"

## NOTES OF A TRAVELLER.—No. XVI.

CHINESE AZALEAS AND AZALEA GARDENS.—Adjoining the Azalea grounds described in my last letter, as being five miles north of Shanghae, is another nursery, which contains a collection of plants very similar to those mentioned at page 5 of the current volume. One plant, however, was in bloom here at the time of my visit, which I must notice. It was a specimen of Glycine sinensis, in a dwarfed state, growing in a pot. The tree was evidently aged, from the size of its stem. It was about 6 feet high, the branches came out from the stem in a regular and symmetrical manner, and it had all the appearance of a tree in miniature. Every one of these branches was now loaded with long racemes of pendulous lilac blossoms. These hung down from the horizontal branches, and gave the whole the appearance of a floral fountain.

There are some more Azalea gardens to the eastward of Shanghae, which I also visited, but as they are much like those just noticed, I shall not describe them here. In all these gardens, the Azalea is propagated readily and extensively. Layering is the common method employed, but grafting and striking from cuttings are also resorted to with success. During the hot summer months, both young and old plants are shaded from the mid-day sun. Most of these new kinds which I have been describing flower early, that is, in March and April; the section to which the A. variegata belongs flowers in May. After the flowering season has passed, the weather is generally moist, owing to a change in the monsoon. It is at this period that the plants grow most luxuriantly, and form their young wood, and this growth is completed and the wood ripened during the fine summer and autumn which follow. These northern Azaleas are exposed to severe colds during the winter. At this season the thermometer (Fahr.) often sinks to within a few degrees of zero, and the weather is not unlike that which we have in England.

The Azalea is indigenous to China, and is found wild on every hill side, like the Heath of our own country. About Hong-Kong and Canton it is only found in a wild state high up on the sides of the mountains, from 1000 to 2000 feet above the level of the sea. In latitude 25° north, in the province of Fokien, it is met with in less elevated situations, that is, from 500 to 1000 feet high; and when we reach Chusan, in latitude 30° north, we find it growing plentifully on the lower sides of all the hills, and never, or at least rarely, at a high elevation. We thus see how plants, which are naturally fitted for the temperature of one part of the globe, can accommodate themselves to another by choosing a higher or lower situation on the hills.

Although this genus is thus found spreading itself over a vast tract of country, yet the northern parts just indicated are evidently those in which it is most at home. All who have been in the island of Chusan, remember how beautiful the hill sides and woods were in the months of April and May, when the Azaleas were in bloom. Every hill was a garden gay with flowers, planted and reared by the hand of Nature herself. Before I saw these hills, I thought nothing could be more magnificent than those gorgeous displays of Azaleas at our flower-shows, and certainly, if we look merely at individual specimens, many of those reared by the skill of English gardeners surpass those which we find in a state of nature. But Nature plants and rears with no sparing hand; her colours are clear and brilliant, and she is not confined to greenhouses and

flower-tents in which to display her productions, but scatters them with wild profusion over the sides of the hills. It is here that she is inimitable, and it is thus she produces effects which, once seen, can never be forgotten. *R. F.*

## FOREIGN GARDEN GLEANINGS.

Imperial Botanic Garden in the Apothecaries' Island.—This garden was founded in 1714, by Peter the Great, and is now under the joint superintendence of MM. Fischer and Naunnenbourg. Some idea may be formed of the large scale on which operations are conducted in this place, when we state that 50 or 60 men are kept in constant employ, and that in his catalogue for 1846 M. Fischer gave a list of no less than 3300 plants, which he proposed for exchange.

The hothouses, constructed on the best principles, cover a surface of 3000 yards in length. Amongst them that containing the Camellias, is worthy of especial notice. The Camellias which are 8 or 10 yards high, are planted in the open ground, and have the appearance of a Japanese forest; other houses contain plants from North America, Nepaul, Japan, all in great variety. Here are the two largest specimens of Rhododendron arboreum in Europe; some large specimens of Tea plants, Proteads, from New Holland and the Cape, and some enormous Leguminous plants.

Another house is full of seeds of Protea, Banksia and Dryandra, from which some interesting varieties may be expected. The Cape Heath house is well worthy of notice for the great number and beauty of the plants it contains. Another house not less beautiful, 50 yards long, and perfectly heated by a thermosiphon with copper tubes, contains a magnificent collection of Orchids; here we find specimens of Cattleya, Dendrobium, Oncidium sanguineum, Stanhopea tigrina, speciosa, and, lastly, of Epidendrum aromaticum (Vanilla planifolia), which fruited in 1847, for the first time, in Russia, since its importation into Europe; its pŏds were, when we saw them, from 4½ to 6 inches in length. The flowers were set by M. Fischer in the way commonly followed in the gardens of western Europe.

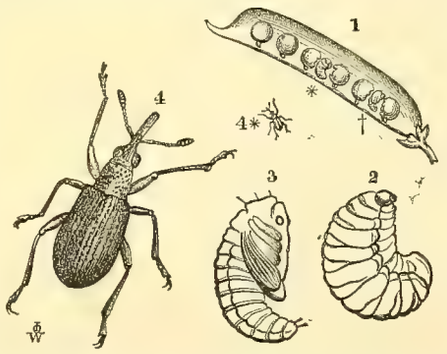
After the Orchids comes the compartment reserved for tropical Ferns, amongst which are some fine specimens. On the same level, and in the same temperature, are the South American Cacti, and a good collection of Agaves, some of which are very rare.

The tropical plants of Java, Madagascar, the Indies, China, Japan, and Nepaul, occupy numerous large houses, and are remarkable for their height, vegetation, and abundance of flowers. The botanic garden contains a collection of Conifers, richer and more beautiful than that at Paris, although at St. Petersburgh many which we cultivate in the open air are there of necessity under cover.

It may be as well to state here that there is always in Russia adjoining every hothouse a dark well closed wooden gallery, called the cold house. This gallery serves to shelter many plants with deciduous leaves, such as Italian Poplars, Horse Chestnuts, several species of Oak, Walnuts, Locust trees, Brooms, Jasmines, Maples, some species of Cytisus, and especially Roses and Honeysuckles.

But we must now turn to the finest house in the whole garden. This house or rather glass palace was begun in 1845, and finished in 1847; it is supported by a strong frame-work, which abuts towards the north on an immense wall destined to shelter it from the wind; its interior is supported by 18 columns; its length is 125 yards, its height 25, and its breadth 33. Its roof is curved so as to admit as much solar heat as possible, and all the iron beams are enclosed in wood, in order that they may be protected from moisture. In the inside is first seen the ground crossed by a winding path in the English style; here are the Palms and large exotics, including magnificent specimens of Sapotads, tropical fruit trees, Dracæna, Fan Palm, Elate, Caryota, Astrapæa, Eugenia, Pandanus, Strelitzia augusta, Musa, Carolinea, and Cycas. A wall five yards in height supports a terrace seven yards broad, partly open, and on which are placed the tropical plants of middling height. Two staircases lead from this terrace to a gallery supported by the 18 columns, and 10 yards above the floor of the house. A few yards higher still is another gallery, in which are placed those plants which require most heat, and from which the tops of the lower plants can be got at and taken care of. From this spot the *coup d'œil* is charming, for below are the finest specimens of the whole vegetable kingdom, and the climbers which seem to flee from the feet of the spectator, descend in every variety of form, and enrich with their gorgeous foliage every part of the vast space below. Above this gallery there is yet a third, used for repairing the roof, and from which a fine view of St. Petersburgh can be obtained.

Such is a slight account of this lovely garden, which is used both for study and and amusement, containing as it does, many water-falls and other objects which please the eye and captivate the visitor. *Masson's Report.*



## ENTOMOLOGY.

### The Pear-shaped Weevils.—No. I.

There is probably no family of insects more numerous, not only in species but in individuals of particular species, or more widely dispersed, than the snout-bearing beetles, to which Linnæus gave the generic name of Curculio, but which now constitute a distinct section, Rhynchophora, or as it is rather considered by some authors a great family, Curculionidæ. They are at once distinguished by having the front of the head produced into a horny cylindrical snout, varying in length and thickness in the different genera, with the mouth at its extremity, the antennæ being generally short, clubbed at the tip, and often elbowed in the middle. Of the extent of the family some idea may be obtained when it is stated that M. Schönherr, the Swedish entomologist recently deceased, published a work of upwards 7000 octavo pages, containing descriptions of the various species, European and exotic, and that additional species are constantly being added to our collections. When it is further added that all these insects are plant feeders, it must be evident that they possess much interest for the botanist and horticulturist.

The history of several obnoxious British species of weevils have already been given in our pages; amongst which we may mention the Pea weevils (*Gard. Chron.*, 1844, p. 388); the Spruce-Fir weevil, Hylobius abietis (*Gard. Chron.*, 1845, p. 456); the red-legged garden weevil, Otiorhynchus tenebricosus (*Gard. Chron.*, 1843, p. 316); and the Vine weevils, Otiorhynchus sulcatus and picipes (*Gard. Chron.*, 1841, p. 292), all of which belong to the short-snouted section. And also the nut weevil, Balaninus nucum (*Gard. Chron.*, 1842, p. 108); the Apple-blossom weevil, Anthonomus pomorum (*Gard. Chron.*, 1844, p. 556); and the corn weevil, or *the weevil, par excellence*, Calandra granaria (*Gard. Chron.*, 1843, p. 907); all of which have an elongated snout.

There is one genus of these insects which contains as many as 70 British species, distinguished by their very small size, the Pear-shaped form of their bodies, caused by the gradual narrowing of the thorax and snout (which is stretched forwards and slightly curved), and by the antennæ not being elbowed in the middle. From their resembance to a Pear in miniature, they have been generically termed Apion; and amongst the species of which the genus is composed are several which are obnoxious to the horticulturist, the larvæ or grubs feeding upon the flowers or seeds, and the weevils themselves upon the leaves of different plants.

Apion malvæ, malvarum, rufirostre, radiolum, oxurum, and æneum, are found in the perfect state upon the different kinds of Mallows, the leaves of which they riddle into holes. One of these species, A. radiolum, is very common in my garden at Hammersmith, where it attacks the Hollyhock (thus proving the natural relationship of the Mallows and Hollyhocks), although a field close at hand is covered with the common Malva sylvestris. Here, therefore, we have an indigenous insect preferring an exotic plant, a circumstance of some interest, as several of our British insects have been regarded as exotic introduced species, because they have been found upon exotic introduced plants. A. radiolum, however, not only eats the leaves of the Hollyhock, but undergoes its transformations in considerable numbers in its stem, arriving at the perfect state in October. Of course the burrows formed within the pithy stem of the plant by the larvæ must be injurious to the plant, and prevent it from producing such fine flowers as it would do if not thus attacked.

Apion melanopum, Spartii and immune, attack the Broom; Apion violaceum, hydrolapathi and rumicis, frequent various species of Rumex; Apion sulcifrons and subsulcatum are found on the Vicia sepium; and Apion viciæ and A. craccæ in the flowers and seeds of Vicia cracca. De Geer (Mémoires vol. v., p. 368, pl. 6, figs. 31—36) has given a short account of the transformations of A. craccæ, the larvæ of which he found feeding upon the seeds within the pods of the last-mentioned plant in July. In the following May he found a dead Apion in one of the pods.

The genus, indeed, appears to possess a decided partiality for Papilionaceous plants; thus Apion vicinum and Loti frequent the Lotus corniculatus; Apion Astragali, the Astragalus glycyphyllus; whilst Lathyrus pratensis is attacked by Apion ervi, lathyri, and subulatum. In the month of August last we received from a correspondent, "Chirurgicus," some pods of the last-named plant, almost every one of which contained one or more small white transparent-skinned, thick, fleshy larvæ, having the body curved, with a small dark brown head. Our correspondent observes, that the depredator had eaten a large hole through the testa, to form a snug cavern for itself. In the seeds of this plant he had failed to discover the perfect insect, the larva apparently escaping from the pod previously to its change, as he had opened many pods and found the seeds eaten, and a considerable hole in the ripe shell. On opening one of the pods, however, I detected the larva feeding leisurely on a couple of the seeds, between which it was lodged, while between the two adjacent seeds I found a pupa, so that it is evident that in this latter case, at least, the insect would not have made its escape from the pod until the following spring, after it had arrived at the perfect state. Our woodcut represents the pod opened (fig. 1.), with the position of the larva indicated by a *, and that of the pupa by a †. The larva itself is magnified in figure 2, and the pupa in figure 3. And although I have not succeeded in rearing the perfect insect, and am consequently unable to decide as to which of the three species above-named, these are the preparatory stages, I have given in figure 4 a representation of the Apion Lathyri, in order to afford a general idea of the appearance of the perfect insects of the genus, and which indeed may possibly be the insect which had attacked these plants.

The perfect insect is one-eighth of an inch long (fig. 4 *), of a black colour, slightly clothed with short whitish hairs; the snout is rather short, the antennæ are entirely of a pale reddish colour; the thorax has an impressed dot behind in the male, and a longitudinal impressed line down the back in the female, and the elytra are rather subglobose in form, with punctured furrows. *J. O. W.*

## Home Correspondence.

*A Garden of Bulbs.*— How universally everybody, even persons comparatively indifferent to gardens, admire the flowers of all bulbous-rooted plants; yet how few gardens among those in the highest keeping make them form anything like a conspicuous feature in the general arrangement. How this happens I know not, nor can I imagine, because the temptation is great; for be it known, that from February to July, aye, even to September, there may be kept up a continual succession of the most neat and lovely, as well as the most gorgeous bloom, according to the taste of the gardener; not that I would recommend an entire reliance on bulbs, for there are many perennials of quite another class, that would wonderfully aid the general effect, and they might be so contrived as to supply those colours which may be most efficient at particular seasons. I am an advocate for bulbs upon the same principle that I am for perennials, apart from their great beauty; that is, for the little trouble they give one. For the most part they need only be disturbed once in three years, and then only because the increase is so great that they want thinning, so also does a perennial; indeed so do most perennials, for they spread their roots in three years into large patches, and require to be parted, or they become uncouth. I have a bulb border; I cannot call it a bulb garden, but it completely eclipsed all the rest of my garden, until, with the increase in the third year, I was enabled to make bulbs a very important feature in the general arrangement, but I will confine my remarks to the bulb border; and although I write from memory and far from home, I will endeavour to convey an idea of its plan, arrangement, and effect. In February and March, the principal subjects are the Snowdrop, the early Daffodils, the brilliant Scilla sibirica, and the Crocus, of which there are several varieties; then I have the white of the Snowdrop, the yellow of the Daffodils, the bright blue of the Scilla, and among the Crocuses the dark purple, the white, the striped, and the golden yellow. Here, then, is but one leading colour deficient; but there are dwarf trees of the Pyrus japonica upon the wall, and they, from Christmas to the end of spring, furnish a great abundance of red. But before my favourite bulbs already mentioned decline, I have early Tulips of many colours—the first of which show their colours before the Crocuses depart, and Hyacinths of many shades in blue, red, and an apology for yellow, and after this the late varieties of the so called early Tulips and the later Hyacinths and the Narcissus tribe assisting them, keep up a complete gallery of beauty all the month of April and part of May. The Iris family, which is immensely extensive, begin to help me, and the late Tulips take their full share of decoration until the Iris become numerous and various, when the Lilies render great service, and continue, with some of these species, to enliven the borders to about the end of summer. Now, during all these months very little aid is required to keep up a full bloom, and I have not once contemplated disturbing the ground, except by hoeing carefully, to destroy weeds, nor do bulbs require watering. I do not conceal the fact that I was a considerable time before I could please myself with the arrangement to keep something like a uniform quantity of flowers always on the border, for it was only 4 feet wide, but I derived infinite pleasure from the changes I made from year to year, and I will also confess that now that I have distributed bulbs moderately in the general borders, I am better pleased with the other part of the garden than with the border dependent on bulbs, except so far as it interests me as an experiment; for they are brilliant additions in early spring, and greatly assist the general effect all the year. At times the bulb border is almost too dazzling, yet I am convinced that I shall in time so regulate it as to secure a good bloom nearly the whole year; at the fall, I now have, to succeed everything, the autumnal Crocuses in variety, and the (so called for many years) Amaryllis lutea, so that there is a fair struggle to keep up the flowers up to winter. My greatest trouble is in keeping the border neat as the various bulbs go out of bloom; but as fast as the stems or leaves turn yellow I shorten them to the part that is a good colour, and thus manage pretty well. I would not go so far as to recommend everybody to try a border of bulbs, but I would

seriously advise them to have in all the borders a few patches (for all bulbs look best in patches), of Snowdrops, Crocuses, Scilla sibirica, and the earliest Daffodils in sixes. A few patches of Hyacinths in threes, early Tulips the same; if these several patches were 10 yards apart they would still do wonders in "lighting up" the garden as it were. I have patches of dwarf bulbs, 6 feet apart all along my border, but as I give all of them fair play, the patches of each family are a considerable distance from each other; all these are within six or nine inches of the edging. Half way between them I have patches of taller bulbs, Iris, Lilies, &c., but I only plant these patches 12 feet apart, so that they come in the centre, but further back between every alternate two of the dwarfs. I may be a little particular, but I place the same kind in all cases opposite each other. I have strongly recommended one of the great importers of bulbs to make out his catalogue for next season, with the names of all bulbs flowering in the particular months, so that a tyro may order exactly what he wishes. There are many bulbs of great interest, but little known by their names; and London seedsmen are generally unable to inform us anything about them; but a descriptive list, with the heights, colours, season of planting, season of bloom, would be valuable. The principal points that require attention in the culture of bulbs are—1st, to have the ground well drained; 2d, to have the soil rich and light; 3d, to plant them before they make the least effort to grow; 4th, not to take them up until the leaves have died down; lastly, while they are out of ground, to protect them against heat, frost, and damp. I feel assured that if those who do not make bulbs a feature in the gardens will but try the effects of a few Hyacinths, a few Crocuses, a few Scilla sibirica, and a few early Tulips, they will very soon desire to add to their list of bulbs. *E. Mordan, St. Dunstanford, N.B.*

*The Chrysanthemum a Spring Flower* (see p. 214).—The plants whose blooms you were good enough to approve of last week were treated as follows, in a few words, for nothing could be much more simple than the actual cultivation. Towards the end of their flowering, and when they began to throw up their new wood, instead of turning them out into a cold frame, I quietly put them into the stove and there kept them from that moment to this. This is the only witchcraft I have used. I may remark that the plants were late and ill bloomed. Two plants only were experimented on, but both succeeded, No. 2 being so very ugly I did not send a bloom. There is a peculiar look of hard dry health about them not easily described, but which you do not see in plants bloomed in our damp autumns. There is not a dead leaf from top to bottom, and fresh budblossoms and blooming wood are being thrown up daily, as if the plant never would leave off. It always seemed odd to me that this plant should be 10 months, more or less, preparing to flower. *Micklewell.*

*The Spanish Chestnut.*—You desire more particulars relative to the merits and demerits of this Chestnut, and you enquire at what age the tree first becomes "shaky;" but I am afraid no definite answer can be given to that question, because amongst the class best qualified by practical experience to give the necessary information, size of tree, and not age, is the criterion by which they are guided. Having been practically employed in the cutting up of timber for several years, as well as in the purchase and sale of it, I need hardly mention that the size of the tree, combined with its other properties, regulates its value, and not its age; however much the latter may be interesting to the man of science, the man of axes and saws can form an opinion of more value to the mercantile world than the philosopher, as to the relative qualities of different trees of the same species. But this is the most deceptive subject that he has to deal with, no outward signs being visible of the mischief which lies within. I have seen young healthy looking trees, with a smooth shiny bark, turn out sadly shaken for a considerable length of the bole, not in concentric rings only, but transversely also to those rings; while, on the other hand, I have seen trees of 50 cubic feet and upwards cut up pretty sound, but the latter are exceptions; not one in a hundred attain that size, and retain their form unimpaired. It is impossible to say at what size they become unsound, as, like many other evils, it comes on by degrees; generally, trees containing less than 20 cubic feet of timber, are tolerably sound, but from that size up to 30 feet the mischief increases very much, leaving hardly one tree in ten free from it at that size, while larger trees are still worse; a sheltered or exposed situation does not seem to affect them; the evil is purely constitutional, and to all appearances not likely to yield to any artificial treatment. When a tree of no great size is wanted for a purpose that requires its full dimensions, or nearly so, as a gate-post, for instance, I entertain no doubt that it will be found equally as durable as Oak, and in every respect as efficient; it is when the saw passes up its centre, or cuts it into smaller portions, that its defects become so apparent; splinters of great length rise up or come off, and the whole, when put to any distressing service, is very likely to give way. It is a matter of regret that such should be the case, for I have no doubt that the timber is, in all other respects, equal to Oak, and it may perhaps even exceed that useful tree in durability, but this I leave others to prove, and content myself by remarking, that the defects mentioned above are such as to place it full 30 per cent. below the value of Oak in a mercantile point of view, and that fact ought to have some weight with planters. *An Old Sawyer.*

*Adamia versicolor.*—People complain that this Adamia does not flower freely. Plants of it treated in the following manner will, I have no doubt, prove satisfactory. Put in cuttings in the beginning of February as soon as they are struck; pot them off into 3-inch pots in a compost of equal parts marl, loam, leaf-mould, and peat, mixed with a little silver sand; place the pots in a Cucumber frame, or a similar situation, for a few days, until the plants have become established, and then remove them to an intermediate house, which I find suits them best; shift them into larger pots as they require it, which will be found to be pretty often during summer, and finally place them in their flowering pots about the end of August. If they have been grown well they will require 11-inch pots at this shift, to make the plants bushy. Moreover, the ends of the shoots may be pinched out two or three times in the course of the summer, but not later than the end of August. After they have had their last shift, place them on an airy shelf in the greenhouse for a month or six weeks; then remove them to the intermediate house, keeping them rather short of water for a time, in order to give them a partial rest. When they begin to grow again, water plentifully, sometimes using weak liquid manure. They will flower in the end of March, and will continue in beauty some time. Cuttings are easily struck in heat under a bell-glass. It is a comparatively new plant, which, in my opinion, is its only recommendation. *J. L. M., Bentham Hill, Tonbridge Wells, March* 27.

*Protection of Rhubarb.*—The advantages of covering Rhubarb with straw, not only to render it more tender in the flesh, but to keep the leaf small, were strikingly exemplified last Monday morning, when the frost took no effect whatever on that protected, while many of the stalks that were exposed burst, and were destroyed; and if the sun had shone strongly, the damage done would have been great. The Plum trees in blossom had all their blooms destroyed by the frost, which must have been severe at about five in the morning. Straw is cheap, and serves three excellent purposes; first, it preserves the Rhubarb from frost, &c.; secondly, it may be used afterwards for Strawberries; thirdly, for manure and for clayey soils it is the best material, for every straw makes a drain before and after it rots. *James Cuthill, Camberwell, London.*

*The Turkey Oak.*—The information that my inquiry with reference to the Spanish Chestnut has elicited, will, I presume, discourage the planting it with a view to its timber: but there was another tree that was adverted to in that inquiry, of which it is also I conceive very desirable to ascertain the quality of the timber: I mean that commonly known as the Turkey Oak (Quercus Cerris) which of late years has been extensively planted, as well on account of its beauty, as its quick growth in soils where the common Oak makes slow progress. There must I imagine be trees of that sort in the country of sufficient age for the testing of their qualities, (indeed I have seen such myself), and if any of your correspondents can furnish information on the subject, they would I conceive be rendering service; I had some conversation, long ago, with the late Mr. Atkinson (whose judgment and taste as a planter, as well as an architect was good), respecting the different sorts of Oak, and my impresion is, that he was inclined to think that it was not merely as an ornamental tree that the Turkey variety was likely to prove valuable. *W. H. April 9th.* [Mr. Atkinson's opinion was, that the wood was excellent for in-door work. We rather think some drawing-room doors were made from it at Penshanger.]

*Deodars.*—I send with this a branch cut from one of the Deodars, about which I asked your advice a few weeks ago. You will perceive how very densely covered it is with foliage; this branch is characteristic of the whole tree. There is no want of vigour, but it has not taken the direction I hoped. In answer to your correspondents, "Pinus Hibernicus," and "H. C.," to whom I am much obliged for their opinions, on the treatment my trees require, I beg to say that the trees are planted in an old garden, still under partial cultivation; but there are no trees of any size or sort near the Deodars. I have submitted some of the Deodars to the ordeal "H. C." and you recommend, as I understood you, for I interpreted your advice to be to thin out the branches, not to cut down the trees. Your expression was, "cut out;" my first impression was, that the fault lay in the richness of the soil; but I have not found that other Pinus have disliked it; it may not, however, suit the Deodar. I hope to report next year the result of the very free use which has now been made of the knife. *J. H.* [Our meaning was to cut down; the specimen seemed to be out of condition, but it bore no evidence of what ailed it.]

*Studs.*—If "A Lady" (see page 216), wishes to become acquainted with the system of "studding walls," with a view to its adoption, allow me to acquaint her that I have been informed, upon good authority, that it was done away with in one of the first places in the United Kingdom, in consequence of the "studs" being found difficult to employ without injury to the trees. *J. T., Bedford, April* 8.

*Oak Wood and Bark.*—I read a request a little time ago in your paper, that some correspondent would publish what the price of Oak wood and bark was last year, and what they were likely to fetch this season. From inquiries in this neighbourhood, I find that the average price of Oak timber of a good size was 2*s.* 6*d.* per foot, and bark 3*l.* 10*s.* per ton, and I think the same prices are likely to be got this season. *A., Peterborough.*

*Stove Aquatics* (see p. 214).—In fact, there is Caspius, and rarely Caspiacus, but never Caspicus. The reason I believe is, that the adjective Caspicum is formed on another adjective, not on a substantive. Indicus is from the substantive India. But there is no substantive Caspia, only Mare Caspium. I think Caspicum is as good as Virginicum, which should rather be Virginianum. *A. H.*

*Size of Conifers.*—The following are accurate measurements of a Deodar growing here: Height, 15 feet; girth of stem, at 3 feet from the ground, 13 inches; lateral branches, at 2 feet, 5 feet 9 inches long; at 4 feet, 5 feet 6 inches long; and at 8 feet, 4 feet 3 inches long. The tree is well furnished with branches on all sides. It has been planted eight years, and it was 4 feet high when it was planted. The soil consists of about 8 inches deep of common garden mould on strong clay. The stem is as straight as a walking stick; it has lost its leader twice, through, I believe, some heavy bird perching upon it, and on both occasions it has been replaced by a lateral, which answers as well as the leader, and from which, in a short time, it is undistinguishable. *G. Taber, gardener, Braxted-park, Witham, Essex, April* 9.

*Seakale.*—In reading your "Calendar of Operations," (from which I get many useful hints) of the 5th of April, I was struck with the following advice: "A succession of Seakale should be brought into the Mushroom shed, or frames, to keep up the supply." I have not required any artificial means for forcing Seakale since the middle of February. In May, 1850, I trenched a piece of ground 2 feet deep, marked out the rows, three in number, 3 feet apart, placed in the centre of each row about 2 inches of rotten dung, covered it with fresh mould, 4 inches thick, and sowed Seakale seed immediately, which grew very strongly during the summer. I covered it about 15 inches deep, in January, with turf mould, from the turf house; and since the middle of February, I have cut a great quantity of most excellent Seakale, without any covering whatever, except turf mould; which I have found, ever since I came to Ireland, to be of great service in gardening, especially in covering Seakale, Rhubarb, protecting plants from frost, &c. *A. Matthew, Moore Abbey, Monasterevan, April* 8.

*Coronilla glauca.*—This, although nearly, if not altogether, hardy, well deserves attention as a winter flowering pot plant. It is not very showy, its colour being a somewhat faint yellow, but it flowers abundantly from any time in the autumn at which it may be wanted, until its services are superseded by the ingress of more gaudy subjects in spring. Its pale green foliage, too, contrasts well with the dark broad leaves of the Camellia. Its great recommendation is, however, the long period in which it remains in full floral beauty, and that during a season when flowers are scarce. I know, indeed, of no plant which equals it in this particular; and I think that this alone affords a sufficient reason for our not altogether turning it out of doors. It is very easily managed, requiring merely shelter to flower it abundantly during the dull months. Suppose we begin with small plants now. Shift them into pots two sizes larger than those they occupy. For soil, take one part turfy peat, one part turfy loam, and one decomposed cow-dung, to which add a portion of sharp sand; mix these intimately together, and use the compost in a rough state. Place the plants in the greenhouse, or in a close pit, and protect them from currents of cold air. You will soon find them disposed to grow vigorously; give them then more air, and, in order to induce them to become bushy, stop such shoots as are inclined to outstrip their neighbours. By the latter end of May you will probably find that roots are plentiful on the outside of the ball; and remember that it is a bad practice to allow the roots of anything to become matted before shifting; therefore, as soon as you discover that the plants have filled the soil with fibres, shift them. If tolerably well treated, they will fill 12-inch pots during the season, or they will flower very well in 9-inch pots; therefore regulate the shift by the size of plant you want; but recollect that the length of time during which they will continue in bloom greatly depends upon their having plenty of pot-room. In shifting, drain well, and use rough soil; and return the plants to their former situation for 10 days, in order to prevent the soil from becoming drenched by heavy rains, and to encourage the plants to push fresh roots. Afterwards, remove them to a warm place out of doors, but sheltered from the morning sun; here they may remain until the time for housing the greenhouse plants takes place, merely requiring to be attended to with water, and to have any rambling shoot which may appear pinched back. They will now be in a fit state for flowering, and may be removed to the greenhouse, or sitting-room window, where they will continue to display their little clusters of sweet-smelling Pea-blossoms all the winter. They require plenty of water at the roots, but dislike a damp atmosphere. When you are tired of them, slightly prune them in, and place them in a cool situation, supplying them rather sparingly with water for a time. When they begin to show a disposition to grow, water more liberally, and they will be the better for a shift into a larger-sized pot; but if that is inconvenient, feed them with manure water. When all danger of frost is over, remove them to their last year's station out of doors. You will find that young plants bloom more abundantly and remain longer in flower than old ones; hence it will be advisable to strike a few cuttings every third season. They root freely if placed under a glass, and kept in a rather cool place. *Amateur.*]

## Societies.

Entomological, *April* 7.—J. O. Westwood, Esq., F.L.S., President, in the Chair. Prof. Zetterstedt, of Lund, was elected one of the honorary foreign members of the Society, and four ordinary members were also balloted for, and elected. In addition to various entomological works presented to the library, a number of beautiful Lepidoptera were sent by Mrs. Vines and Mr. Douglas. Mr. Sam. Stevens exhibited a splendid specimen of Cocytia Durvillii, one of the most beautiful of the clear-winged Sphingidæ, from New Guinea; also a specimen of Gymnancyla canella, of which only a single specimen has been previously taken in this country; also specimens of the curious Dryophilus anobioides, which he had succeeded in rearing from the larva state. The President exhibited living specimens of the larvæ of Œstrus Tarandi (as well as of both sexes of the perfect insect), with which the rein-deer in the Zoological Society's Menagerie in the Regent's Park are at present affected, as many as from 50 to 100 individuals infesting a single animal. He also exhibited figures of the remarkable insect parasitic upon Fulgora candelaria, sent from China, by Mr. Bowring, and which, on examination, proves to be Lepidopterous, being the first instance in which an insect of that order has been proved to be parasitic on other insects. Mr. Maysmor sent specimens of the cocoons of Trichiosoma lucorum, found on Whitethorn hedges. Mr. F. Smith read an extract from Dickens' "Household Words," containing a notice of the remarkable habits of a trap-door-making bee, observed on the banks of the river Essequibo, in Guiana, together with a correspondence he had entered into with the author, explanatory of some portions of the history. He likewise read a notice of a remarkable social wasp's nest, recently presented to the British Museum, the covering, as well as the cells of which, instead of being formed of a papyraceous texture, were composed of particles of sandy loam; it contained six combs of cells, none of which, however, appeared to have yet been occupied by the larvæ. He considered it to have been formed by a wasp, allied to the genus Myrapetra. He also described the nest of another social wasp, Polistes Lanio of Fabricius, in some of the cells of which he had found the insect ready to emerge, whilst in another cell he had found a specimen of the singular Trigonalys bipustulata, a genus respecting the relations of which much uncertainty had hitherto prevailed. A note from Mr. Mackintosh was read relative to insects found impaled on Thorns, spines of Ulex, Araucaria, &c., mentioning several instances in which he had observed that the impalement was caused by the insects being driven violently by the wind against the points of the Thorns, and not by birds, as had been generally supposed. Mr. Spence communicated an extract from an American journal ("The Scientific American," vol. vi.), relative to the habits of the Cicada septendecim, a species which appears to have been satisfactorily ascertained to require 17 years previous to arriving at the perfect state.

National Floricultural, *April* 3.—Mr. Veitch, jun., in the Chair. Forty-four members were elected on this occasion; and the names of 48 more were placed on the lists for election. Large collections of seedlings and named varieties of Cinerarias were contributed by Messrs. Dobson, Smith, Lane, Keynes, Copeman, Henderson, Macintosh, Rogers, Layton, Ivery, Robinson, Gaines, and Parr; Pansies were furnished by Messrs. Bragg and Turner, and by the Rev. C. Fellowes, Norwich; Camellias, Geraniums, Polyanthuses, Auriculas, Hyacinths, Epacrises, Gloxinias, by Messrs. Story, Veitch, Turner, and Henderson; Azalea vittata, by Messrs. Standish and Noble; rosea striata by Mr. Wood. Rhododendrons were communicated by Messrs. E. G. Henderson, Nurserymen, St. John's Wood. The following awards were made: Certificate to a Cineraria, "Queen of Beauties," from Mr. Smith, Tollington Nursery, Islington; this was a white self, of great purity, good in habit and shape. Certificate to Cineraria, "Orpheus," from Mr. Ayres, of Blackheath; this was good in habit and general form; colour, lilac purple, with a light disk. Certificate to Rhododendron "Superbissimum album," from Mr. E. G. Henderson; this had a fine truss of blush white flowers, which were deeply spotted with dark crimson. Mr. Turner sent a promising Pansy, named "National," a white-ground variety. Mr. E. G. Henderson, Cineraria, "Loveliness," a good flower, as was likewise "Christabel," from the same establishment. Mr. Rogers, of Uttoxeter, forwarded "Lady of the Lake," Cineraria; promising, but insufficiently in flower. Mr. Story's Camellia, "Exquisite," had fallen entirely to pieces. Many written instructions were destroyed by using the paper on which they were written as the wrapper for tin and other boxes. Contributors should take care to avoid such errors. A Primula and Polyanthus, in a cut state, were contributed by Messrs. Chater. In addition to the group of Seedling Cinerarias, Mr. Ayres sent several named kinds, among which Madame Miellez, Blue Perfection, Electra, and Adela Villiers, were the most remarkable; also a fine specimen of Pelargonium Quercifolium coccineum.

Botanical, of London, *April* 4.—A. Henfrey, Esq., in the chair. Various donations were announced. The Rev. T. G. Carter, Mr. J. T. Syme, Mr. W. Gourlie, and Mr. P. F. Keir, were elected members. The Secretary exhibited specimens of Ranunculus trichophyllus (Chaix), collected by Mr. J. T. Syme at Dunsorpic Loch, Edinburgh, in June last; also specimens of Myosotis palustris, var. strigulosa (Reich.), collected by the same gentleman at Duddington Loch, Edinburgh, in August, 1850. Other interesting plants, which had been received from members and other botanists, for the ensuing distribution of duplicates, were also exhibited. The Secretary announced that the distribution of duplicates would take place this month.

Montreal Botanical.—This Society was formed on the 27th December last, for the purpose of mutual instruction in the science of botany, investigating the plants indigenous to the country, and the classification and examination of the fruits cultivated in Canada, &c. A library is in course of formation, to consist principally of botanical works, and also the best horticultural periodicals of the day. There are already over 40 members. The meetings are intended to be held weekly during the winter, and monthly throughout the summer, in the hall of the Lower Canada Agricultural Society; and from the success which has attended its operations during the few weeks which have elapsed since its formation, it is hoped that this association will do much to extend the knowledge of plants, as well as foster and encourage horticultural pursuits in this part of the world. The following articles have already been exhibited:—By Mr. Holder, from the greenhouse of J. Torrance, Esq., Leschenaultia formosa and Baxteri; Chinese Primrose, and a red variety of it, fine and well grown; Erica gracilis, Abutilon striatum, Ardisia crenulata, Begonia insignis, Corræa alba, Coronilla glauca, Daphne japonica, Cuphea platycentra, Linum trigynum, Salvia fulgens and leucantha, Malvaviscus mollis and Laurustinus, Camellia Donkelaarii, conspicua, Landwrethii, undulata, eximia, Wataught, Eclipse, double striped, and Wilderii, the latter a first-rate flower, but not superior, so far as observed, to undulata, imbricata, and other old sorts; Sparmannia africana, a handsome early-flowering shrub, with pinkish white blossoms; Magnolia grandiflora; Ficus elastica, or India-rubber plant; Habrothamnus elegans, Epacris impressa and Cooperii, Primula florepleno albo, new, and said to be the first specimen introduced into Canada; Acacia falcata, Chorozema nanum, and Polygala grandiflora.—By R. Norris, Esq., Araucaria imbricata, and Aucuba japonica, or Gold-dust Tree.—By Mr. Cooper, a Camellia, Marchioness of Exeter, and an Auricula.—By Mr. W. Smith, Cote-des-Neiges Village, near Montreal, a specimen, in full flower, of that fine shrub the Nerium oleander splendens, and two Waterloo Hyacinths, all grown in the windows of his house.—By Mr. Allan, from the greenhouse of the Hon. James Ferrier, nine varieties of Mesembryanthemum, including speciosum, candidum, coccineum, and blandum; Cotyledon orbiculata, Sempervivum arboreum; Crassula coccinea; Abutilon striatum and venosum; and Rochea falcata.—By Mr. Carroll, from the greenhouse of G. Desbarats, Esq., Cyclamen persicum odoratum, in full flower.—By the President, a collection of dried plants, including, amongst others, Acacia verticillata, nigricans, longifolia, pulchella, and decipiens; and Dais cotinifolia.—By Mr. Wilson, gr. to P. Holland, Esq., a fine collection of dried Cape Heaths, numbering 103 distinct varieties, all carefully named.—By Mr. Sprigings, from the grounds of H. Corse, Esq., Montreal, Apples; 1, Downton Pippin, winter; 2, White Spanish Rennet, fall; 3, Alfriston, winter, cooking; 4, Fameuse, fall; 5, Winter majetan, cooking; 6, Yellow Bellfleur, fine winter; 7, Ribston Pippin, fine winter, but inferior in flavour, as usual, to those raised in Britain; 8, Sam Young or Irish Russett, most excellent flavour, from November to February; 9, Pack Horse, large and beautiful, but a shy bearer, and scarcely worth cultivation here; 10, Kirk's Lord Nelson, inferior, soon grows mealy; 11, a new Seedling raised by Mr. Corse, winter, a good bearer; 12, Minshall's Crab, fall, very acid; 13, Flower of Kent, large and fine; 14, Nonpareil Russet, flavour first rate; 15, Cornish Aromatic, first quality; 16, Carroll's Seedling, an English Apple, large, a first-rate fruit in all respects, and a good bearer; 17, Hick's Fancy, a small Apple, with a sprightly sub-acid flavour; 18, Beauty of Kent, one of the best; 19, Orange Russeting, worthless; 20 and 21, two new Seedlings, about second-rate. Of the preceding, the Yellow Bellfleur was of excellent flavour, very little inferior to the Fameuse, and worthy of general cultivation. The Nonpareil Russet and Carroll's Seedling were considered two of the best. Mr. Sprigings also showed the following Pears:—1, Duchess de Mars, first-rate flavour, very prolific, and quite hardy (therefore valuable in this severe climate), tree small, slender, and branching, fruit keeps till new year; 2, Josephine, a small hardy Pear, but only second-rate; 3, an old winter French Pear from the Seminary Gardens, Montreal, large, and esteemed for cooking.—By Mr. Holder, from the garden of John Torrance, Esq., Fameuse, Pomme Gris, and two seedling Apples, one of them a fine-looking fruit, large and firm, of a dark red colour, with a high polish, said to be a heavy bearer, and a long keeper. The original tree is standing in the grounds of Mr. Torrance, and has been partly broken down by its abundant crops. The fruit was tasted, and found to be of good flavour; and from the account given of its cooking qualities, it will no doubt rank as a first-class kitchen Apple. The President, with the approbation of Mr. Torrance, named it after that gentleman's residence, "St. Antoine Hall." The Pomme Gris, shown by Mr. Holder, were compared with specimens brought forward by the President, and found to be very different, both in appearance and flavour; and it was stated by Mr. Steele, as his opinion, in which most of the members concurred, that there were two distinct varieties of this Apple, as he had seen them of quite a different character, on the same soil, in the grounds of W. Rodden, Esq. The Secretary exhibited specimens of the wood and foliage of the Balsam Spruce (Abies balsamifera); White Spruce (A. alba); Black Spruce (A. nigra); and the Pitch Pine (Pinus resinosa), formerly called P. rubra, and also sometimes known as the Red Pine. An interesting conversation ensued on the different species of Coniferæ. The President mentioned that the Red Spruce is rare, and is to be found in marshy ground at Three Rivers; that the Black Spruce was originally more common than it is now, having, on account of its value, been much cut down, and that the Pinus resinosa grows almost in pure sand. Whilst I write, the snow is still between 3 and 4 feet deep, and the present has been a most severe winter. Still, the large quantity of snow will prove a valuable covering for many of the tender plants.

## Garden Memoranda.

Ealing Park.—It may be interesting to the lovers of flowers to know that the Amherstia nobilis here has been in blossom ever since Christmas day, bearing a constant succession of beautiful inflorescence, and this day it has 43 flower-spikes upon it, the finest and most beautiful in colour it has yet produced. The foliage is nearly perfect, containing scarcely a burnt leaf; the plant has just had fresh soil put to the roots, and the enormous slate tub has been surrounded by fresh tan. The tree is nearly 14 feet high, and almost 90 feet in circumference round the branches. It is a mistake that it does not burn in its native country. Gentlemen who have known it in India state that they have seen its foliage nearly dried and shrivelled up at Calcutta, while the plant at the same time was covered with flowers. *April* 8.

Compton Verney, the Seat of Lord Willoughby de Broke.—A fine specimen of Dendrobium nobile is reported to be in flower here. It measures from the top of the plant to that of the basket in which it grows, 3 feet 6 inches; it is 12 feet in circumference, and has 37 flower stems, furnishing collectively nearly 1000 blossoms. The same gardens also contain a Begonia manicata, bearing 70 flower spikes. The plant is 5 feet 6 inches high, exclusive of the pot, and 12 feet in circumference. It was in blossom in the drawing-room (where it is now) last year from the first week in February until the first week in May. A Begonia hydrocotylefolia in the same collection is likewise stated to measure 12 feet in circumference, and to have 85 flower spikes on it, together with many more still coming up. *April* 5.

Tetton-house, Taunton.—There is now (April 7), in the garden here a scarlet Rhododendron with 1216 trusses of flowers on it. Each of the trusses consists of from 12 to 18 blossoms. The height of the tree is 9 feet, and the circumference 49 feet.

## Miscellaneous.

*Mr. Phillips' Fire Annihilator.*—A demonstration of the practical utility of this invention in extinguishing fire, took place at Mr. Johnson's Stone Wharf, Millbank, on the afternoon of Thursday last, when its efficiency was tested in three different ways; 1st. On a small wooden house filled with tarred shavings, and other inflammable materials; 2d. On a tank of tar 20 feet long, by 9 feet wide, containing 500 gallons; and lastly, in putting out fire in the hold of a vessel, after the combustible matters, with which it had been furnished, had caused the flames to ascend above the deck. The result of these several trials proved perfectly successful. In each case two No. 3 hand annhihilators were put in action, and the flames were almost instantaneously subdued, so that the efficacy of the contrivance in extinguishing flame, especially on the first outbreak of a fire, may be considered to be established.

*Peat Fuel and Charcoal.*—The following is a copy of Mr. Jasper Rogers' patent for making these. Mr. Rogers remarks, that the mode hitherto employed in preparing and drying peat, causes considerable loss of material from the cutters being obliged to pare off and lay aside the first spongy stratum, in order to obtain the succeeding strata, which are rich in organic matters, and of a consistency which allows of their being dried and formed into blocks; and also, from the friable nature of the peat when dried, which causes the edges, ends, and surfaces to powder away, and from what is termed "mull." To prevent this loss, it is proposed to partially dry the top stratum, by placing the pieces in pyramids on the ground, and mix it with "mull;" afterwards, to complete the drying, and to manufacture the compound into fuel or charcoal, as may be required. The compound is filled into a hopper, which supplies it to a horizontal pipe containing a screw-shaft. This pipe is placed in a hot-air chamber, and is heated by the products of combustion coming from a double furnace situate at the further end of the chamber, which is provided with a chimney about the centre of its length. The end of the pipe, opposite to the hopper, is contracted into the form of a cone, and made to take into a moveable gudgeon, which also sustains on the other side the contracted end of a second pipe, provided with a screw-shaft inside. The other end of the second pipe is also contracted. The two screw-shafts in both pipes are made to revolve by connection with some prime mover. The second pipe is partially immersed in cold water, but not deep enough to admit of water flowing in by the contracted openings at

the ends; and several minutely-divided streams of cold water are caused to fall on the top of this pipe, through perforations in a supply pipe. The effect of this arrangement is, that the compound is forced round and through (by the revolution of the screw-shaft) the first pipe, whereby it will be dried. It is next forced through the second pipe, and thereby cooled, without exposure to the atmosphere, which prevents all chance of its being oxidized. The double furnace is made with two sets of moveable fire-bars, one on each side, in order that the carbonised peat may be discharged into a wheelbarrow, and a fresh supply of peat substituted in one furnace, while the fire is still burning in the other. The carbonising chambers are made in the form of pyramids, mounted on wheels, to run in a tank underneath the flue. They are filled with peat, which is ignited and allowed to burn until carbonised, when water is admitted into the tank, and allowed to rise a short way up the sides of the chamber, sufficient to prevent the passage of air through the fire-bars, at bottom, to their contents. When the carbonisation is completed, the water is withdrawn, the chambers run out, the tank emptied, re-filled with peat, wheeled back into position, and the same process repeated. The drying apparatus and chambers are placed in a shed for protection from the weather. *The Architect.*

*Sale of Orchids.*—A small collection, just imported, was sold the other day, by Mr. Stevens, at the following prices:—The Paxton Dendrobe, from 1*l.* to 1*l.* 16*s.*; the Griffith ditto, from 13*s.* to 1*l.* 10*s.*; the Devonshire ditto, from 13*s.* to 1*l.* 16*s.*; the Cambridge ditto, from 1*l.* to 2*l.* 2*s.*; the Farmer ditto, from 10*s.* to 2*l.* 8*s.*; the Gibson, Dalhousie, and other sorts, from 10*s.* to 3*l.* 3*s.* A few fine plants of Saccolabium retusum, fetched from 3*l.* 3*s.* to 7*l.* 5*s.*—the highest price realised on the occasion. Other kinds of Orchids, consisting of Cœlogynes, Cymbidiums, Aerides, Acanthophippium, Camarotis, Phaius, a "yellow" Vanda, &c., fetched from 5*s.* to 30*s.* per lot, of which there were in all 213.

## Calendar of Operations.

*(For the ensuing week.)*

FORCING DEPARTMENT.

PINERIES.—As the season advances, the night temperature may be increased to from 60° to 65°; taking advantage of fine weather to close with a sun heat of from 90° to 95°, and syringing freely all except those plants which are in blossom, or on which the fruit is ripening. Let the state of the soil be frequently examined, to see that it is sufficiently moist beneath the surface, as the repeated syringings will cause a damp appearance, without penetrating sufficiently deep to moisten the whole. VINERIES.—Attend to disbudding, and the thinning of bunches and berries in the successional houses; and make use of the syringe no longer than it can be done with propriety. After the fruit is set, we seldom give more than one good syringing to remove the remains of the blossom, as it is liable to injure the bloom, if used after the berries have attained any size. PEACH-HOUSE.—Maintain a moderate temperature during dull weather, with a rather dry atmosphere. In damp weather it will be necessary to keep up the day temperature with fire heat; giving ample ventilation, to allow of the free egress of evaporated moisture. Keep the green fly in check by fumigating, if the ordinary syringing of the house prove insufficient. FIG-HOUSE.—Figs require an abundance of air, with free exposure to the light; and without these, a plentiful crop of good fruit need not be hoped for. A moist atmosphere, and a liberal supply of water to the roots, are also essential; and if the roots are confined within reasonable limits, every alternate watering during the swelling of the fruit should be of liquid manure. As the fruit begins to ripen, however, the atmosphere should be kept rather drier; and, in damp, dull weather, sufficient fire-heat should be used, to permit the superabundant vapour to escape. Let the later successions be brought on gradually at first, in a temperature by night of from 50° to 55°. MELON PITS.—Excessive moisture, during the setting of the fruit, must be carefully avoided; and, as it is an easy matter to thin them after all danger of damping is over, it is a good plan to allow more to set than will be ultimately wanted. Remove the blossoms as soon as they fade, and do not allow more males to expand than are required, as they tend to weaken the energies of the plants. Seeds of some of the best preserving varieties should now be sown. The adaptability of any kind for this purpose depends upon the colour of the flesh; the "Old Scarlet-fleshed Rock" and the "Dampsha" are those most generally approved of. The flesh of the latter is of a very deep green, and, besides answering for preserving purposes, it is very useful for dessert, more particularly so, as it is one of the latest and best keeping Melons we have seen. It keeps till Christmas.

FLOWER GARDEN AND SHRUBBERIES.

It is a good plan to sow Convolvulus major, Tropæolum canariense, and some other half-hardy climbing annuals, in a frame, in such a manner that they can be easily removed to their permanent situations, at the usual season. The best method is to lay some turves into a frame, with the grassy side downwards. After beating them till quite flat, the seeds should be pressed into the smooth surface 2 to 4 inches apart, and then covered with a little light soil. When ready for moving to the borders, cut the turves with an edging iron into small squares, containing one, two, or more plants in each. In this way they will experience little or no check, and will start into the new soil with much greater freedom than if they had been confined in pots. Sunflowers may be treated in the same way, as they do not like transplanting; and it is desirable to get them into flower as early as possible. As soon as the Primroses and others of the Polyanthus family have done blooming they should be removed from the beds of which they have lately been the ornament, that the ground may be prepared for the summer beauties. The plants which are taken up should be parted and planted in some nice loamy soil in the reserve garden, watered and shaded with evergreen branches till their roots are re-established. In this situation they will prepare themselves for a repetition of their duties next spring. Those who do not possess a stock of these useful plants cannot commence at a better time. Seeds should be sown in the reserve garden of Hollyhock, Dianthus, and other biennials; and also of perennials, especially of those kinds which flower the first season; some of the latter may be sown at once in favourable situations, where they may remain.

FLORISTS' FLOWERS.

No time should be lost with Carnations and Picotees. They ought all to be in their blooming-pots by the latter part of the week. Let the large pots be well drained; we generally place a small quantity of moss over the broken bricks, bones, or whatever we may use for drainage, with good effect; this prevents the soil from running down. If the compost has not been well looked to, as a precautionary measure we would advise a small piece of Potato inserted just below the soil for a few days; should there be a solitary wireworm, which has escaped the previous search, most likely it will eat its way into the Potato, in preference to the pith of the layer—in which case it will be a lucky escape for the amateur. Auriculas, in the south, will soon be in full bloom, and should be carefully shaded from the sun; be careful that they get no check at this critical period, give a tolerable supply of soft water, with plenty of air, to prevent their being drawn. Look well to the soil where Dahlias are to be grown; enrich it well with manure, and prepare everything for the plants when ready.

KITCHEN GARDEN.

Cardoon seeds should now be sown in 3-inch pots, two seeds in each, and plunged near the glass in a close cool frame; the advantages of this method of raising them, over sowing the seeds in the open air, is in the facility which the former affords at planting season; inasmuch as the plants can be arranged according to their sizes, and at the same time all blanks can be avoided. The old method involved considerable difficulty in earthing up, as it frequently happened that a very strong plant grew by the side of a very weak one, and to make the best of the former, the latter was inevitably buried. Parsley should be sown in drills about 12 inches apart, into which a few seeds should be dropped at intervals of 6 inches; the object in view being to remove all excepting the best plants in each patch, as soon as the curl is distinguishable. As those which are left increase in size, every alternate plant should be removed as they are wanted for use, and the ground forked between the remaining plants, to encourage their growth, and so to prevent their running to seed. Soot is a suitable manure for this herb, and is particularly useful in preventing or destroying the maggots, by which this plant is so liable to be attacked. Where there is a large quantity of the spring crop of Broccoli still unused, the late heads should be selected and laid in under the shade of a north wall; and to shorten the interval between the last of them and the earliest Cauliflowers, the latter should be stimulated by frequent applications of liquid manure.

HARDY FRUIT GARDEN.

After removing the superfluous shoots of Apricots, the remaining ones should be carefully examined, in search of the green caterpillar, which not only injures the leaves, but, by eating holes in the young fruit, causes it to gum and grow deformed, or to drop off before it is stoned. When the fruit is set, more is to be feared from their ravages than from either frosts or storms. The surest method of destroying these pests, is by gently pressing the leaves in which they are lodged between the thumb and finger, and afterwards washing the trees with clean water from the engine. It is an old adage, that prevention is better than cure, and to few things does it more truly apply than to the destruction of wasps. At this season, every existing wasp is about forming a nest; and if they are now destroyed, before they have had time to rear the first of their young ones, as a matter of course their innumerable progeny are destroyed along with them. Much loss of fruit will be prevented by offering a penny a head for every wasp caught before a certain date, from the 20th of May to the 1st of June, according to the locality. The distance must of course be limited; but as a large fruit garden is so great an attraction, a two mile circuit will not be too much, in a general way. The disbudding of Peach and Nectarine trees against flued walls should now be proceeded with, removing only a few at a time, and going over them at intervals of a week or 10 days, until all have been removed that are not required for laying in as bearing wood for next year, or for extending and maintaining the tree.

By some unaccountable mistake in last week's Calendar, "*Mitchell's* Prince Albert Rhubarb," was called "*Myatt's* Prince Albert."

State of the Weather near London, for the week ending April 10, 1851, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 17th, 1844—therm. 71 deg.; and the lowest on the 16th, 1847—therm. 20 deg.

## Notices to Correspondents.

BACK NUMBERS: Full price will be given for No. 1, 1848; and No 1, 1848.

BOOKS: *T W G.* Beck's "Florist, Fruitist, and Garden Miscellany."—*P F L C.* M'Intosh's "Greenhouse, Hothouse, and Stove."‡

CALCEOLARIAS: *Mrs. M.* Kentish Hero, Sultan, and Atrofusca, are good kinds for bedding out.‡

COLUMBINE: *Sub.* Mr. Grigor, Nurseryman, Forres, N.B.

CLUB: *Old Sub.* We are not aware that liquid manure tends to increase the evil. The best remedy is to put wood-ashes in the holes along with the Cabbages, &c., at planting time.‡

CYRTOCERAS: *Sub.* You keep them too warm; that is the cause of their buds dropping.‡

FABIANA IMBRICATA: *Mrs. H.* It is hardy about London; but you had perhaps best treat it like a Heath. It may be propagated by cuttings.‡

GARDEN NETS: *B F.* Steep them in a tan-pit; that will give them a "darkish colour, as well as render them more durable."‡

GLASS: *Cartmel.* We should use rough plate. The other question next week ‡

HORTICULTURAL SOCIETY: *A Lady.* Each Fellow of this Society is able to introduce personally one friend, provided with the usual ticket, at half past 12 o'clock; or he may be represented by his wife or sister, provided she is furnished with an Admission Ticket, signed by the Fellow whom she represents. These are the only conditions under which the *entrée* can be gained.

LINUM FLAVUM: *James Charles.* This is an undershrub, and not a herbaceous plant, strictly speaking. But rules are drawn very tight when it is excluded from herbaceous plants if cultivated in this country. It is not a shrub—but, like all undershrubs, half-way between a herb and a bush. What will the committee call Mignonette? an annual? a perennial? a shrub? or what?

NAMES OF PLANTS: *E G* Some Acacia; we will tell you the specific name next week, if the plant has one.—We are still obliged, though most unwillingly, to beg *Redwood* and others to have patience till another week.—*H L.* Mormodes striatum. —*W B.* Akebia quinata.—*T P U.* The Moss called Bryum ligulatum—*Gallicus.* We do not recognise the variety. It looks like a morsel of the Irish Yew, starved in bad soil.—*Sub.* Cytisus canariensis; 2, C. microphyllus. Compare these with Genista tinctoria, and you will see the difference.

OLD PEAR TREES: *Surrey Clay.* You should give them some half rotten stable manure; loosen the border carefully; see that it is well drained; and then begin to renovate them by gradually removing the old shoots and spurs, and replacing them with young wood. It is too late to begin now. Get the border in order in the autumn, and then ask for further advice.

POTATOES: *R W.* Received, and will be noticed at the proper time.

SEAKALE: *A J B.* From what you state we should imagine that the roots are too old. You had better take them up, divide them, and replant them now, or procure fresh plants. Salt is a good manure for Seakale. Apply it after the plants have fairly started into growth.‡

SMYRNA CUCUMBER: *J S.* Al considerable seedsmen keep it.‡

STRAWBERRIES: *A B.* Next week.

TANNER'S BARK: *A Sub.* This is a stubborn, bad material. The best thing you can do is to char it, and then mix it with liquid manure.

TULIP BED: *J P.* We know of no catalogue that will yield you any assistance. You should read that part of our "Calendar of Operations" which relates to Tulips.‡

VERBENAS: *Warner.* Next week.

WALKS: *H B.* We never yet found anything effectual in removing weeds except manual labour. We, however, understand that a process has been discovered concerning which we are making inquiries, the result of which will be communicated in due time.

MISC: *White Rose.* Zinc coming in close contact with the roots of plants will be injurious to them, if it oxidises. The thread-like moss in your pond will not disappear so long as the water is stagnant, unless you cover it with a roof which will exclude light.—*A Lady.* Cold and damp have no doubt caused your Tom Thumb Geraniums to die off in the way you mention. You may divide your double Violets now. ‡

SEEDLING FLOWERS.

AMARYLLIS: *J G, Bath.* A noble dark red flower, with a stripe of white up the centre of each petal.*

AZALEA: *J G.* Apparently a nice variety.*

CINERARIAS: *S W.* Worthless.*—*J and H H, Cork.* Not equal to the kinds now in cultivation about London: 4 is the best.*—*W and D.* 7 is uncommon in colour, but much too small. Of the other three sorts, 13 is, perhaps, the best.*—*E J O J.* All worthless as show flowers.*—*A Kendall.* 1, white, edged with lilac; centre dark; petals broad, obtuse, of good substance, and well arranged; a large bold flower, and a good trusser. 2, purplish crimson self, with a somewhat pale centre; petals broad, and slightly cupped; a nice medium-sized flower. 3, violet purple, with a narrow ring of white surrounding a dark centre; striking and novel in appearance.*—*A V, Mid-Lothian.* White, edged with purple; centre dark; a large and very desirable variety. The mode of packing is excellent.*—*Peto.* All common, and, with the exception of 5, 6, and 9, scarcely worth cultivating.*

PRIMULA: *J C N.* Apparently an improvement on P. nivalis.*

RHODODENDRONS: *W B.* A very handsome truss forming a cone 5 inches wide at the base, and 5 inches in height. Colour white, tinged with pink, and spotted on the upper petals.*

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS,

AS THE

ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by Dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9l. 10s. per ton, or 9l. 5s. in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.

40, Bridge-street, Blackfriars, London.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

MR. J. C. NESBIT, F.C.S., F.G.S., Consulting and Analytical Chemist, Laboratories, 38, Kennington-lane, London.—PRIVATE INSTRUCTIONS in Chemical Analysis, and the most approved methods of making ARTIFICIAL MANURES. Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

GUANO AND OTHER MANURES.—Peruvian Guano of the finest quality; Superphosphate of Lime; Gypsum; Salt; Nitrate of Soda; Moffat's Patent Concentrated City Sewage Manure, and all others of known value.—Apply to MARK FOTHERGILL, 204, Upper Thames-street, London.

DESICCATED ANIMAL MANURE.—This Manure, which has proved so eminently successful in the culture of both Cereal and Green Crops, can now be had of the Manufacturers, J. M'CALL and Co, 60, Spring Gardens, Manchester; RITCHIE and M'CALL, 137, Houndsditch, London; and of all Agents. Price 6l. 10s. per ton, including bags delivered on the rail in Manchester.—Copies of Analysis and Testimonials forwarded post free on application. Agents wanted.

MANURE DEPOT.—PEAT CHARCOAL.

TO FARMERS, AGRICULTURISTS, AND OTHERS.

G. H. FOLEY, Essex Coal Wharf, Lea-bridge, Middlesex, Agent by appointment to the Irish Amelioration Society, for the sale of the above. All needful particulars will be given on application at the above address.

Price of the unmixed Charcoal, 60s. per ton, sacks included. Mixed with Nightsoil, 45s. per ton, sacks included.

HOSE FOR LIQUID MANURE, Fire-engine, and agricultural purposes, made of canvass, lined and coated with gutta purcha; it is about one-third the price of leather or india-rubber, will convey liquids of all kinds under a heavy pressure, it is extensively used at the Government public works; also by the navy, and amongst agriculturists giving universal satisfaction. Testimonials and prices may be obtained of Messrs. Burgess and Key, 103, Newgate-street, sole manufacturers.—London Agents: Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.—Country Agents: Messrs. Ransome and Parsons, Ipswich; Messrs. J and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. S. Wilson, Agent for Scotland.

TRUE YELLOW GLOBE MANGOLD WURZEL SEED, FROM SELECTED BULBS, in quantities of 20 lbs. and upwards, at 6d. per lb.; WHITE BELGIAN CARROT, 9d. per lb.; FRESH IMPORTED LUCERNE, 9d. per lb.; ASHCROFT SWEDE, 9d. per lb.; SKIRVING'S LIVERPOOL SWEDE, 8d. per lb.; DICKINSON'S IMPROVED ITALIAN RYE-GRASS, 7s. 6d. per bushel.

Carriage free to London, Bristol, Southampton, &c.

Address—JOHN SUTTON and SONS, Seed Growers, Reading, Berks.

THE METALLIC PAINT, produced by the Patent Alkali Company, has been extensively used for several years on farm-buildings, iron bridges, roofs and railings, shipping, &c., and it is admitted that it covers a greater surface and stands far better than any other pigment on wood, iron, Abethaw Lime, and Roman Cement. Fine Black, 25l. per ton, and Rich Purple-brown, 20l. per ton.—Offices of the Company, 1, New Broad-street, London.—JOHN A. WEST, Secretary.

**The Agricultural Gazette.**

*SATURDAY, APRIL* 12, 1851.

MEETINGS FOR THE FOLLOWING WEEK.

WEDNESDAY, April 16—Agricultural Society of England.
THURSDAY, — 17—Agricultural Imp. Soc. of Ireland.
WEDNESDAY, — 23—Agricultural Society of England.
THURSDAY, — 24—Agricultural Imp. Soc. of Ireland.

IT is generally admitted that Great Britain is peculiarly adapted for GREEN or FALLOW CROPS, yet their conversion to a profitable account is found to be the main difficulty under our system of large farms. In many districts Wheat, at one period, was only grown, when bare-fallowing was practised, but the tables are now turned and the index is almost pointing in the opposite direction; the circumstances which rendered cultivation under that system remunerative have passed away, and without some change in the management an alteration in contracts will take place. On the best descriptions of land, the actual rise or maintenance of rents, in spite of a decline in the prices of produce, has had more to do with the profitable disposal of the fallow crops, than with the greatly increased production of the grain crops. Whatever may be the number of bushels of Wheat on an acre that we may aim at, or be satisfied and contented with, its economic production will be closely connected with the profitable disposal of such crops as precede it. A maximum crop of Wheat may soon be reached, which in our climate may not be very safe to push beyond, but as the concentration of cultivation progresses, a wide and boundless field is held out to the husbandman in the variety of fallow crops which can be introduced into the rotation, and where he will find ample scope for skill and enterprise.

The interest and anxiety which are manifested at the present moment, in endeavours to extend the cultivation of Flax, are founded on the belief that this crop might, to a small extent, be introduced with advantage in our rotations, not to supersede grain crops, but only to intervene and assist in their successful culture. We are directed to look to Ireland, where, under its shade, *low* farming has flourished to an unparalleled condition; had it not been for the Potato and the Flax crops Irish farmers never had been able to pay such high rents with such a small produce of grain. These crops of themselves are by no means unsuited to the best systems of farming; but when either has been too much relied upon, great hindrance has arisen to the advancement of agriculture. The linen trade has occupied a very prominent branch in the industrial occupations of the inhabitants of the green isle, from time immemorial. At one period it was much more generally diffused over its surface than at the present day. In most districts the weavers were (and are so still) scattered over the country — when trade was dull they betook themselves to the labours of the field to gain a livelihood, but when it was brisk, more was gained at the loom, and, consequently, agriculture was then altogether neglected; a small plot of Flax was grown, and the manufacturing of the produce served to keep a man and his family employed throughout the year. The linen trade in Ireland has been subjected to many ups and downs, which totally overthrew it in some counties, but from which others recovered, and again pushed forward its cultivation under very different auspices. Previous to 1829, Flax was grown over the greater part of Ireland for domestic use, but Ulster and Connaught were the two provinces where the largest export trade was carried on. It is now almost extinct in the latter, and confined to the north of Ireland at the present day.

In 1829 mill-spun yarns were introduced into the Irish markets, and the same quantity and quality of some yarns for which the home spinners had been formerly getting 1s., was sold by the mill spinners for 5d.; under such fearful odds, in a trade where wages were already reduced to the lowest point possible, the spinning-wheel was at once doomed to oblivion, and this revolution in the manufacture completely paralysed the linen trade in Ireland. The introduction of large spinning factories in Belfast in 1830 had the effect of saving the cultivation of Flax in the north, as a market was got for the fibre, and the yarns were again distributed over the country amongst the weavers, to be converted into cloth. By-and-bye it was discovered that much of the fibre produced in Ireland was of a very superior description, and it soon found its way into the English towns, which were in possession of the spinning of fine yarns, and thus a good field was opened up for skill in the cultivation of Flax and its manufacture into fibre.

The Flax is principally cultivated by the small farmers in Ireland, who in many districts are well skilled in its growth and subsequent handling, and in this consists the whole profitableness of the crop. There is no other grown which varies so much in the value of the produce, and holds out more temptingly a premium for careful and intelligent management. Any one may satisfy himself of the enormous difference in the prices which the growers realize, by paying a visit to any of the weekly markets in the north of Ireland, such as Monaghan, Armagh, or Londonderry. One farmer will be selling his produce at 80l. per ton and upwards—he will talk of the times in hopeful terms, and he will without doubt be in a better position to sell his Wheat at present prices, than another who is only getting 28l. per ton; things are sure to be going hard with the latter—thus in the same market you will find very different statements from the growers concerning the utility and advantages of Flax culture, altogether depending on the management of the crop. The introduction of many of the proposed new methods for preparing Flax fibre will be of little service to the small farmers. It is their interest to keep the preparation of the Flax in their own hands.

The mill spinners have had much difficulty in obtaining a regular and liberal supply of Flax of the better qualities. Hitherto the finest Flax has been spun in England, while the coarser kinds have been wrought up in Scotland and Ireland. The two are quite different trades, and the machinery which will do for the one will not answer for the other. The medium price of the Baltic Flax that is at present spinning at Dundee, is only 35l. per ton, the very highest 45l. per ton—but the average price of Irish Flax in the country markets is about 56l. per ton, and some of it brings a very high figure. From this it is very evident that if Flax is to be raised in Britain, fine qualities must be the aim of the growers, as the same amount of labour will be expended whether the produce is good or bad. There is a pretty prevalent opinion at present, that inferior land might be very profitably turned to the cultivation of Flax; in fact, where cereal crops cannot be grown with advantage, it is still believed to be fit for Flax; it is no doubt a crop that will extract nourishment out of a soil, that has been exhausted by others—but it is not under such circumstances that any good results are to be looked for; on the contrary, quantity and quality of fibre (which are not inconsistent with each other) must be the aim and great object of growers; and this will only be obtained by sowing it on sound land and in good condition. In Ireland the best crops are got by sowing on a properly prepared stubble, which has been preceded by lea or a well manured green crop. The manure should not be applied in a moist climate to the crop, as the straw never obtains that rich mellow appearance which is a pretty good test of the quality of the fibre. In Belgium it is often liberally manured, but the greater amount of heat and light counteracts all tendency to a coarse and dull-coloured straw. In fine seasons, a fair quality of Flax may be got on improved bogs, but it is very uncertain, and much of the moorland in Ireland will be capable of growing only the coarsest qualities, until immense improvements are effected on the land. The same conditions of soil are required for Flax as to grow a fine quality of Oat straw; by early sowing on land in proper tilth, which is sound, and not over-rich with manure.

Flax might easily be *grown* to a considerable extent on large farms, but the difficulty is its management and conversion into fibre. Companies are already formed to prepare the straw for the farmers, upon what is known as SCHENCK'S process, which is a mere hastening of the old method, by slightly raising the temperature of the water, and promoting a rapid fermentation, which separates the fibre from the woody stem. The quality of the Flax produced is giving every satisfaction. This holds out some prospect of Flax cultivation being easily engrafted on our present systems; the only difficulty which will be encountered in the outset will be to apportion the value of the crop between the growers and the manufacturers of the fibre, which competition will only secure. Before this can be done, however, the grower would be much better to bargain for the crop before it is sown, than run the risk of not getting a fair price for it after it is grown, or a certain price might be fixed upon for dressing, at so much per stone.

But there is no doubt that it should be the business of the farmer to grow and prepare the Flax himself; the machinery for scutching and dressing might be easily attached to the steam or water power on many a farm. An increased amount of manual labour might be employed on the farm at seasons when it is difficult to find work for labourers, and this would be a valuable reserve to turn out to other operations which demanded despatch. If we were inclined to hazard an opinion, we would say that it is very probable that SCHENCK'S process will come into use where the crops are to be prepared on large farms. The process is exceedingly simple, and the skill would be as easily acquired to manage it, as under the old plan of steeping in pools. Mr. WARNES, of Norfolk, has shown the advantages of Flax culture on an extended scale, and the happy results which flow from it when skilfully carried out; he has demonstrated its successful cultivation in conjunction with all the improved practices of modern husbandry; it has not superseded any of the crops in the rotation, but only been the means of turning the others to a better account; some may do well, in the meantime, to raise a crop for others to prepare the fibre; but until it is manufactured on the farm, and the waste all carefully husbanded for manure, we question much if it will ever lead to such results as many imagine. Mr. WARNES has long been preaching to the nation in earnest strains as to the advantages of Flax culture, but he seems to have only recently got such an audience as are fully determined to sift the matter to the bottom. *R.*

# LIST OF ARTIFICIAL MANURES.

## PART I.—SUGGESTED ARTIFICIAL MANURES FOR SPECIAL CROPS.

| Crop to which the Manure is applied. | Name of Author. | Composition and Cost of the Manure, per acre. | Remarks. |
|---|---|---|---|
| Turnips. | Mr. Huxtable, Sutton Waldron, Shaftesbury, Wiltshire. | 30 bushels wood ashes ..... £0 15 0<br>2 cwt. Ichaboe guano ..... 0 15 0<br>50 lbs. of burnt bones, in 25 lbs. of sulphuric acid } 0 7 0<br>30 bushels sawdust ..... 0 2 6<br>10 lbs. sul. acid over ashes ... 0 1 3<br>£2 0 9 | By the help of this manure Mr. Huxtable raised 23¼ tons of clean roots (Swedes) "upon the most barren and unlikely land in Cranbourne Chase, and almost covered with white rubble, forming a portion of the upper chalk."—*Journ. Roy. Ag. Soc.*, vol. vi., p. 357. See also our *Table* 3. |
| Do. | Mr. Way, Chemist to the English Agricultural Chemistry Association. | 2 cwt. bones, and 1 cwt. sul. acid..... } £0 12 0<br>1 cwt. pearl ashes ..... 0 5 0<br>½ cwt. Epsom salts ..... 0 4 6<br>3 cwt. salt ..... 0 6 0<br>£2 2 6 | This manure has not been tried. It should be used on soil in pretty good condition, as it is deficient in the organic food of plants—the only substances of this sort being the oil and gelatine in the bones. |
| Do. | Mr. J. Hannam, North Deighton, Wetherby, Yorkshire. | 20 bushels of sawdust saturated with gas liquor or urine, and made into compost for 6 months ... £0 5 0<br>2 cwt. bone-dust, in ..... 0 12 0<br>¾ cwt. sulphuric acid ..... 0 10 6<br>½ cwt. sulphate of ammonia 0 8 0<br>£1 15 6<br>N.B. Gypsum or ashes to be added so as to form a drill compost. | This mixture is adapted for common Turnips that are to be consumed on the soil. If they are to be pulled off, 2 cwt. of guano should be added.<br>For Swedish Turnips also, 2 or 3 cwt. of guano, according to quality, should be added to this prescription.<br>The mixture as given has, however, succeeded well on the white Turnip crop, and is extremely economical. |
| Do. | Mr. Gardner, Agent to W. Fleming, Esq., of Barrochan, Renfrewshire. | 5 cwt. Peruvian guano..... £2 10 0<br>3 cwt. animal charcoal ..... 0 12 0<br>1 cwt. sulphuric acid ..... 0 9 4<br>½ cwt. nitrate of soda ..... 0 8 0<br>1 cwt. sulphate of ammonia 0 16 0<br>1 cwt. carbonate of magnesia 0 5 0<br>2 cwt. common salt ..... 0 2 0<br>½ cwt. potash ... 0 6 6<br>¼ cwt. horn-dust 0 8 0<br>(A.) £5 16 10 | In a trial against 30 tons of farm manure, at a cost of 10l. 10s., this mixture gave an increase of 7 tons 9 cwt. of yellow Turnips—the produce of which being as follows:—<br>Tons. cwt. lb.<br>Farm manure, 30 tons..... 31 0 0<br>Mixture A 38 9 0 |
| Do. | Do. | 5 cwt. Peruvian guano..... £2 10 0<br>2 cwt. sulphate of soda..... 0 10 0<br>1½ cwt. sulphate of magnesia 0 7 6<br>2 cwt. animal charcoal ..... 0 8 0<br>¼ cwt. horn-dust 0 8 0<br>2 cwt. common salt ..... 0 2 0<br>3 cwt. kelp ..... 0 15 0<br>(B.) £5 0 6 | In a trial upon Swedish Turnips:—<br>Tons. cwt. lb.<br>30 tons of dung gave 34 5 80<br>Mixture B 42 11 48<br>30 tons of dung cost £10 10 0<br>Mixture B cost ..... 5 0 0<br>—See *Table* 3. |
| Potatoes, No. I. | Mr. Fleming Barrochan, Paisley, Renfrewshire. | 1½ cwt. Rape-dust.....£0 7 6<br>½ cwt. bones in muriatic acid 0 3 0<br>20 lbs. sulphate of magnesia 0 1 6<br>½ cwt. carbonate of lime..... 0 0 4½<br>14 lbs. nitrate of soda..... 0 2 6<br>3 stones of salt 0 0 6¾<br>3 stones of sulphate of soda 0 2 3<br>1 stone sulphate of ammonia 0 2 6<br>½ lb. sulphur ... 0 0 3<br>1½ cwt. dry moss earth<br>£1 0 5¼ | No. 1.—This mixture produced a fair crop of Potatoes, of remarkably fine quality, 43 bolls per acre of imperial Renfrewshire measure, weighing 5 cwt. each, upon a poor, light, although new soil, not worth more than 25s. per acre.—See *Sup. to Professor Johnston's Lectures on Agri Chem.*, p. 64.<br>The mixture is too poor in organic and azotised matter to depend upon for a crop of Potatoes. |
| Potatoes, No. II. | Mr. Fleming Barrochan, Paisley, Renfrewshire. | 40 bushels sawdust ..... £0 0 0<br>10 bushels potash and lime, 14 months old 0 7 6<br>1½ cwt. salt..... 0 2 3<br>1 cwt. sulphate ammonia..... 1 0 0<br>½ cwt. sulphate soda ..... 0 3 6<br>½ cwt. sulphate magnesia ... 0 4 0<br>20 gallons coal tar..... 0 10 0<br>£2 7 3 | This is a better mixture than No. 1, and gave a better crop. See *Table* 3.<br>The Potatoes were "very luxuriant in foliage," says Mr. Fleming (Johnston's Lectures, Appendix, p. 64); they yielded, (he adds) 56 bolls per acre of very fine Potatoes, many of which weighed from 2¼ to 30 oz. each. |
| Potatoes, No. II. | Mr. Gardner, Agent to W. Fleming, Esq., of Barrochan, Paisley, Renfrewshire. | 6 cwt. guano...£3 0 0<br>2 cwt. animal charcoal ..... 0 8 0<br>1 cwt. sulphuric acid ..... 0 9 4<br>3 cwt. horn dust 0 6 0<br>2 cwt. muriate ammonia..... 1 10 0<br>1 cwt. sulphate of soda ..... 0 5 0<br>1 cwt. carbonate magnesia..... 0 5 0<br>2 cwt. common salt ..... 0 2 0<br>£6 5 4 | This mixture is very similar to Mr. Gardner's Turnip mixture. The quantity of each ingredient is, however, larger than for Turnips. The saline matters are also a little varied.<br>The animal charcoal used by Mr. Gardner, in nearly all his mixtures, is the remains of bones charred in close iron vessels; the animal matter is, therefore, nearly all destroyed. A small portion of nitrogen, however, is retained; and the earthy part of the bone, of course, still remains. |
| Wheat. | Mr. Way, Chemist to the English Agricultural Chemistry Association. | 2 cwt. silicate soda,<br>1 cwt. bones,<br>½ cwt. sulphuric acid,<br>40 lbs. sulphate of magnesia,<br>35 lbs. carbonate potash. | For the 35 lbs. carbonate of potash Mr. Way says 50 lbs. nitrate of potash may be used, it is to be preferred. This will supply the potash equally well; and at the same time yield nitrogen to the crop. |
| Do. | Mr. Huxtable, Sutton Waldron, Shaftesbury, Wiltshire. | 5 cwt. bones,<br>1 cwt. sulphuric acid,<br>5 cwt. shoddy,<br>3 cwt. salt. | As shoddy is rich in nitrogen, it is a good manure. It may be used as a top dressing, or ploughed in with the seed. If it be partially decomposed before it be mixed, the result will be better. |
| Do. | Mr. Lawes, Rothamsted, St. Alban's, Hertfordshire. | 1. Saline Mixture.<br>106 lbs. phosphate magnesia,<br>80 lbs. phosphate soda,<br>110 lbs. silicate potash,<br>80 lbs. sulphate ammonia,<br>350 lbs. superphosphate lime. | This mixture, upon soil deficient in azotised manure, produced 10 bushels more grain than an application of phosphate of magnesia and superphosphate of lime, which have no nitrogen. |
| Do. | Do. | 2. for Exhausted Land.<br>2 cwt. calcined bones, in hydrochloric acid,<br>2 cwt. ammoniacal salts,<br>¼ cwt. rape cake. | In an experiment with many mixtures (see Table 3, this compound produced the most effect. By substituting Liebig's Wheat manure for the dissolved bones, the effect was nearly equal Liebig's manure, without the rape cake and ammoniacal salts was, however, much inferior to it. |
| Do. | Do. | Muriatic or hydrochloric acid is better as a solvent of bones than sulphuric, both on account of a less quantity, in the proportion of three to four, having equal effect, and because the muriate of lime, one of the results of its action, being so much more soluble than the sulphate formed when sulphuric acid is used. | Mr. Lawes informs us that his practice teaches that, as a general rule, with grain and Grass crops, mineral matter is in excess, and cannot be taken up, because ammonia is deficient; and of any manures for such crops, that which yields ammonia at the lowest price should have preference. So far as a manure for grain, on ordinary or poor soils is concerned, this is a proper rule. |
| Wheat, Barley, or Oats. | Mr. J. Hannam, North Deighton, Wetherby, Yorkshire. | For Poor Soils.<br>¾ cwt. bones...£0 4 0<br>3 stones sulph. acid ..... 0 3 6<br>8 bushels soot 0 4 0<br>1 qr. rape-dust 0 18 0<br>1 cwt. nitrate of soda or sulphate of ammonia ..... 0 16 0<br>1 cwt. common salt ..... 0 2 0<br>For a winter sown crop, the two last ingredients to be applied in spring. The compost should be mixed with ashes. | Where Wheat or Oats are after pastured seeds, or Barley after Turnips consumed on the land, the nitrate of soda may be omitted. Potash, an important constituent of the cereal crops, is not contained in this manure, but may be added to a soil deficient in it. In ordinary cases, however, the ashes supply enough of it.<br>The soluble silicates which the cereal crops require are also absent; but excepting on peary soils, where any assistance towards the formation of a stiff straw is particularly valuable, these substances are unnecessary additions; ordinary soils contain enough of them naturally. |
| Oats. | Mr. Gardner, Agent to W. Fleming, Esq., Barrochan, Paisley, Renfrewshire. | 1 cwt. guano...£0 10 0<br>1 cwt. animal charcoal ..... 0 4 0<br>½ sulphuric acid 0 4 8<br>1 cwt. salt ..... 0 1 0<br>1 cwt. silicate of soda ..... 0 12 0<br>1 cwt. horn-dust 0 2 0<br>(E.) £1 13 8<br>2 cwt. animal charcoal ...£0 8 0<br>1 cwt. sulphuric acid ..... 0 9 4<br>½ cwt. muriate ammonia..... 0 7 6<br>¼ cwt. carbonate magnesia ... 0 1 3<br>½ cwt. sulphate magnesia ... 0 2 6<br>1½ cwt. salt..... 0 1 6<br>2 cwt. horn-dust 0 4 0<br>(F.) £1 14 1 | The great success of both these mixtures will be seen on reference to our *Table* 3; in Experiment VIII., on grain crops, each application produced an increase of nearly 3 quarters per acre. Of many mixtures, these answered best. See also Transactions of Highland and Agricultural Society of Scotland, for July, 1847, p. 34.<br>The animal charcoal is a very valuable constituent of these manures; it is charred bone-dust, containing all the mineral ingredients of ordinary bone-dust, and thus capable of benefiting by the addition of the acid; and charcoal, also in the condition most likely to be beneficial to the crop. |
| Barley. | Mr. Main, Whitehill, Lasswade, near Edinburgh. | ½ cwt. prepared night soil ..... } £0 12 9<br>½ sulph. soda } £0 12 9<br>½ cwt. saltpetre refuse } £0 12 9<br>1 cwt. animal charcoal ..... } £0 12 9 | This application answered well in Mr. Main's experiments (see *Table* 3.) An addition of sulphate of magnesia to the night-soil is especially useful for Barley. |
| Oats (upon moss). | Mr. Fleming Barrochan, Renfrewshire. | 1 cwt. bones dissolved in muriatic acid £0 9 4<br>1 cwt. sulphate of soda..... 0 9 4<br>1 cwt. silicate of potash ..... 0 16 0<br>¼ cwt. sulphate ammonia..... 0 10 8<br>£2 5 4 | The experiment (see *Table* 3) with this mixture upon moss has been noticed by many writers. It is recorded in Professor Johnston's Lectures, Appendix, p. 68. The mixture was remarkable for its effect upon the quantity and *quality* of the grain and straw. |
| Clover. | Mr. Huxtable, Sutton Waldron, Shaftesbury, Wiltshire. | 1 ton of strawless cow-dung dissolved in water, and poured over 30 bushels coal ashes, dried with 2 or 3 cwt. gypsum | Mr. Huxtable recommends this mixture, because the cow-dung is rich in the salts of potash, which Clover requires, and the coal ashes contain gypsum. If it can be afforded, 2 cwt. of super-phosphate of lime, he states, would improve the mixture. |
| Do. | Mr. Lawes, Rothamsted, St. Alban's, Hertfordshire. | 2 parts superphosphate of lime<br>1 sulphate of ammonia, or<br>1 muriate of ammonia. | This mixture, Mr. Lawes states, he has used with great success on his own farm. [In this manure, however, the necessary fixed alkalies are wanting.—L. P.] |
| Sown Grasses for Hay. | Mr. Gardner, Agent to W. Fleming, Esq., Barrochan, Renfrewshire. | 1 cwt. animal charcoal ....£0 4 0<br>½ cwt. sulphuric acid ..... 0 4 8<br>1½ cwt. horn-dust ..... 0 3 0<br>½ cwt. carbonate magnesia 0 0 7½<br>½ cwt. sulphate of soda..... 0 1 3<br>½ cwt. salt ..... 0 0 6<br>½ cwt. sulphate of ammonia . 0 4 0<br>½ cwt. potash... 0 6 0<br>½ cwt. carbonate of soda ... 0 2 0<br>£1 6 0½ | This application increased the produce nearly threefold (*Table* 3), and was tried against seventeen other applications.—(See *Trans. High. Ag. Soc.*, March, 1847.)<br>[The quantity of phosphates in this manure would not be sufficient for many kinds of crops. The quantity of lime present is scarcely sufficient for the grasses. Gypsum might be added advantageously.—L. P.] |
| Peas. | Mr. Huxtable, Sutton Waldron, Shaftesbury, Wiltshire. | 2 cwt. superphosphate of lime.<br>10 bushels lime,<br>5 bushels salt,<br>blended with ashes. | The injurious tendency of recent dung upon this crop is well known. "My own trials and others," Mr. Huxtable says, "prove how saline dressings increase the podding of the plant." |

LIST OF ARTIFICIAL MANURES—*continued.*

| Crop to which the Manure is applied. | Name of Author. | Composition and Cost of the Manure, per acre. | Remarks. |
|---|---|---|---|
| Hops. | Mr. Nesbitt, Kennington-lane, Lambeth. | 3 cwt. guano . £1 4 0<br>1 cwt. common salt ..... 0 1 0<br>½ cwt. saltpetre, or 1½ cwt. silicate of potash... } 1 19 9<br>½ cwt. of gypsum ..... 0 0 9<br>£3 5 6 | This mixture Mr Nesbitt proposes on trial. There can be little doubt, as it contains nitrogen in abundance, that it will be successful Woollen rags, the manure *par excellence* for hops, excels in nitrogen. We should mix with ashes. |
| Flax. | Prof. Johnston, of Durham. | 25 lbs. bone-dust, or bones dissolved in sulphuric acid.<br>10 lbs. gypsum.<br>20 lbs. pearl ashes.<br>20 lbs. soda ashes.<br>25 lbs. slaked magnesian lime, or<br>20 lbs. sulph. magnesia and 5 lbs. quicklime, mixed and substituted for last ingredient. | This manure, we do not hesitate to say, for practical reasons mentioned in the sequel, has its several ingredients much too small, even if we consider only the mineral constituents of the crop. It is also totally inadequate to afford the requisite organic food the crop requires. It is very rare to find alkaline carbonates in plants—although they are produced during their incineration. In all cases they should be used with caution. |

## PART II.—SUGGESTED ARTIFICIAL MANURES FOR GENERAL PURPOSES.

| Name of Manure. | Author. | Composition, per cwt. | Remarks. |
|---|---|---|---|
| Artificial Guano. | Prof. Johnston, of Durham. | 66 lbs. of bone dust,<br>23 lbs. sulphate ammonia<br>1¼ lbs. pearl ashes,<br>20 lbs. common salt,<br>3¼ lbs. sulphate soda.<br>Cost about 9*s*. | For cases in which this has been employed, see *Table* 3.<br>From 3 to 4 cwt. per acre of this mixture should be used. |
| Barrochan Guano. | Mr. Fleming Barrochan, Paisley, Renfrewshire. | 18 lbs. of bones dissolved in sulphuric acid,<br>18 lbs. of charcoal powder,<br>10 lbs. sulph. ammonia,<br>10 lbs. of common salt,<br>10 lbs. of gypsum,<br>41 lbs. of wood-ashes,<br>3 lb . of nitrate soda,<br>1 lb. of sulphate soda,<br>1 lb. of sulph. magnesia.<br>Cost about 10*s*. | This has frequently been used with success. See *Tables* 3 and 4.<br>Not less than 5 cwt. per acre of this composition should be employed. |

## PART III.—SUGGESTED ARTIFICIAL MANURES, FOR USE AS AUXILIARIES TO FARM MANURE.

| Name of Author. | Use of Mixture—Special or General. | Composition of the Manure, per acre. | Remarks. |
|---|---|---|---|
| Mr. Gardner, Agent to W. Fleming, Esq., Barrochan, Paisley. | Special—for Turnips & GreenCrop. | 3 cwt. Peruvian guano..... £1 10 0<br>2 cwt. animal charcoal ..... 0 8 0<br>1 cwt. sulphuric acid ..... 0 9 4<br>1 cwt. carbonate magnesia ... 0 5 0<br>1 cwt. sulph. of soda ..... 0 5 0<br>1 cwt. muriate ammonia..... 0 15 0<br>1 cwt. common salt ..... 0 1 0<br>3 cwt. horn-dust 0 4 0<br>½ cwt. carbonate potash ..... 0 6 6<br>£4 3 10 | See *Table* 4. Upon Turnips this mixture gave an increase of 12 tons over 15 tons of extra dung. It increased the crop of Potatoes also 50 per cent. [The error in this compound manure is the small quantity of potash, which is the main constituent of Turnips. A small quantity is indeed contained in the guano as well, but this is not sufficient.—L. P.] |
| Mr. Dalton, York. | General Purposes. | 1 cwt. sulphate ammonia..... £0 16 0<br>80 lbs. nitrate of soda ..... 0 15 0<br>4 cwt. gypsum... 0 4 0<br>(A.) £1 15 0 | In our trials, see *Table* 4, both this and the subjoined mixture was useful as an auxiliary. It is adapted for a spring dressing for grain crops. [This cannot properly be called a manure, as it is deficient in many necessary ingredients.—L. P.] |
| Do. | General Purposes. | 40 lbs. nitrate of soda..... £0 7 0<br>60 lbs. sulphate ammonia ..... 0 8 6<br>4 cwt. gypsum... 0 4 0<br>Animal oil..... 0 5 0<br>(B.) £1 4 6 | With the addition of 2 cwt. of superphosphate, this might be in reality what it is called "a bone substitute." As it is, it can only be depended on as an auxiliary. |
| Mr. John Hannam. | Special—for Turnips & GreenCrop. | ½ cwt. of ½-inch bones ..... 0 2 8<br>dissolved in<br>¼ cwt. of sul. acid 0 2 4<br>and mixed with<br>½ cwt. fine bone-dust..... 0 2 8<br>1 cwt. of guano 0 10 0<br>1 cwt. of salt ... 0 2 6<br>2 cwt. of gypsum 0 2 0<br>(A.) £1 2 2 | This mixture is equally well adapted for use as a substitute for farm-yard manure. In such cases, on very poor soils, the quantity of bones may be doubled.<br>During the present season, 1848, it has produced most striking results on the Turnip crop. Our mode of pre- |
| Mr. J. Hannam, North Deighton Wetherby, Yorkshire. | Special—for Turnips & GreenCrop. | Enough ashes to be added, after the mixture has been made about three months, to form a compost for drilling.<br>1½ cwt. of bones, and 1 qr. of ashes, and soil saturated with liquid manure from the tank 0 8 0<br>1 cwt. of guano 0 10 0<br>1 cwt. of salt ... 0 2 6<br>2 cwt. of gypsum 0 2 0<br>(B.) £1 2 6 | paration is to mix the acid and rough bones together in the manner that masons make up mortar—the walls of the basin being made of the fine bone-dust. In this state they are left for several days; after which, the fine dust is mixed with the dissolved bones and thrown into a heap, upon which the other ingredients are spread in alternate layers. In a month the heap should be opened and the whole of the substances thoroughly mingled, after which the heap may be slightly covered with earth and remain till spring, when it will be fit for use. The manure should be made in quantities sufficient for several acres at one time.<br>Mixture B should be made into a heap and allowed to lie for three or four months before it is used. When used without farm manure upon poor soils it may be applied in a larger quantity than that specified. |
| Do. | Potatoes. | 1 qr. of rape-dust..... 0 18 0<br>2 cwt. of guano 1 0 0<br>1 cwt. sulphate soda ..... 0 6 0<br>1 cwt. common salt ..... 0 2 0<br>£2 6 0<br>For mixture with 10 or 12 cubic yards ordinarily good farm manure. | When no farm-yard manure can be had, this mixture will act as a substitute. In such cases double the above quantity of compound must be applied. The quantity specified here is about the proper quantity to use as an auxiliary to 10 or 12 cubic yards of farm-yard manure. We have witnessed the good effects of this mixture on many occasions. |

## Home Correspondence.

*Experience in Land Draining.*—The powerful expansive pressure that soils, particularly clays, exercise on hollow bodies, to crush or to fill them up, has to be seriously considered in the selecting of forms for pipes or tiles to be used in draining. I have lately had to take up a long length of drain that has been laid only six or seven years, formed of half-circle 6-inch tiles, placed together, so as to form a cylinder; and notwithstanding these tiles are ⅔ of an inch thick, they were found for many yards together split along the back, and driven into the drain. The soil is the Wealden clay. In this and other situations, I also have found 3-inch pipes having for their transverse section a circle with a very narrow opening at bottom, resting on feet, perfectly plugged up. The clay having evidently been pressed in, until it had become as hard inside as the exterior; and in like manner I have seen drains made with slabs of chalk, choked up, and useless, in a few years. This plugging up of the drains, I have little doubt, is done by the pressure of the soil, partly by its weight, and partly by its alternate expansion and contraction, under the alternate influence of wet and drought. The soil round the pipe becoming charged in the winter season with water, expanded and pressed into the pipe; and on the water leaving it, shrinking back, and so much of the soil as had been pressed in, and would not return, would be left behind; and in this way, the drain, by additions, year after year, gradually fills, and eventually, from the external pressure, is plugged up. I was once present at the examination of a leaden coffin that had been dug up, after having been buried many ages. It was squeezed out of all form; and on opening was found to be full of earth, which, I have no doubt, had been gradually worked into it, by the expansive force alluded to; and so great had this been, that the bones of the skeleton had indented their form into the bottom of the coffin. I am pleased to find that this force of soils has not escaped the notice of the clever writer of the Essay in the "Quarterly Review," No. CLXXI., and which has since been published in a separate form ("Agricultural Drainage," John Murray); for it shows me the very close and practical attention he has given to the subject, and I quote, with pleasure, his words:—"We shall shock and surprise many of our readers, when we state confidently that in average soils, and still more particularly in those which are inclined to be tender, horse-shoe tiles form the weakest and most failing conduit which has ever been used for a deep drain. Tiles of this sort were used in 1760, at Grandesbury Hall, in Suffolk, constant failures resulted from their use, and many of the tiles were found to be choked up with clay, and many to be broken longitudinally through the crown. For the first evil, two remedies were adopted; a sole of slate or wood, or of its own material, was sometimes placed under the tile, but the more usual practice was to form them with club feet. To meet the case of longitudinal fracture, the tiles were reduced in size, and very much thickened, in proportion to their area. The first of these remedies was founded on an entirely mistaken, and the second on no conception at all, of the cause of the evil to which they were respectively applied. The idea was that this tile, standing on narrow feet, and pressed by the weight of the re-filled soil, sunk into the floor of the drain; whereas, in fact the floor of the drain rose into the tile. Any one at all conversant with collieries is aware, that when a straight work is driven in coal, which is a small subterranean tunnel 6 feet high, and 4 feet wide, the rising of the floor is a more usual and far more inconvenient occurrence than the falling of the roof; the weight of the two sides squeezes up the floor." *Hewitt Davis, 3, Frederick's-place, Old Jewry, April* 4.

*The Present State of Irish Agriculture.*—In following up my remarks on the practical instruction of the adult population, as promulgated by Lord Clarendon, I am not prepared to say how far such a scheme has proved successful. I cannot believe so sanguinely of the extensive benefits conferred as others do. 1. Because I reside in one of the most wretched localities of Ireland, where agriculture is very backward, and where practical instructors have been successively appointed, the efficacy of whose labours appears to me, and many others, very questionable indeed. I know of no instance of individual improvement effected through their agency. 2. The extensive districts allotted to each instructor, in some cases exceeding a circuit of 20 miles, must render his efforts exceedingly superficial. 3. As practical instructors are not permanently employed, it is not unreasonable to ask, what amount of interest they have at stake in the success of their duties? Of course it is hoped every instructor is interested. How far is it to be expected that a practical instructor, a stranger, visiting a small farmer deficient in capital, industry, and without the means of providing the morrow's support, can produce a healthful, a permanent change in his affairs, who knows, and apparently desires to know no more than the mere growth of the Potato crop? What magic influence does such an instructor's words possess? What the power of his persuasive eloquence, that could in a casual visit soften the prejudices of years, the rigidity of confirmed ignorance, and well nursed antipathies against all innovation upon established rights? He may tell a farmer what to do; but how to do it, how to accomplish an end when the means are absent is a serious proposition. That class of farmers, in the last agonising struggles to support a shattered frame, in the tillage of a worn-out soil, with an empty pocket, a pauperised mind, and the dreadful prospective of a gloomy workhouse, and an early grave, cannot attend to the lessons of an instructor. Let the instructor visit a "strong farmer," and he will find it difficult to convince him, who is so dilatory to be reformed by improved practice. Uneducated Irishmen are of strong prejudices, fixed habits, and of indomitable attachment to their own ways of thinking and acting; they have a peculiar reluctance to change any long-practised custom for any reason; and is it natural if the small farmer, the struggler between complex hopes and impending ruin, views with distrust the dictates of a stranger—the precepts that come unrecommended by example? Hence, I say, this mode of instruction is uncertain. Estate agriculturists approximate more to the real wants of practically educating the adult population, than that set on foot by my Lord Clarendon. These agriculturists, when under a sensible proprietor, can accomplish infinite good, supported by a proprietor who will act upon reasonable suggestions; the agriculturist can forward the interests of an improving tenant, and check the negligence of an indifferent one. It would be well in every case to grant the agriculturist a patch of land for a model farm, to practically explain what he teaches. Attention to these matters formed the road to that successful career of local and general good which characterised the late Mr. Blacker, of Armagh. Landlords are not to console themselves with the idea that having employed the services of an agriculturist, they have done their duty to their tenantry. They have but performed an important step towards a great improvement, which to be accomplished must be supported by subsequent legitimate means on their part, continued. Agricultural publications, like other means of improving Irish farming, are few and feeble. The press is a powerful engine, when properly directed, for the moral, social, and industrial instruction of the people. But in Ireland I may safely say we have no such means. We depend upon the English press for developing agricultural im-

provement; we look up to it for superior agricultural intelligence; the confirmed rules of practised experiment, and the successful investigations of science-directed skill. What periodicals have we in Ireland; or what do they record? Glance at their meagre sheets, and read the wretchedness of Irish cultivation. We seek in vain in their columns for original writings, the results of well-planned experiment and sound experience. It is true we find columns of multiplied quotations from magazines, journals, and pamphlets, all very good in their nature, but lamentably indicative of the want of that support which gives dignity to a publication, and makes it useful and interesting. *Libra, March* 31.

*The Tullian System.*—It is very natural that "Amicus Tull," and others who feel interested in the Tullian system, should desire the fullest information on the expenditure it involves. Having applied the system to Wheat growing, both on very stiff clay and on light lands on the chalk, I can give an account of the actual cost incurred in the primary operations. In October last, I applied a six-acre field of very stiff clay to this purpose. It not having been previously drained, I had it drained throughout, at 3 feet deep. The field was ploughed, and then marked out, and sown at the rate of two pecks per acre—strictly as directed by Mr. Smith, in the "Word in Season." As soon as the Wheat was above ground, the intervals were dug—not with the spade, but with the graft, used in draining—about one foot deep. This was done by contract, at 2*s.* 3*d.* per score of running rods, and cost 14*l.* 1*s.* 9*d.* The men being strange at the work, and the clay so stiff as to make it desirable to have buckets of water by their side to dip their tools in, would not undertake the work at a less price. Hereafter I shall be able, I believe, to get it done at 2*s.* per score. "Amicus Tull" seems to suppose that this digging is only two-fifths of the acre, but it is fully one-half. The Wheat, just above ground, could be approached on either side within 3 inches, and therefore 2 feet 6 inches wide were dug. As this digging cost, for the half of the six acres, 14*l.* 1*s.* 9*d.*, it follows that were the whole dug, the cost per acre would be 4*l.* 14*s.* Mr. Smith reckons the cost, for the first year, 4*l* per acre. Considering that the wages paid in Northamptonshire are 9*s.*, whilst in this part of Surrey they are 12*s.* per week, I find my expenses tally very well with Mr. Smith's estimate. The men earned 2*s.* per day at the digging. And I may here remark that, by this spade labour, 6 inches of subsoil below the plough had never disturbed, were brought to the surface. The Wheat is luxuriant, and the intervals singularly clean. Now, on the light land, in a different part of my estate, about a mile and a half from the field I have mentioned, the whole was dug one spit deep, after taking off a good crop of Potatoes. For this digging 2½*d.* per rod was paid. In November, when the Wheat had come up, we trenched the intervals. For this trenching we paid 6*d.* per rod, which is equal to 4*l.* per acre. On this light land we have run Dr. Newington's Cultivator through the intervals, prior to the late rainy weather. Nothing can look better than this Wheat—of a fine dark colour—close to the ground, and tillering well, it gives promise of a good return. Although so thinly sown (2 pecks per acre), every one remarks that it is now "much too thick." I shall be happy to show these fields to any one taking a real interest in the question, and who may feel inclined to try the system. I can answer for the thorough truthfulness of the statements my excellent friend, the author of the "Word in Season" has put before the public. He is too experienced a judge to be easily misled, and far too upright intentionally to mislead others. I believe the whole subject to be deeply deserving of the attention of agriculturists and landed proprietors, as one means of alleviating the pressure of the times, and our best thanks are certainly due to Mr. Smith, for his earnest and patriotic pursuit of this enquiry. *James Gadesden, Ewell Castle, Surrey.*

*Poultry.*—About six weeks ago one of my hens became ill, and lost the use of one of its legs. I was told over-laying was the cause of the malady, and was recommended to give her a few peppercorns, and a little bread soaked in ale, which was forced down her throat. In a few hours the bird was walking about the yard; however, in a couple of days she had a relapse, when the same dose was administered, and she was separated from her companions for 48 hours, when she quite recovered, and has had no return of her complaint, and produces her fair number of eggs per week. This may be a useful hint to amateurs, as I was informed by a poultry fancier of some experience that my hen would die. *Falcon.*

*Tullian Agriculture.*—It is cheering to perceive that minute tillage, or the Tullian system, is coming into practice. The value of frequently moving the soil between growing crops has been most satisfactorily proved, both as a means of increasing the produce and destroying weeds. However beneficial it may be to stir the earth at intervals, in order to make it more productive, yet it appears rather a dangerous plan to advocate the use of the fork and hoe as substitutes for manure. Under such management, in all probability, after a time, the land would become exhausted, and require a number of years to regain its fertility for general purposes. A good dressing every third year, assisted by a liberal allowance of manual labour, will keep most descriptions of land in bearing condition, provided suitable manure is applied. The great enemies to cultivation are a superabundance of moisture, Nettles, Thistles, Docks, Charlock, Dandelions, Buttercups, &c., which are too often permitted to flourish in luxuriance, and dug in, under the idea of keeping the soil cool during the summer. Having plundered the soil of a vast amount of nourishment, many of them again spring up to torment the farmer, and reduce his profits. Weeds ought to be considered of some use, from the multitudes that are permitted to show themselves amongst growing crops. The late mild winter will tell a tale, this year, on imperfectly cleaned land, which, as the warm weather advances, will be covered with vegetable and insect intruders. Where Potatoes were planted last year on clay soil, it has been found impracticable to either fork or dig in manure for spring sowing, instead of which the land has been breast-ploughed about four inches deep, so as to bury the muck, and promises, when the weather holds up, to be in famous order for the land-drill. It is difficult to lay down precise rules for cultivation to meet the wants of agriculturists. What answers one season fails another. A man must be guided very much by the material he has to work upon. In stiff soil, deep trenching once in three or four years is found sufficient, and better than doing it every season. After this operation, about four inches of the soil should be kept moved, so that the air may penetrate and prevent the earth massing and becoming hard. Annually turning over clayey soil 12 inches does not give it time to become separated, before it is again excluded from the influence of the atmosphere, and reduced to a damp consistency, resembling dough. After the deep digging, if from four to six inches are made intimately acquainted with the agricultural tools, and well incorporated with lime siftings from an old wall, road dirt, soot, and ashes, well saturated with liquid from the yard tank, it will become fitted in due course to be returned to its original position, without any fear of its again running together. The lower six inches may be treated in the same manner, thus affording in about eight years a description of soil that will be most valuable, and capable of being tilled with comparatively little trouble, having lost in a great degree its tenacity during the process. Draining is, of course, indispensable. Perhaps some of your more experienced correspondents will favour your readers with their opinions on this subject, in reference to stiff clayey soils. Light land may be worked deeply with advantage, but manure should seldom be covered with more than four inches of earth, to guard against the rain washing it below the reach of the roots, in a filtering description of land. The writer has no wish to speak positively as a rule for others to direct their course; although his manner of writing may be somewhat concise, he is only too glad to obtain hints from all quarters, and has gained much information from labourers, who often state facts without being able in any way to account for them, which, when analysed, are of much value. We may learn something every day if we keep our eyes and ears open. Well-made farm manure cannot be dispensed with. *Falcon.*

*Deep Draining.*—It is some time since I have read anything more practically useful than the communication from Mr. Paine in the last *Agricultural Gazette*, and it so far falls in with the opinion I have long entertained, that I am induced to trouble you with a few observations. This gentleman has, I think, to use a common expression, "hit the right nail on the head," in pointing out, and indeed proving the importance of draining at narrow intervals. There had been a great deal of discussion on the depth of draining, which, without undervaluing it, is, in my opinion, of no greater importance, than the proper intervals between the drains. What a difference there is in the dryness of the land, in the immediate vicinity of a drain, and that at some distance from it, particularly in the spring! The situation of the drains on my own land (the London clay), can now be distinguished at a considerable distance, by the lighter colour of the land, for the space of several feet on each side of the drain. Now, why should this be the case? If the water can escape so fast as is desirable from the land, midway between the drains, this portion of the ground ought to be dry first, and that near the drains last, seeing that the latter has not only its own superfluous water to get rid of, but that which it receives from the adjoining land, in its passage to the drain. No doubt the field alluded to by Mr. Paine is a specimen of perfect draining, assisted as it is by subsoiling; but then the expence, which seems enormous. Mr. Paine says that it has paid in his case; I doubt much that it would on some of our thin soils, on the London clay; and until such perfect draining can be profitably practised, the surface water furrows, and eight feet ridges, as recommended by Mr. Mechi, are, I think, desirable. I should be very sorry to dispense with them in my own case, and indeed I have seen much mischief occasioned by making the attempt. It is not one or two days' rain, that injures retentive land, but a succession of wet weather, for a week or a fortnight together. When the land is thus saturated, who is there that would not if he could dispense with a continuance of rain, until the drains had got rid of much of that which has fallen; but as we cannot do this, the next best thing to be done, is, in my opinion, to let it run off the surface as fast as it can. *W. C. Spooner.*

## Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Weekly Council was held at the Society's house in Hanover-square, on Wednesday last, the 9th of April. Present, The Earl of Ducie, Vice-President, in the chair, Lord Bridport, Sir Robert Price, Bart, M.P., Sir John V. B. Johnstone, Bart, M.P., Don Domingo Savignon, Mr. Hodgson Barrow, M.P., Mr. Bosanquet, Mr. Burke, Mr. T. T. Clarke, Mr. Capel Cure, Mr. Dyer, Mr. Gadesden, Colonel Hall, M.P., Mr. R. Jennings, Mr. Maddison, Mr. Marshall, M.P., Mr. C. E. Overman, Mr. Parkins, Mr. Rowlandson, Mr. Sanford, Mr. Serjeantson, Prof. Sewell, Mr. H. A. Smith, Mr. Robert Smith, Mr. S. R. Solly, Mr. C. Hampden Turner, Prof. Way, and Mr. George Wilbraham.

The following members were elected:

Francklin, John (High Sheriff, Notts.), Gonalston, Notts.
Wilbraham, Hugh, Westport, Co. Mayo, Ireland.
Cartwright, William S., Stow House, Newport, Monmouth.
Brooks, Samuel, The Bank, Manchester.
Walker, George Richard, Heathfield House, Oxford.
Caines, James, Cheselborne, Blandford, Dorset.
Esdaile, Wm. C. Drake, 10, Gloucester-square, London.
Locke, Wadham, Stourcliffe, Christchurch, Hants.
Montgomerie, Fred. Molyneux, Garboldisham, Norfolk.
Nurcombe, John, Hopcott, Minehead, Somerset.
Tottenham, Rev. Rt. Loftus, Vicardale, Carrickmacross, Ir.

The names of three candidates for election at the next meeting were then read.

Communications were received by the Council from Viscount Palmerston (through Mr. Addington), transmitting a copy of a work from Vienna, "containing an account of an insect called the Gollubatz-fly, which has been very destructive to cattle on the Lower Danube." From Chev. Claussen, copies of a pamphlet published by him on the Flax question, and an expression of his thanks for the kindness with which the Council had received him at two of their weekly meetings. From Mr. Wheble, of Bullmershe-court, near Reading, reporting favourably of Mr. Donlan's machinery, which he had inspected, for the preliminary operations of the farmer on the Flax grown by him, and rendering it at once, in his opinion, adapted for M. Claussen's purposes, without much trouble or expense: Mr. Wheble also transmitted specimens of Flax prepared in his presence by Mr. Donlan, in the course of five minutes; and, he expressed his opinion, that with this mechanical facility offered to them, many farmers would grow Flax, which he thought neither an expensive nor an exhausting crop. From Mr. Bethell, of 8, Parliament-street, samples of fibre from Rye-grass, which the spinners at Manchester stated they could easily work into fine cloths. From Sig. Londriani, of Milan, offering to instruct the dairy-farmers of England in the method of making, from skimmed milk, a cheese equal to the "Parmesan" cheese of Lombardy, possessing the same qualities for keeping which rendered that cheese so well adapted for provision purposes in the navy. From Mr. M. C. Salvin, a copy of a Farming Essay on the Management of Clay-land under green crop. From Mr. C. Whytell, results of his experience in the use of manures, and the destruction of wire-worm.

The Council having ordered their thanks for the favour of these communications, interesting discussions ensued among the members present, on the destruction of the wire-worm, and on the action of charcoal in depurating fecal matter.—Colonel Hall, M.P., reported the great advantage he had derived from a drill-roller, or presser, supplied to him by Messrs. Barrett and Co., of Reading. It was particularly adapted for light lands, and was well known and estimated in the East Riding of Yorkshire. It was drawn by four horses; the pressers were about three or four inches apart, and they cut about half an inch deep into the soil. When the Turnips were about six inches out of the ground, he passed this roller over them; and in every case of his own trial, or that of others he had heard of, the wireworm was entirely destroyed. On Coleseed or Barley it had the same effect. He considered that it consolidated the land more than Crosskill's clod-crusher.—Sir John Johnstone called the attention of Professor Way to the action of charcoal as a deodoriser and secerner of manuring matter.—Professor Way related some interesting researches in which he had been engaged on this subject. He had found that although charcoal in fine powder, when used as a filter, would intercept all manuring matter held in mechanical suspension, and would transmit the water through it perfectly clear and colourless, it had not the power to arrest the valuable element ammonia, which passed through along with the water; also that the manuring matter which it did arrest was only brought by the charcoal into a condition to become more rapidly decomposed, and to escape in the gaseous form into the atmosphere, so that the charcoal so employed was of comparatively very little increased value as a manuring substance, than simple charcoal which had not been employed as the bed of the filter. Professor Way then proceeded to answer the various enquiries made of him on points connected with this important subject, and received the thanks of the Council for the interesting details he had given them. Sir Robert Price, Sir John Johnstone, Mr. Marshall, Mr. Robert Smith, Mr. Rowlandson, Mr. Sanford, and other members present, also furnished interesting practical details on this subject. The Council then adjourned to the following Wednesday.

## Reviews.

*The American Poulterer's Companion: a Practical Treatise, with illustrations and portraits of Fowls taken from life.* By C. N. Bement. Fifth edition. New York, 1850. Pp. 379.

On first hearing of the existence of this publication, we were anxious to procure it, to ascertain whether it were an original work, founded on observations in the New World, or a rehashed farrago of the European poultry books. "The author of the work is the popular landlord of the American Hotel, Albany. From long experience as a public caterer, Mr. Bement is fully qualified to judge of the qualities of poultry; and from his earliest youth, he says, he has taken great interest in

rearing it as a matter of profitable investment. The subject is one which comes home to the bosoms and stomachs of every one, particularly about Thanksgiving time." It is now about five years since the first edition of this work was published. Four editions have been taken off. We hoped for something fresh and good; but, on opening the book, down came disappointment, like a drizzling rain, and the cloud was not quite dispersed by the sundry curiosities that are to be found within its pages. American literature may be believed to be as yet merely embryotic; the New World Poultry-book is at present unwritten.

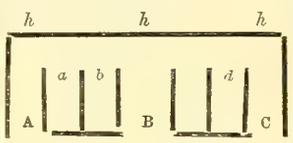
The cuts are numerous; few are novel, none are artistical. The frontispiece is the Royal poultry-house at Windsor. This we had all seen well drawn in "Farming for Ladies," ill drawn in Mr. Nolan's book; still it might be welcome to the American reader: but further on, we have Mr. England's poultry-house at pp. 90-1; the bantam's nesting places, p. 99; the poultry-feeding fountain, p. 117; the domestic turkey, p. 219; Reaumur's hatching apparatus, p. 324; Reaumur's artificial mother, p. 337; and the progress of the egg during incubation, at p. 313; all which had been engraved on the wood on this side of the Atlantic, long before they were traced by the pencil of any artist in the United States. That ever-standing dish, Lord Penrhyn's poultry-house, is once more served up again. The narrative cannot move without long quotations from Moubray, Boswell, Cobbett, Main, Walter B. Dickson, Parmentier, Reaumur, and Olivier de Serres. We hoped that America had brought forth from her vast storehouse some relishing and substantial viand; we fall to with appetite, but alas!

—"the funeral baked meats
Do coldly furnish forth the marriage tables."

We should not take the trouble of sending to New York for the information that "in December, 1793, the number of turkeys sent to London, by the stage coaches from Norwich alone, amounted to upwards of 2500, weighing nearly 14 tons." (p. 15.) From America, however, we do look for something good about the turkey, and the preface to the fifth edition announces that "A few hints on the subject of rearing turkeys, furnished by a friend, on page 239, will no doubt be found very useful to the breeders of that valuable domestic fowl." We turn to the place, and find from Col. Wade Hampton, of South Carolina, as follows:

"On the subject of rearing turkeys, I venture to make you a suggestion or two. As soon as they are removed from the nest, immerse them in a strong decoction of tobacco, taking care to prevent the fluid from entering the mouth or eye of the chick, and repeat the operation whenever they appear to droop. Corn bread soaked in pepper tea, is the best diet for them, after they are two or three days old, that I have ever tried. They are particularly liable to chills, which nothing so effectually cures as the pepper. A table spoonful of cayenne pepper to a quart of boiling water is about the rate at which it is used."

We refrain from any comment on the tobacco bath. Should any poulterer see fit to try it this season, perhaps he will be so obliging as to communicate the result. But more really valuable hints than this are given respecting the turkey in America. Mr. Bement quotes Mr. Peter Boswell's statement that when first discovered in America, it was seen both in a wild and a domestic state. Neither writer gives his authority, and we have not time to hunt for it, but might probably find it either in Buffon or in Dr. Latham; but there is a curious statement in Gosse's "Birds of Jamaica," to the same effect, *i. e.*, that this bird was already found in a domestic state by the Spaniards among the natives of Hispaniola! This unexpected fact would throw back the domestication of the turkey to quite an indefinitely remote era. And there seems to be almost the same ill-luck and difficulty attending the endeavour to obtain a tame race of turkeys from the wild birds of America, that there is in rearing farm-yard ducks and drakes from the British Mallard, or *Anas boschas*. Mr. Bement quotes a letter from the 10th vol. of "The Cultivator."



"Ever since General Lafayette was in this country, and expressed a wish to obtain some wild turkeys to take with him to France, I have felt an interest in this kind of poultry. When I came to this state (Illinois) in 1835, I made up my mind that I would endeavour to obtain and domesticate some of them as soon as I could. Upon inquiry, I learned that occasionally a nest of eggs was found and put under hens to be hatched out, and the young ones killed in the following winter, under an apprehension that they would run off in the spring. In 1837, a nest of 8 eggs was found, which I purchased. These I set under a hen, and all were hatched out. A difficulty now occurred—the young turkeys paid no attention to the hen's cluck, were disposed to wander about, and make the hen follow them, instead of their following the hen. In this way some of them were lost, in consequence of going further from the house than the hen was disposed to follow. Of the eight I succeeded in raising but one; though I believe some of them died a natural death. This one kept company with the hens, and roosted with them, till, by repeated alarms from vermin, he forsook the hen-house, and took the roof of a stable for a roosting-place. This proved to be a cock but it was not till he was more than 18 months old that he began to strut and gobble [*i. e.*, he was three times as long in attaining the adult state as birds of the domestic race. The discrepancy is very remarkable. Elsewhere (p. 213) Mr. Bement informs us that, "the wild turkeys are described as being much larger than the tame ones. Far from being improved by care and abundance of food, contrary to most other wild animals, this species has degenerated. Wild turkeys, it is said, often weigh from 40 to 60 lbs." Can there possibly be an original specific distinction between the two races?] In a very windy time he would leave his roosting-place, and go into the hazel bushes which were near by, to lodge. On one of these occasions he was killed, probably by a prairie wolf, as there were plenty in the neighbourhood. This turkey was so thoroughly domesticated that he would eat corn out of my hand, and showed no more disposition to wander off than my hens." (P. 215.) Another equally disappointing attempt follows. Mr. Bement gives similar ones from his own observations amongst his acquaintance.

"A family in a small grove, had a pair of wild turkeys; the hen, when a year old, laid a nest of eggs, but none of them hatched; a season after this, she raised a litter of young ones, which, after getting their growth, with the old ones in company, left the grove, and never returned. [Exactly as our wild ducks would do.] Another family had a pair; the hen got accidentally killed when about a year old, and the male kept company and roosted with the fowls. The next spring the owner procured two tame hen turkeys, and succeeded in raising 28 half-bloods. A neighbour had a wild male domesticated, one year old, and two tame hen turkeys. That season not one egg hatched; the next season, from one of the hens, the other having died, he raised 14 or 15 half-bloods. The cocks (unlike the tame in that respect), it seems, do not come to maturity till they are two years old. The half-blooded turkeys bear a greater resemblance to the wild than they do to the tame, and will breed equally well." This informant sums up, "Although my attempts at rearing wild turkeys have been so unsuccessful, I am not discouraged, but intend to persevere in the effort a while longer; I believe it will be some little object to raise the full and half-bloods here, but much more of an object in your neighbourhood, for the city market. The reason why they would have a preference over the tame turkey is: 1st. That they are larger; one was killed about 10 miles from me which weighed 24 lbs.; and I have heard of their being killed in Ohio, one at least, which weighed rising of 30 lbs. 2dly. They are more robust, will bear the rain and wet Grass, and therefore more easily raised than the common turkey. 3dly. They are hunters of flies, bugs, and other insects; and eat much less corn or meal than other poultry, and are of course more profitable. They are a more profitable fowl than the tame turkey; their colour is brown or snuff, with feathers having a lustre or brilliancy upon them in some degree like the peacock."

These are the sort of particulars that make an American poultry-book interesting to Europeans, and which are requisite to give it a permanent value even in its own country. So few travellers are competent to make trusty observations on the *domesticated* animals of foreign lands, that any technically correct account of them is eagerly perused, for the sake of the information to be gained from it. Botanists and nurserymen *send* educated discoverers to traverse the face of the earth, and pounce upon any novelty the moment it is detected by their sharp glances. Natural history, as far as wild creatures are concerned, has agents stationed in every province, who secure for anxious and liberal employers at home every suspected addition to the world's Fauna—living or dead, in the skin, in the feather, or in the flesh; but with 99 tourists out of 100, a cow is a cow, a sheep is a sheep, and a hen is a hen. Unknown breeds of cattle and of poultry might pass unobserved, and remain unimported. Domestic races are too often not made a study by those who ought to study them, till the opportunity of observing them abroad is lost for ever. We would give anything in reason now to see what we might once have seen of domestic birds and beasts, in our range between John O'Groat's house and the south of Italy.

The Midland Counties will be pleased to hear from Mr. Bement, that one of their favourites, "the Bolton Greys, or Creole Fowl," maintain, under the very different climate of America, exactly the same character as they do at home." Dr. Rufus Kettridge, of Portsmouth, N. E., who seems quite a connoisseur in the poultry business, says, in a letter to the author, "the first account I ever saw of the Creole fowl (which led me to procure them), was in the "New England Farmer," vol. xviii., Nos. 39 and 43. The Creole is a small fowl, about the size of our common hen; the greatest layers I ever saw. I received my two from Philadelphia; on the 5th of May they both laid. In 22 days I had 41 eggs, and in 54 days I had 95 eggs. They are never inclined to sit. Their colour is a white ground, with black spots on their bodies; their neck white. They are a very hardy fowl, and I value them the most of any I have." Pp. 159-60, with a woodcut evidently copied from Mowbray's copper plate.

About the best part of Mr. Bement's book is his description of the poultry-houses, contrived to suit the different parts of the United States. The bowery laying places once adopted at Windsor have been imitated in America. From the above (cut in the *Illustrated News*) we took a hint, and procured some Hemlock boughs and tacked to our box nests, nearly obscuring the entrances, giving the hen an opportunity of gratifying her propensity of secretiveness. This arrangement seemed to be very satisfactory to the hens, and added much to the appearance of the room." (P. 99.) An admirable arrangement for fowls that are exposed to the rigours of a severe winter (about which we, who are frightened if the mercury approaches to zero, know nothing), is the New York poultry-house. A plan, section, and elevation ar given. Its principle lies in its consisting of two apart ments; an inner one all bricks and roof, and an outer one partially glazed in front and above (which may be made the "walk" in hard frosts); to this a flue or stove might be advantageously added. A few cents.-worth of firing a day would make it quite a go-ahead affair. A "poor man's poultry-house" with a central citadel having a thatched roof—"mind, I say *straw thatch* for roof, as it is far the best thing; and, if properly done, it will last 20 years"—and a circumscribing fortification of faggots—"go to the swamp for brush-wood, and cut a good parcel of it, leaves, small twigs, and burrs, all just as it stands"—is the very thing for Cobbett to have fallen over head and years in love with, and to have bored everyone to death till they made one like it. But the climax of all is the "plan for nest," at p. 125. A woodcut is given, but the ground-plan may be sufficient for our purpose. "The hen is a prude, and likes to steal away in some sly place to deposit her eggs. To gratify their organ of secretiveness, the following ingenious plan for fixed nests we take from the American poultry book [How long will poultry-books continue to indulge their cannibal propensities, and live by sucking each others' blood?] which has been lately contrived in Connecticut, and I have tried with complete success. Hens are well known to be anxious to deposit their eggs in secluded places. The secret nests here alluded to are well adapted to satisfy this propensity. They are made thus: Place a platform of boards, two feet wide, and, say 10 feet long, (though it may be made of any length), against a building, or a close board fence, about three feet from the ground. Along the outer edge of this platform, nail a board lengthwise and upright, about one foot high, cutting a space in the middle and at each end, as at A, B, and C, eight or nine inches wide, and divide the remaining space inside into nests a foot square, as at *a, b, c, d*, thus leaving a passage nearly a foot wide behind the nests. The top must slope from the wall, and open either in parts or entirely, with hinges, as at *h, h, h*. These nests are easily examined, and give the fowls all the secresy they seem to require." P. 125. The simple hen walks in at A, is charmed with the clear obscure, the "dim, religious light" of the passage, turns in cunningly at *a*, day by day deposits her produce, feeling as safe as if she were in the labyrinth of Crete, or in Fair Rosamond's Bower, and is one morning surprised by the uplifting of the lid, sudden daylight, and the consciousness that she has all her work to do over again! We only wonder whether the American hens have not become so 'cute as to refrain from cackling!

## METEOROLOGICAL REPORT.—April.

| | 6 p.m. | 29.85 | ... | |

* A storm coming from the west, and passing away to the eastward.

† Notwithstanding the wind continued steady at north, though light, the barometer fell slowly all the 4th (a very unusual occurrence), but on the 5th it veered to ENE. and ESE., and on the afternoon to SSW., and became very cold, with the barometer rising at night, and on the 6th was again north. We were, therefore, in the front and right-hand semicircle of this storm, which must have been at a high elevation on the 4th, coming from the westward, and passing away to the eastward, and having its central track at a considerable distance to the northward.

‡ This should be a storm travelling northward, over central Germany, from its warmth and dryness. A sirocco probably blew at Rome, the earlier part of this week.

Dorchester, April 10th. *F. P. B. M.*

(*To be continued.*)

## Miscellaneous.

*Peat Charcoal.*—I beg to hand you the result of the peat charcoal manure you sent me last June. The 30 acre field in which it was used was Wheat in 1849, sown with Rye for spring feed as soon as the crop of Wheat was harvested; the Rye was fed off with ewes and lambs from the last week in March until the 22d of May, when it was ploughed up, and on the 24th of June was drilled with Swedes; 10 three-horse cartloads of farm-yard manure per acre were put into the ridges, and 30 ridges drilled with the peat manure marked U, 24 ridges drilled with that marked N (this worked quicker in the drill, consequently did not go so far as that marked U), three ridges drilled with rapecake at the rate of 5 cwt. per acre, and the remainder of the field drilled with 5 bushels per acre of Lawes' manure. I do not know the price of the peat manure, but the rape-cake cost 22*s.* per acre, and Lawes' manure 25*s.* per acre. These Swedes were the last sown: my early sown (viz., the first 10 days in June) were a much heavier crop. The land was measured, and the Swedes weighed, after being topped and tailed in the presence of two practical farmers, as well as myself.

*Mr. Hudson, Castle Acre; in the Mark Lane Express.*

*Improved Agriculture.*—A necessary supplement to the substitution of green crops for bare fallow is increased house accommodation, as Turnips cannot be eaten on the ground on these strong lands. The house accommodation at present is inferior and inadequate. Where so much has to be done, it is very important that some economical mode of construction be adopted, for the expenditure recommended by most of our book authorities would swamp a landlord altogether. Whilst we certainly should desire something of a more permanent character, we subjoin the particulars of an estimate and specification drawn up by Mr. Gibson, which may be useful to landlords, as exhibiting a cheap method of affording increased accommodation to their tenants. With care this may last a considerable number of years, until a landlord is gradually able to get over his whole estate with buildings of a more permanent and substantial description. The system of stall-feeding is adopted as the most economical in first cost, and believed to be at least equally profitable as compared with any other in the progress of the stock. Close wooden sheds are proposed to be erected, 15 feet wide inside, with a feeding passage in front, and a cleaning passage behind the cattle. The sheds are to be made of home sawn wood, and roofed with the same, coated with coal tar. Inside they are to be fitted in the usual manner, with stalls, mangers, doors, &c. The whole may be so erected at a cost of 10*s.* per head, where the timber is got free of expense on the estate. If the value of the timber is added the cost will be 30*s.* per head. A shed 70 feet long, by 15 feet wide inside, affording accommodation for 20 cattle in stalls, 7 feet to each pair, will cost as follows:

| | £ | *s.* | *d.* |
|---|---|---|---|
| 34,000 superficial feet 1 inch deal, at 12*s.* per 1000 | 20 | 8 | 0 |

*Times Commissioners, from Durham.*

## Calendar of Operations.

APRIL.

WEST SOMERSET FARM, *April 6.*—After the unusually wet season we have experienced, the present fine dry weather, with wind from the north, is very acceptable, enabling us to proceed with the sowing of Oats and Barley, which work has been hitherto, from the above-mentioned cause, rather retarded; but we think they will stand as good a chance as the crops put in earlier, in the wet state which the land was left, which many farmers are apt to do for the sake of getting the work over, because the time for sowing has arrived, on the same principle on which some people take to wearing (chiefly amongst the middle classes), white trousers or other light clothing in April or May, or dispense with fires because spring has come, whatever the weather may be. The Wheats in this neighbourhood are forward, and farmers have been keeping them down with the sheep. The west of England is, as has been proved by meteorological tables, subject to most moisture the generality of years during winter. The cause must partly arise from the nearness of the Atlantic Ocean. On the other hand, on the East coast, there is only the German Ocean; this side of our island is consequently less forward in its pastures than the other. In Devonshire, for example, the forwardness and mildness of the district is well known; and whilst many of our aristocracy go abroad to France or Italy for the sake of a mild winter, they would find it warmer by making Devonshire or parts of Ireland their retreat. The late moist season has been very serviceable to our pastures, at all times pretty forward; and we shall buy in our yearly stock of young sheep shortly. The land is a hill farm, of a sandy loam, easy to work in unfavourable weather; but having been taken from a tenant who did not use folding, but led Turnips off the land, and left many weeds, wants sheep husbandry and good management to fetch it up. We have sown Saintfoin with the Oats, on a rather stony part of the land, on which soil it seldom fails to answer; indeed, as to Saintfoin, if she p have once been fed on it, they will in general prefer it to Clover; and it is an excellent substitute on land Clover sick, it being best to throw in a portion of Hop Clover with the Saintfoin—the quantity of seed per acre 4 bushels. Our labourers have had great assistance this winter in the place, road-making, &c., on this estate, and are receiving generally 10*s.* per week. *H. E.*

## Notices to Correspondents.

BARLEY: *Constant Reader.* 2 or 3 cwt. of Peruvian guano per acre sown broadcast in wet weather and harrowed in.

DEEP DRAINS: *Tyro.* The water does get down, for if you dig there you will find that the clay is wet—not dry. If it gets there a channel at that depth will remove it. To put broken stones over the pipes is a useless expenditure. To ram the clay down over the pipe is not advisable; the object should be to restore the clay *over* the tiles to the same consistency as that of the undisturbed clay *around* the tiles. If your drain acts only by the porosity of the moved earth about it, it will be a failure.

MILK: *E. Hulme* says:—"I have a cow slipped calf one month before her time; her milk has not come, could I give her anything to excite its secretion?" Better let Nature alone. *W. C. S.*

OPEN FURROWS: *Erratum.* On looking again at Mr. Mechi's remarks on open furrows, I find that in my former communication I misstated the width between a portion of his drains. It is 28 feet instead of 36 feet. This makes a material difference, but even the former width will most likely prove too great for his soil, whatever may be the depth adopted. *James Donald.*

PRINCE OF WALES POTATO: *Messrs. Wheeler of Gloucester.* We can speak from personal experience to the excellent quality, productiveness, and *earliness* of this variety.

RACING: *A Novice.* It is *not* customary in racing to weight horses according to their height, although this custom is sometimes observed in pony racing, the conditions however being specified. *W. C. S.*

ROT IN SHEEP: *K.K.* There is certainly some danger to be feared from turning sheep on watered meadows at this time of the year. *W. C. S.*

TRENCHING: *Northwood.* We would not bury Couch Grass; and we would not trench now till the autumn. If the Potatoes are well cultivated, the Couch Grass will be got rid of before them; and the cleanliness of the land, and the coming of a winter's frost before the trenched land is cropped, will all be in favour of the operation.

## Markets.

COVENT GARDEN, APRIL 12.

Hothouse Grapes, both white and black, are becoming more plentiful, and, considering the little sunshine we have had, they are exceedingly well flavoured. Good Pine-apples are scarce, as are also dessert Apples. Oranges and Lemons are plentiful. Nuts remain nearly the same as last week. Forced Strawberries are more plentiful. Vegetables of all kinds are abundant and good. French Beans and Cucumbers are plentiful. Carrots and Turnips are good in quality. New Cornish Potatoes may be obtained at from 1*s.* to 2*s.* per pound. Lettuces and other salading are sufficient for the demand. The best Mushrooms fetch 1*s.* 3*d.* per pottle. Cut flowers consist of Heaths, Pelargoniums, Camellias, Mignonette, Double Primroses, Stephanotis floribunda, Cinerarias, Moss and Provins Roses, and the different kinds of spring bulbs.

FRUIT.

COAL MARKET.—FRIDAY, April 11.

Holywell, 14*s.*; Eden Main, 14*s.* 9*d.*; Wallsend Riddell, 13*s.* 6*d.*; Wallsend Haswell, 15*s.*; Wallsend Hetton, 15*s.* 9*d.*; Wallsend Lambton, 15*s.* 6*d.*; Wallsend Stewarts, 15*s.* 9*d.*; Wallsend Tees, 14*s.* 9*d.*—Ships at market, 147.

POTATOES.—SOUTHWARK, April 7.

The Committee report that there have been several fresh arrivals from Scotland since our last report. Trade is exceedingly heavy, and it is only with the very best samples our highest quotations are realised:—York Regents, per ton, 70*s.* to 90*s.*; Scotch do., 60*s.* to 75*s*; ditto Cups, 60*s.* to 70*s.*; Cambridgeshire and Lincolnshire Regents, 50*s.* to 75*s.*; French whites, 50*s.* to 60*s.*

SMITHFIELD, MONDAY, April 7.

We have a large number of good Beasts on sale to-day. The fine cold morning is in favour of the trade, still it is dull, and our top quotations are realised with difficulty. The supply of Sheep is also larger; the demand, however, is adequate, and prices are not much lower. Lambs do not meet with so ready a sale as on Friday last. No alteration in the Calf trade. From Holland and Germany there are 421 Beasts, 69 Calves, and 153 Pigs; from Norfolk and Suffolk, 2500 Beasts; from Scotland, 500; and 120 from midland counties.

| Per st. of 8 lbs.—*s* | *d* | *s* | *d* | Per st. of 8 lbs.—*s* | *d* | *s* | *d* |
|---|---|---|---|---|---|---|---|
| Best Scots, Herefords, &c. | 3 6 | to 3 | 8 | Best Long-wools | 3 10 | to 4 | 2 |

| Ditto Shorn ... ... | | | | Lambs ... ... | ... | | |
| | | | | Calves ... ... | 3 0 | — 4 | 4 |
| | | | | Pigs ... ... | 2½ | 8 — 3 | 8 |

Beasts, 4100; Sheep and Lambs, 23,110; Calves, 135; Pigs, 460.

FRIDAY, April 11.

We have a larger number of Beasts than the trade requires; several remain unsold, although there is a disposition to take lower prices. There is a good supply of Sheep, trade is very dull, at lower rates. Choice Lamb is in demand, but 6*s.* is an extreme quotation. There is a large number of middling Calves on offer; a choice one is not much lower. From Germany and Holland we have 25 Beasts, 390 Sheep, and 201 Calves; from Scotland, 40 Beasts; from Norfolk and Suffolk, 400; and 82 milch cows from the home counties.

MARK LANE.

MONDAY, April 7.—The supply of Wheat from Essex and Kent to this morning's market was small, and was taken off at the prices of this day se'nnight; the demand for foreign slow, and without alteration.—Barley, Beans, and Peas, sell freely at last week's rates.—Oats are held firmly at the late advance, without leading to much business.

FRIDAY, April 11.—With the exception of 6100 sacks of Flour and 17,030 qrs. of Oats the arrivals of all articles since Monday are small. The market this morning was again thinly attended, and although there was no disposition to purchase either English or foreign Wheat, holders showed no inclination to give way in price.—Barley, Beans, and Peas remain without alteration.—There is a fair sale for Oats at barely the prices of Monday.—In Black Sea Wheat and Indian Corn there is little doing: a cargo of Egyptian Wheat has been sold at 23*s.* 6*d.*, cost, freight, and insurance.—Flour meets a dull sale at late rates.—We notice but little variation in the Corn trade since our remarks of the 4th inst; the markets throughout the country have been characterised by a general dulness, and the prices of Flour continue to have a downward tendency. The weather, which has been very unsettled, retards spring sowing, and is very unfavourable for the Barley that was committed to the ground the early part of March.

LIVERPOOL, TUESDAY, April 8.—The arrivals of grain and Flour this week have been moderate, both from our own coast and from foreign ports. The business transacted at our Corn Exchange this morning was very moderate. As regards Wheat and Flour, the value of any description was barely supported; but, from scarcity, there was an improvement on last Tuesday's price of 1*s.* per qr. on Indian Corn, 6*d.* per qr. on Egyptian Beans, and 1*d.* per bushel on mealing Oats. The best American yellow Indian Corn brought 32*s.* per 480 lbs. Barley, Beans, and Peas were unchanged in value.——FRIDAY, April 4.—The arrivals since Tuesday from Ireland and coastwise are very light of every article. The trade during the week has been quiet, but in the sales made of Wheat and Flour former prices have been supported. At this morning's market there were but few dealers, who purchased sparingly of Wheat and Flour at Tuesday's prices. Oats of good quality being scarce, advanced ½*d.* per 45 lbs., and Oatmeal fully supported late rates. Barley and Peas without change in value, but Beans must be quoted 6*d.* per qr. dearer. Indian Corn was held for rather higher prices, but the sale was slow, at 30*s.* 9*d.* to 31*s.* for new, and 31*s.* 6*d.* per 480 lbs. for old yellow American.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will Sell by Auction, at the Mart, Bartholomew-lane, on TUESDAY, April 15th, WEDNESDAY, 16th, and THURSDAY, 17th, 1851, at 12 o'clock each day, a first class collection of Carnations, Picotees, Pinks, and Auriculas; also Dahlias in Roots, Fancy and other Geraniums, Chrysanthemums, Fuchsias, Verbenas, Camellias, Roses, &c. May be viewed the morning of Sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

EAST INDIAN AND AFRICAN ORCHIDS.

MR. J. C. STEVENS begs to announce for Sale by Auction, at his Great Room, 38, King-street, Covent Garden, on TUESDAY next, 15th inst., at 12 for 1 o'clock punctually, A CONSIGNMENT OF ORCHIDS, made by a gentleman residing in Sylhet, the grand feature of which is Vanda cærula (the Blue Vanda), recently figured and so much admired; there are several fine plants of this charming species. Also, a few specimens of an Aerides, collected by Mr. R. W. PLANT, in Africa, near Natal.—May be viewed on the morning of sale, and Catalogues had.

MR. HASLAM will Sell, at the Auction Mart, London, on TUESDAY, April 15, 1851, a collection of Standard and Climbing Roses, Tea and other Roses, in bloom; Dutch Peach, Apricot, and Nectarine Trees, Herbaceous Plants, &c.—Catalogues to be had at the Mart, and of the Auctioneer, Epping, Essex.

BEDFORDSHIRE.—Great Barford, near Bedford, Biggleswade and Sandy valuable Freehold Estate, Tithe free, and Land Tax redeemed, giving Votes for the County.

MR. EDWARD PALMER will Sell by Auction, by order of the Mortgagee, at the Golden Cross Inn, Great Barford, near Sandy, Bedfordshire, on TUESDAY, 13th of MAY next, at 1 o'clock, in 11 Lots of about 3 Acres each, an important Freehold Estate, consisting of about 34 Acres of land, all adjoining and delightfully situated on an eminence facing the south, at the entrance of the village of Great Barford, from Bedford, near the Wesleyan Chapel, having an extensive frontage to the road, and commanding a beautiful prospect. The land is of excellent quality, and suitable for building cottages with garden ground attached, the cultivation of which in this neighbourhood has been found so exceedingly profitable from the easy transit of vegetables by rail to the London markets.—N.B. Two-thirds of the purchase money may remain on mortgage if required, or the whole, if satisfactory security is given. Particulars, with plan and conditions of Sale, may be had 14 days prior to the Sale, of Mr. Benjamin Chandler, jun., Solicitor, Sherborne, Dorset; and Messrs. Poole and Gamlen, Solicitors, 3, Gray's-inn-square, London; Mr. W. Wallen, jun., Architect and Surveyor, 14, Basinghall-street, City, and Greenwich, Kent; at the Law Property Assurance and Trust Society's Offices, 30, Essex-street, Strand; at the Golden Cross Inn, Great Barford; Swan Inn, Bedford; White Swan, Biggleswade; and at the Auctioneer's Offices, 20, Change-alley, Cornhill, London.

THE MOST SUPERB BED OF TULIPS IN EUROPE.

MR. R. LAWRENCE, of Hampton, will sell his unrivalled bed of TULIPS, of the splendour of which some idea may be formed by the number of fine varieties: viz., 30 Louis XVI., 16 Musidora, 12 Pompe Funebre, 12 Fabius, from 4 to 10 each of Bysantium, Pandora, Parmigiano, Brown's Polyphemus, ditto Ulysses, Dicken's Duke of Devonshire, Marcellus, Rose Arlette, Lyde's Queen of Hearts, Brown's Magnificent, Strong's King, Nora Criena, Thalia, Vivid. Besides several each of Lac, Coronation, Iago, Apelles, Salvator Rosa, Lord Collingwood, Marshal Soult, Selim, Groom's Queen Adelaide, Lady Exeter, Laura Lawrence, Hepworth's Queen of the North, Dutch Ponceau, Goldham's Maria, Brown's Sylvia, Jeffrey's Elizabeth, La Belle, Nanette, Lawrence's Lady Sale, and nearly every flower that has been raised worth cultivation, by Lawrence, Clarke, Lyde, Dixon, Strong, Walker, Glenny, Goldham, Brown, Groom, &c. Persons desirous of receiving Catalogues, may send their addresses to Mr. R. LAWRENCE, Red Lion, Hampton (where the bed may be seen, from the 1st of May to the day of sale); Mr. LOCKHART, 84, Fleet-street; and Mr. GLENNY, Strand. Catalogues will also be forwarded to the principal Seedshops.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

TO BE DISPOSED OF.—A Lady, in the neighbourhood of St. John's Wood, is desirous of disposing of an Ornamental Wood SUMMER HOUSE, ditto Table to match, and Garden Seat, made by Prior, of Cricklewood.—Apply to JOHN ANDREW HENDERSON and Co, Nurserymen, Pine Apple-place, Edgeware-road, London.

TO GARDENERS, FLORISTS, AND OTHERS.

TO BE LET, for a term of years, a very compact and desirable NURSERY BUSINESS within four miles of London, in an improving Neighbourhood. The above contains a Cottage, four Greenhouses, with Pits, Frames, a good supply of Water, and every other convenience in trade.—For further particulars, Direct to A. B., Messrs. Neal and Co., Cavendish House, Wandsworth-road, South Lambeth, Surrey.

HARTLEY'S PATENT ROUGH PLATE-GLASS FOR CONSERVATORIES, &c.

See Article in the GARDENERS' CHRONICLE of Saturday, December 8, 1849.

ELEY AND CO., HOT-WATER APPARATUS MANUFACTURERS, HOTHOUSE AND IMPROVED PIT BUILDERS, beg to inform the Nobility and Gentry, they, being practical and working men, defy competition, and are enabled to supply their IMPROVED PORTABLE CAST-IRON BOILERS, requiring no Brick-work, being more durable than Copper or Wrought-Iron, and surpass all others. Building and Hot-water Apparatus arranged so that any gentleman's tradesman can fix them, or their own services can be had at a trifling expense. Can be highly recommended by the nobility and gentry, for whom the most complete works have been erected.—The Trade supplied. Estimates free. Boilers of every description supplied. Conservatories in Metal, Iron, or Wood on the most ornamental designs.—Address, City-road, near the Toll-gate, London.

Buildings or Sashes supplied glazed or unglazed. Price of Boilers from 2*l.* 10*s.* to 6*l.*, equal to those charged 15*l.*

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.
WARRANTED BEST MATERIALS AND WORKMANSHIP, AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

EXHIBITION, 1851.—HOME EVERYWHERE.—TENTS for the MILLION, at BENJAMIN EDGINGTON'S Marquee, Tent, Flag, and Rick Cloth Manufactory, 2, Duke-street, Southwark. A Warehouse, 203, Piccadilly.

The following Second-hand Marquees to be sold reasonably—250 feet by 28, 180 feet by 40, 120 feet by 33, and 150 feet by 20. Netting, Bunting, and Scrims for Fruit Trees.

Emigrant Tents fitted up complete.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S  ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

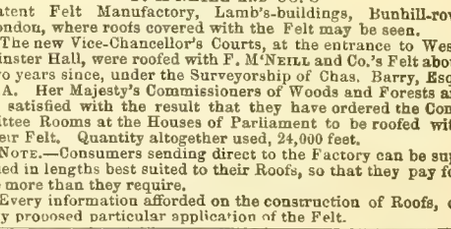
HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.



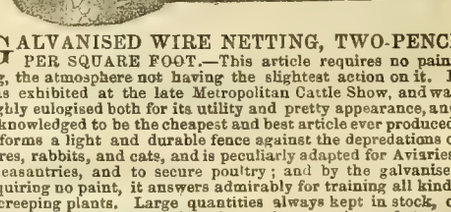
☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are F. M'NEILL AND CO.'S Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.



| | | Galvanised, | Japanned Iron. |
|---|---|---|---|
| 2-inch mesh, light, 24-inch wide | ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch ,, strong ,, | ... | 9 ,, | 6½ ,, |
| 2-inch ,, extra strong ,, | ... | 12 ,, | 9 ,, |
| ¾-inch ,, light ,, | ... | 8 ,, | 6 ,, |
| 1½-inch ,, strong ,, | ... | 10 ,, | 8 ,, |
| 1½-inch ,, extra strong ,, | ... | 14 ,, | 11 ,, |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

12 inches wide 3*d.* per yard. | 30 inches wide 7½*d.* per yard.
18 ,, ,, 4½*d.* ,, | 36 ,, ,, 9*d.* ,,
14 ,, ,, 6*d.* ,, | 48 ,, ,, 1*s.* ,,

Galvanised do., 1*d.* per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each. Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

DO YOU BRUISE YOUR OATS?

HORSE KEEP.—Oat Bruisers, Chaff Cutters, Ploughs, 42s., Shares, 5s. per dozen; Rollers, Wheat Mills, Bean Mills, Steam Engines, Scarifiers, Turnip Cutters, Dressing Machines, Drills, Threshing Machines, Wood and Iron Harrows, Steaming Apparatus, Scotch Carts, Hay-making Machines, Horse Hay Rakes, and Drag Mills. First class goods warranted. Mary Wedlake and Co., 118, Fenchurch-street. Most liberal discount for cash. Goods delivered free. On receiving six postage-stamps a list, with 107 engravings, will be sent free.

IRON GATES, HURDLES, &c.

THOMAS PERRY AND SONS, 252, OXFORD-STREET (NEAR HYDE-PARK), And Highfields Wrought and Cast-iron Works, Bilston, Staffordshire, Manufacturers of every description of Park Entrance, Carriage and Field Gates, Wickets, &c.; Plain and Ornamental Fencing and Palisading; Ox, Cattle, Sheep and other Hurdles; Tree Guards, Garden Seats, Hay Racks, Wheelbarrows; Land and Garden Rollers, Stable Fittings, &c. &c.

The works being situated in the centre of the Staffordshire Iron district, Thomas Perry and Sons are enabled to execute promptly orders to any extent with the greatest facility, of the best quality, and most moderate terms. A great variety of the above articles always kept in Stock at the London Warehouse, and at the Works. Drawings and prices may be obtained on application, or furnished free by post.

STEPHENSON and Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

BEE HIVES.

GEORGE NEIGHBOUR and SON respectfully announce that they have prepared for this season an extensive supply of their various IMPROVED BEE HIVES, which are offered to all who are desirous of cultivating that pleasing and profitable branch of rural economy—the Honey Bee. The collection consists of "Nutt's Collateral Hives," "The Single Box Hive," "The Amateur Bar Hive," "The Improved Cottage Hive," &c., from either of which the honey may be taken at any time without injury to the Bees, and may be worked with safety, humanity, and profit, by the most timid and unaccustomed to Bee manipulation. A descriptive paper, with drawings and prices, will be forwarded on the receipt of two postage stamps.—127, High Holborn, London.

Agents: Wm Drury, Castle-street, Liverpool; Hall and Wilson, 50, King-street, Manchester; Austin and M'Aslin, 168, Trongate, Glasgow.

NETTING, FLAGS, AND BUNTING.—Tanned Garden Netting, for protecting Fruit Trees from Frost, Blight or Birds; or as a Fence for Fowls, Pigeons, Tulip and Seed-beds, can be had in any quantity from John King Farlow's Fishing-rod and Net Manufactory, 5, Crooked-lane, London-bridge, at 1½d., 1 yard wide, 3d. 2 yards, or 6d., 4 yards wide. Woollen Bunting, any length or width, at 6d. per square yard. Forwarded to any part of the kingdom on receipt of remittance, Post-office order, or stamps. Several good second-hand Flags to be sold cheap.

LINGHAM BROTHERS, 170, Hampton-street, Birmingham, sole Manufacturers of the improved WOOD and ZINC MENOGRAPH, or Label for Garden Borders, Flower-pots, &c., in boxes of 100, &c. The Zinc Labels are highly approved of for their lasting durability; can be written upon with the greatest ease, and, when dry, a permanent inscription is secured. Directions for use sent with each box, including bottle of Metallic Ink.

Sole Agents in London, G. and J. Deane, Horticultural Implement Warehouse, 46, King William-street, London Bridge.

PURVEYOR TO HER MAJESTY, H.R.H. PRINCE ALBERT, AND THE KING OF THE NETHERLANDS.

FERNS.

NOTICE.—The new Part (Part V.; or Volume the Second, Part I.) of Sir William Hooker's SPECIES FILICUM will be ready on April 28.

London: William Pamplin, 45, Frith-street, Soho.

SPLENDID WORKS ON NATURAL HISTORY.

EDWARDS'S BOTANICAL REGISTER, consisting of Coloured Figures of Plants and Shrubs cultivated in British Gardens, with their History, Treatment, &c. New Series Edited by Dr. Lindley, with 750 *beautiful coloured plates*, 10 large vols. royal 8vo, new cloth, 5*l.* 15*s.* (pub. at 22*l.*) 1838-47.

This is the new and complete series of this beautiful and esteemed work. As the number for sale is very limited, early application is desirable.

MEYER'S BRITISH BIRDS and their EGGS, 322 *beautiful coloured plates*, with Descriptions. 7 vols. 8vo, in 108 Parts (just published at 18*l.* 18*s.*), only 8*l.* 8*s.* 1841-50

This beautiful publication is the most complete illustrated History of British Birds. The figures are all drawn from nature.

CUVIER'S ANIMAL KINGDOM, arranged according to its Organisation, being a description of Quadrupeds, Birds, Fishes, Insects, Shells, &c. By Cuvier and Latreille. Translated from the last French edition, with 4000 figures, mostly coloured, on 800 plates, 8 vols. 8vo, half morocco, 3*l.* 10*s.* (pub. at 8*l.* 8*s.*) 1837.

This is the most scientific and general work upon the subject, and the only one upon Natural History suitable for a "Home Library."

WOOD'S BRITISH ENTOMOLOGY, or Illustrated Catalogue of the Lepidopterous Insects of Great Britain, containing 1944 *figures, beautifully engraved and coloured, of all the Butterflies and Moths*, with an Account of their Localities, &c. 8vo, cloth, 3*l.* 10*s.* (pub. at 8*l.* 3*s.*) 1845.

The most complete illustrated work on British Butterflies and Moths. The figures are executed with remarkable beauty and fidelity. Very few copies remain for sale.

G. WILLIS, GREAT PIAZZA, COVENT GARDEN.

THE QUARTERLY REVIEW, No. CLXXVI., is Published this Day.

EVERY-DAY WONDERS; or, Facts in Physiology which all should know. With Woodcuts. 16mo, 2*s.* 6*d.*

DOMESTIC SCENES IN GREENLAND AND ICELAND. With Woodcuts. Second Edition. 16mo, 2*s.*

INSTRUMENTA ECCLESIASTICA. Edited by the Ecclesiological, late Cambridge Camden Society. Second Series. Parts 1 to 3, each 2*s.* 6*d.*

A HISTORY OF BRITISH MOLLUSCA AND THEIR SHELLS. By Professor Edward Forbes, F.R.S., and Sylvanus Hanley, B.A., F.L.S. Parts 25 to 34. 8vo, 2*s.* 6*d.* plain, or royal 8vo, coloured, 5*s.* each.

This work is in continuation of the series of "British Histories," of which the Quadrupeds and Reptiles, by Professor Bell; the Birds and Fishes, by Mr. Yarrell; the Birds' Eggs, by Mr. Hewitson; the Starfishes, by Professor Forbes; the Zoophytes, by Dr. Johnston; the Trees, by Mr. Selby; and the Fossil Mammals and Birds, by Professor Owen, are already published. Each Work is sold separately, and is perfectly distinct and complete in itself.

THE PORTRAIT OF PROFESSOR HARVEY, due to Purchasers of his "Manual of British Marine Algæ," may now be had in exchange for the "Notice" prefixed to the volume.

John Van Voorst, 1, Paternoster-row.

PRINTED IN THE CRYSTAL PALACE.—The PARLOUR MAGAZINE of the LITERATURE OF ALL NATIONS. To be continued weekly, price 2*d.* It will be the largest and the cheapest of the weekly Magazines. The first Number will be a double one, at the Single Price. One-half of it will be devoted to an ably-written article—HOW TO ENJOY LONDON DURING THE EXHIBITION. A beautiful STEEL ENGRAVING will be given with the Number.

London: Printed in the Crystal Palace; and published by Houlston and Stoneman, and Booksellers everywhere.

Now ready, at all the Booksellers, No. 1, price 2*d.*, published weekly.

THE LOOKER-ON; a Record of the Literary, Artistic, and Scientific World, suited for Family Reading.

The Proprietors of the 'Looker-on' propose to give, in a more popular form, and at a cheaper rate, such matter as has hitherto only appeared in the first-class literary journals; thus in each number will be found a popular essay, an original tale, an analytical review of the last new books, an independent critique of the play or opera of the day, an original poem, notes and queries for the curious and inquiring, a letter containing the chit-chat of the Parisian world, pen and ink pictures; also the gossip of the scientific, artistic, dramatic, musical, and literary world.

The aim of the "Looker-On" is to combine amusement with information, without throwing aside that high moral tone so necessary in a family journal.

THE GOWNSMAN OF ALL SOULS, a Legend of Oxford, will be published weekly in this Journal.

A Specimen Number, 16 pages large octavo, price 2*d.*, will be sent free by post, on receipt of four postage stamps, by the publisher, John Lofts, 368, Strand, London.

WANTED TO RENT, on LEASE, within 10 miles of London, a small, low-rented place, adapted for a Florist for growing Plants for market; one with some Glass Erections on it will be preferred.—Address, stating full particulars to A. B., care of Mr. Nettleton, 2½, Queen-street, Gainsford-street, Horslydown.

Printed by William Bradbury, of No. 13, Upper Woburn-place, in the parish of St. Pancras, and Frederick Mullett Evans, of No. 7, Church row, Stoke Newington, both in the County of Middlesex, Printers, at their Office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said County, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, April 12, 1851.

The Great General Catalogue of Plants, &c., may be had free at Mr. R. SILBERRAD'S, 5, Harp-lane, Great Tower-street, London.

CHEAP DAHLIAS.

HENRY LEGGE begs to inform the Floral Public that he intends seading out, in May next, all the leading Flowers of 1850, at 9*s.* to 12*s.* per dozen; all the good old varieties, from 3*s.* to 4*s.* per dozen. Ground Roots cheap of most of the favourites. Catalogues can be had, on application, by inclosing one postage stamp to HENRY LEGGE, Marsh Side, Lower Edmonton, Middlesex.

NEW DAHLIAS, 1851.

E. SPARY begs to announce he will be prepared to send out, in May, the under-mentioned superior DAHLIAS, viz.—

VENUS (Cook's).—Exquisite golden orange, fine form, distinct colour. Will prove a great acquisition to the most limited grower. Received a Certificate at the Great Metropolitan Show, where it was much admired. Price 7*s* 6*d.*

FLORA (Cook's).—Crimson red, tipped with yellow; first-rate form, and constant. Price 7*s.* 6*d.*

MRS. WILLIS (Liddiard's).—Dark marone, tipped with white; constant and fine habit. Price 7*s.* 6*d.*

Also the select sorts of the last and former years, at moderate prices.

Geraniums, Fuchsias, Verbenas, and Spary's Double Pansy (Prince Arthur) 24*s.* per dozen; with a variety of Bedding-out Plants. Fine Hothouse Grapes cut to order from May to January. Cut Flowers and Bouquets, Seeds, &c.

Queen's Graperies, near German Spa, Brighton, April 19.

SEED AND HORTICULTURAL ESTABLISHMENT, SUDBURY, SUFFOLK.

BASS AND BROWN'S SEED AND PLANT LIST FOR 1851 *is stamped as a Newspaper, to go free by post, and may be had on application. It will be found to contain the newest and best articles which can be procured, with full description and other useful information.*

WM. RUMLEY and SONS, Gilling, near Richmond, Yorkshire.

BEAUTIFUL NEW SHRUBBY CALCEOLARIAS AND PANSIES.

MR. HENRY MAJOR, Knosthorpe, near Leeds, begs to announce that his 12 new and much-admired SHRUBBY CALCEOLARIAS are now ready to send out. The set of 12 for 3*l.*, or half the set for 30*s.*, provided the selection be left to H. M. Most of these Seedlings were submitted to the Censors at the Worton Cottage Meetings last season, and highly spoken of. Four of them are figured in the *Florist* for December. Twelve very good CALCEOLARIAS, including four or five Seedlings not yet out, price 20*s.* Very choice CALCEOLARIA SEED, at 2*s.* 6*d.* and 5*s.* per packet.

NEW SEEDLING PANSIES.

H. M.'s three very distinct and beautiful Seedling Pansies, viz, "Captivation," "Novelty," and "Sambo" are now ready to send out. They are a valuable acquisition to this lovely family. Healthy Plants, 5*s.* each, or the three for 10*s.* 6*d.*, post free. For opinion upon them, see *Florist* for August and October, 1850. Twenty of the best Show Pansies (including "Sambo,") for 25*s.*, post free. For names, see descriptive list. Very select Pansy Seed, at 2*s.* 6*d.* and 5*s.* per packet. The 5*s.* packets are equal to three packets at 2*s.* 6*d.* A Descriptive List of the Calceolarias and Pansies may be had on prepaid application.—Orders from unknown correspondents, enclosing Post-office order, payable at Leeds Post-office, will be duly attended to.

DAHLIAS.—MR. GEORGE GLENNY says, "Yours is the *very best* Dahlia out; 2000 plants would be sold if kept back and exhibited this year," also, "it would be fooled away to let it out now." This, however, is unavoidable. The bloom is absolute perfection, and perfectly constant; named by Mr. Glenny, Morgan's King of the Dahlias, and pronounced by him "best of all the crimsons," and "best of all the Dahlias." Height, 4 feet. Plants, first week in May, 10*s.* 6*d* each. The usual allowance to the trade, where a dozen are ordered.—Unknown correspondents are requested to remit to ABRAHAM MORGAN, Cross-street, Oswestry, Shropshire.

FIFTY-FOLD KIDNEY POTATO.

JAMES LAKE, NURSERYMAN, &c., Bridgewater, Somerset, begs to inform the public that he is now sending out his Seedling Fifty-fold Kidney Potato, six tubers of which were sent to Dr. Lindley, April 29th, 1850, and produced 312, quality very good; six tubers also sent to Beck, Henderson, and Co., at the same time, produced 580, although grown in poor ground. Price 4*s.* per peck.—London Agents: HURST and M'MULLEN, 6, Leadenhall-street.

J. L. having grown from 15 to 20 lights of Aban's Conqueror of the West CUCUMBER, successfully for three years, can with confidence recommend it to the public as being one of the best kinds in cultivation. Packets containing 12 seeds, 1*s.* each.

NEW DAHLIAS.

CHARLES TURNER will be prepared to execute orders on the 1st of May for the following varieties, which are very superior flowers, and should be in every collection grown for exhibition:—

NEPAULESE PRINCE (STEIN) crimson, shaded with dark maroon, very superior constant show flower, being an improvement on Richard Cobden; has obtained numerous first prizes in class showing and six first-class certificates ... ... ... ... ... 10 6
NIL DESPERANDUM (STEIN) vivid scarlet, unquestionably the best of its class, the petal good, flower of great depth, and finely developed, one of the leading flowers of the season; has been very successful ... ... ... 10 6
BARMAID (HOLMES) white, occasionally tinged, but generally a fine white of unusual substance ... ... 10 6
ROUNDHEAD (HOLMES) salmon buff, deep, full, finely formed flower, good grower, at all times to be depended on; habit particularly good; took certificates at Metropolitan, Royal South London, and Norwich ... ... 10 6
NAPOLEON (PARKER) rich vermilion, of a novel and striking shade, flower deep and symmetrical, constant and good habit; certificate at Wycombe ... ... 10 6
REGINA (HALE) shaded rose, smooth good petal, well formed, good size; took certificate at Royal South London ... ... ... ... ... ... ... 10 6
SIR CHARLES NAPIER (HALE) rich scarlet, fine firm flower, finely formed and closely set, handsome close centre; took certificate at Highgate ... ... ... 10 6
JULIEN (HALE) rosy purple, nearly cupped, of great depth; took certificates at Slough and Notting Hill ... 10 6

FANCY DAHLIA.

MRS. HANSARD (UNION) raised by J. Edwards, Esq.; yellow, with distinct white tips, fine form, and full size; very true and constant in every respect; a noble addition to this class; has been eminently successful at 12 of the principal shows ... ... ... ... ... 10 6

CHOICE NEW FUCHSIAS,

WHICH WILL BE READY WITH THE DAHLIAS.

EXPANSION (BANKS) pure white tube and sepals, bright rose corolla, very stout and abundant bloomer, one of the best light varieties ... ... ... ... ... 7 6
VOLTIGEUR (BANKS) crimson tube and sepals, dark purple corolla, the sepals reflex well, and show the rich corolla to great advantage ... ... ... ... 7 6
CONSPICUA (BANKS) white tube and sepals, vermilion corolla, very large and attractive ... ... ... ... 7 6
PRINCESS (BANKS) white, red corolla, very free bloomer, and good habit ... ... ... ... ... ... 5 0
DUCHESS OF KENT (KNIGHT) blush tube, sepals tipped with green, vermilion corolla, exceedingly long handsome flower ... ... ... ... ... ... ... 7 6
ELECT (BANKS) crimson tube, rosy purple corolla, of fine habit ... ... ... ... ... ... ... 5 0
MADAME SONTAG (BANKS) white tube, bright vermilion corolla ... ... ... ... ... ... ... 5 0
AJAX (HOCKEN) large dark, fine habit ... ... ... 5 0
BRILLIANT (BANKS) crimson, purple corolla, good habit, and very free bloomer ... ... ... ... 5 0
LOVELINESS (BANKS) small pleasing light ... ... 3 6

General Catalogue can be had on application.

Royal Nursery, Slough, near Windsor.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, BREWERS' USE, &c.
FLEXIBLE INDIA RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES for TUBING.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, Gas Fittings, Chemical and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required.

Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently Flexible in all Temperatures, and are therefore particularly suitable for Fire Engines; and, from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes.

A LIGHT VULCANISED INDIA-RUBBER HOSE is now manufactured for conducting Water and Fluids, at the following prices per foot:

| Size. | ½ in. | ⅝ in. | ¾ in. | 1 in. | 1¼ in. | 1½ in. | 2 in. | 2½ in. | 3 in. |
|---|---|---|---|---|---|---|---|---|---|
| 1 ply ... | 0*s.* 5*d.* | 0*s.* 6*d.* | 0*s.* 8*d* | 0*s* 10*d.* | 1*s.* 0*d* | 1*s.* 2*d.* | 1*s.* 4*d* | 1*s.* 6*d.* | |
| 2 ply .. | 0 8 | 0 9 | 1 0 | 1 2 | 1 5 | 1 8 | 2 0 | 2 8 | |
| 3 ply .. | 0 11 | 1 0 | 1 3 | 1 6 | 1 10 | 2 2 | 2 9 | 3 3 | |

N.B. Vulcanised India-Rubber Garden Hose fitted with roses, jets, and branches, complete, with union joints ready to attach to pumps or water cisterns.

All orders or letters addressed to J. L. HANCOCK, at the Manufactory (and Warehouse), Goswell-mews, Goswell-road, London, will meet with immediate attention.

CUCUMBER and MELON BOXES and LIGHTS.

One hundred 1, 2, and 3-light Boxes and Lights of all sizes, ready for immediate use. Warranted best materials, packed and sent to all parts of the kingdom; 2-light Boxes and Lights from 1*l.* 4*s.* Garden Lights of every description, Conservatories, Green and Hot-houses, made and fixed in all parts of the kingdom. References given to the Nobility, Gentry, and the Trade, in most of the counties of England.—JAS. WATTS, Hothouse Builder, Carnarvon-place, Old Kent-road, London.

GREENHOUSE.—Wanted, to purchase, a SMALL SECOND-HAND GREENHOUSE, in good condition, and complete. Size, about 14 feet by 8. Any person having such a Greenhouse to dispose of, is requested to apply by letter, post paid, stating price and dimensions, to A. B. C., 345, Strand, London.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

Height in front, 3 feet 6 ins. wood and glass; 3 feet 6 ins. brickwork.

These Greenhouses are prepared in such a manner that any country carpenter can fix them with ease. A plan is sent free for the brickwork, &c.

Estimates for erecting and heating the above, on application. Lists of prices for Sashes, Doors, &c., post free, on application.

J. LEWIS, Horticultural Works, Stamford-hill, Middlesex.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, April 19.

AZALEA INDICA "SYMMETRY" (KINGHORN.)—The celebrity this Flower has gained, and the eulogium that has been bestowed upon it, render it only necessary to mention the opinions of competent judges, the awards it has received, and simply to add that it is superior in shape and substance to any variety hitherto introduced, and equal in colour and habit to the most popular kinds. In May, 1850, a first class certificate was awarded to it by the London Floricultural Society, and it was thus described in the *Gardeners' and Farmers' Journal*. "Azalea indica Symmetry is a magnificently formed flower, of extraordinary substance; colour salmonish pink, varying to light scarlet, richly spotted in the throat with deep crimson; size large." At the June show, 1850, at Chiswick, it obtained the Silver Banksian Medal, and was recorded in the *Gardeners' Chronicle* as "a considerable improvement on Lateritia." JOHN and CHARLES LEE having purchased the stock of Symmetry, intend sending out healthy Plants on the 1st of June, price 21s. each.—Nursery and Seed Establishment, Hammersmith, near London.—April 19.

NEW DAHLIAS; E. FOSTER'S, ESQ., CHOICE PELARGONIUMS; PICOTEES, CARNATIONS, HOLLYHOCKS, PANSIES, &c.

WILLIAM BRAGG, Star Nursery, Slough, begs to say his Catalogue of the above Flowers is now ready, and can be had on application. His choice SEEDLING DAHLIAS will be sent out the first week in May at 10s. 6d. each, viz.:—

ADMIRAL, rich lilac, very constant, gained first Seedling prize, 25s., at the Royal South London Exhibition; 21s. Shacklewell Open Shows, &c., fourteen first class certificates; the most successful flower of the year.

CARMINA, rich carmine, constant show flower, gained six first class certificates, &c., shown in several winning stands.

The Hon. MRS. ASHLEY, waxy white, tipped with rose, splendid show flower, &c. W. B. thinks it the best Dahlia of the season; was awarded by Dr. LINDLEY a certificate of merit at the Horticultural Society, &c. Gained five first class certificates.

QUEEN OF FAIRIES, Domeyer. W. BRAGG has purchased the stock of this fine and constant fancy Dahlia, from the above amateur, who will give 5l. in prizes the next season for this flower. It gained a Seedling prize and first class certificate, with Edwards's Mrs. HANSARD; at the Royal South London Open Show Exhibition five first class certificates.

W. B.'s stock of Picotees, Carnations, and Pinks are strong and good; the best Hollyhock Seed ever sent out can be had in 2s. 6d. and 5s. packets, post paid, for prepayment.

AUGUSTE VAN GEERT, NURSERYMAN, Ghent, Belgium, begs to inform the Amateur, and Trade in general, his new CATALOGUE OF PLANTS FOR 1851, is just published, and may be had on application of Mr. R. SILBERRAD, 5, Harp-lane, Great Tower-street, London.

WIDNALL AND DAVIS respectfully announce that their two first rate FANCY DAHLIAS, will be ready to send out, the first week in May.

ADMIRATION (Widnall and Davis) rich purplish crimson, tipped with pearly white, centre well up, very symmetrical and constant, 3 ft., 7s. 6d.

APPROBATION (Widnall and Davis) rich mellow orange crimson, tipped with beautiful creamy buff, a very desirable first class flower, 4 ft., 7s. 6d.

They can also execute the following in good plants:—

FUCHSIA nigricans, } Linden's two magnificent Peruvian
" venusta } species, figured in the Flore des Serres, in Dec., 1849, 3s. 6d. each.

VERONICA ANDERSONII, a superb plant for bedding or Greenhouse culture, with large spikes of white flowers, delicately tinged with blue. Figured in Paxton's and Lindley's Flower Garden, for March, 1s. 6d. each, or 12s. per dozen.

Packets of Chater's superb Hollyhock Seed, by post, at 2s. 6d. each.

The present is the time for sowing.

WIDNALL and DAVIS's general list of Dahlias, Pelargoniums, Chrysanthemums, and soft-wooded plants, can be had on application.—Grantchester Nurseries, April 12.

FORGET-ME-NOT.

MYOSOTIS AZUREA GRANDIFLORA.—This unique variety stands unrivalled for its colour and habit, being very superior to the older sorts of that lovely flower, the Forget-me-not; it also possesses the following good qualities over them: The flowers are much larger, perfectly hardy, and will stand for many years in the same situation; it is a lively blue, and grows about 9 inches high, producing hundreds of blooms on the plant at a time; flowering from June till October, it will be found very useful for planting on rockwork, making a bed, or forming edgings; being a colour much wished for, as there is a great deficiency of dwarf blue flowers for autumn blooming. The Seed of the above is now ready to be sent out, at 2s. 6d per packet. Also the following varieties of Flower Seeds can still be had: Hollyhock Seed, 2s. 6d. per packet of 150 seeds; German Aster Seed, 1s. per packet; Sweet-William Seed, 1s. per packet; Antirrhinum Seed, 1s. per packet; and also the other varieties of Seeds named in the former Advertisement in this Paper on the 5th of April. The whole or any part of the above sent postage and package free. A remittance must accompany the order, either in cash or penny postage stamps, for the amount.

Sold by EDWARD FILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath.

VALUABLE VEGETABLES.—CAULIFLOWERS.—Myatt's improved early, much earlier than the old varieties, more compact and heavier, considered by the raiser as most desirable, quantity very limited, 1s. packets.

BRUSSELS SPROUTS, improved variety, direct from Brussels; 1s. per oz, 6d. per packet.

CABBAGE, MITCHELL'S ENFIELD.—This has been tried at the Horticultural Society's Garden, and pronounced one of the best; 1s. per oz, 6d. per packet.

CABBAGE, CHAPPEL'S COLEWORT, excellent for Winter Greens, 6d. per oz.

CARROT, ST. JAMES', one of the best for small gardens, and shallow or heavy soils; 3d. per oz.

CELERY, COLES' SUPERB RED, very extensively grown last season, and pronounced first-rate; 1s. per oz., 6d. per packet.

LETTUCE, VICTORIA CABBAGE, but little known, but one of the handsomest grown, and which no gentleman's garden should be without.

DUNCAN HAIRS, in offering the above selection from his general List, begs to inform his friends that he warrants them to be as described.

109, St. Martin's-lane, Charing Cross, London.

THE FLOWER OF THE DAY—VARIEGATED SCARLET GERANIUM.—This elegant plant is of vigorous habit, the foliage bright green, with a broad silver margin. The flowers light scarlet in large trusses, like Globe Compactum. JOHN and CHARLES LEE are selling extra strong plants, at 10s. 6d each. Small plants for bedding on the 1st of June, 6s. per dozen.—Nursery and Seed Establishment, Hammersmith, near London.

WARRANTED UNEQUALLED.

ROBERT WHIBLEY is now supplying Selections in Pots, and by Post, from his select Collection of FUCHSIAS. Twelve Varieties, new and distinct, of last year, 10s. 6d. cash. See List containing a great variety of choice new Plants for one stamp.

SELECTED NEW SCARLET GERANIUMS.

Flower of the Day, 3s. 6d. each; the following, at 12s. per dozen, purchaser's selection; if left to R. W., good sorts, 6s to 9s.; Brompton Hero, Cornet, Cottage Maid, Compacta, Cerise Unique, Eclipse, Exquisite, Frogmore improved, Fireball, Globe superb, Gem of Scarlets, Honeymoon, Huntsman, Hydrangæflora, Ibraham Pacha, Ivery's scarlet, Jenny Lind Lord Bacon, Lady Agnes Byng, Mrs. Maylor, Magnum Bonum, Prince of Wales, Priz-fighter, Pink Nosegay, Phenomenon, Pink Pet, Punch, Perpetual, Queen, Queen of Summer, Royalist, Shrubland Superb, Symmetry, Smith's Scarlet, Tom Thumb, Ditto Master, Ditto improved, Tam O'Shanter, Trentham Scarlet.—The Trade supplied.—Nursery, Kennington, London.

# The Gardeners' Chronicle.

INTO the agricultural division of this Paper, at p. 169 of the present year, an article found its way from the pen of an occasional contributor, to which a moment's leisure enables us now to advert.

The object of the writer was to show that the price of GUANO is higher than the public can afford to pay, and that this price is wholly owing to the operations of the importers. In order to support this view, the writer has fallen into some errors, unintentional no doubt, but such as he might have easily avoided. He first asserts that the price charged by the importers is 10*l.* a ton; but a glance at the weekly advertisements in our columns would have shown him that the importers' price is 9*l.* 5*s.*, subject to a discount of 2½ per cent, which brings the real charge to 9*l.* 0*s.* 6*d.* He then names Messrs. GIBBS, BRIGHT, and Co. as the importers, in which he is wrong again; the advertisements would have informed him that the sole agents of the Peruvian Government are Messrs. ANTONY GIBBS and SONS, of London.

The allegation that the price is higher than the consumer can afford to pay is neither confirmed by the sale, nor by a comparison of the value of guano with that of other forms of manure. The sale during the last year has, we understand, exceeded that of any previous year by about 18,000 tons; and Mr. WAY has demonstrated in the Journal of the Agricultural Society that the money value of a ton of good Peruvian guano was, in 1849, 12*l.* 2*s.* 5*d.*; the ammonia being worth 9*l.* 14*s.*, the phosphate of lime 1*l.* 13*s.* 9*d.*, and the potash 14*s.* 8*d.* According to this calculation, the buyer of a ton of Peruvian guano at 9*l.* 0*s.* 6*d.* actually pays 3*l.* 1*s.* 11*d.* less than he would have to pay for the raw materials of which it is composed.

That it would be much better for the consumer if pure Peruvian guano could be sold cheaper, nobody will deny. So it would be better if ammonia were cheaper, and phosphates and salts of potash, and farm-yard manure, and wine, sugar, tea, and broad cloth. But the price at which the vendor can sell these articles depends upon the price he pays for them, adding a fair mercantile profit. If he adds more his trade disappears. The guano trade would disappear if the consumer could obtain the ingredients of which the substance consists at a lower price than that of guano; and he undoubtedly would procure them at a lower price if the manufacturers could afford it; for all these articles are made in a free market, open to the utmost possible competition.

The truth is, that the selling price of guano does not depend, as is assumed, upon the will of the English importer, but upon that of the Peruvian Government, which, perhaps, would be consulting its own interest by fixing a still lower price, and thus increasing the consumption of the article and augmenting its revenue. We must bear in mind, however, that there can scarcely be room for any considerable reduction; for if we deduct from the 9*l.* 0*s.* 6*d.*, 3*l.* 10*s.* to 4*l.*, which, we understand, the importers are now paying for freight, and 1*l.* 10*s.*, which, we suppose, may be calculated for shipping charges, commissions, and other expenses, on both sides of the water, there will only remain to the Peruvian Government a net proceeds of about 4*l.*, of which it is understood that they apply half to the payment of their English bondholders. We would at the same time remind our agricultural friends, that to secure constant supplies of guano the price must be sufficient to leave something as a present revenue to the country which has the good fortune to possess this invaluable manure.

THE utmost editorial vigilance is insufficient to prevent the circulation of misrepresentation; and therefore, in calling attention to the following letter, inserted in the *Times* of April 10, we impute no blame or want of caution to the conductors of that great newspaper.

A person signing himself "Kewensis," and dating his letter from Kew, obtained admission into the columns of the *Times* for the following letter.

"For nine months of the year Kew Gardens are not accessible to the public. At the present season, when admission would be particularly acceptable, it is denied, and if the gardens be not opened prior to 24th of June (this being the practice), many foreigners will lose the opportunity of visiting one of the most beautiful spots in the neighbourhood of the metropolis. If the gardens were opened this year simultaneously with the Great Exhibition, viz., the 1st of May, and opened at 10 or 11 o'clock in the morning every day in the week (not as hitherto, from 1 o'clock till sunset on Sundays and Thursdays only), a great advantage would result to the public."

If the signature to this letter means anything, it means that the writer lives at Kew; and in that case, his statements are wholly inexcusable; for he must have known that they are misrepresentations from first to last. Kew Gardens inaccessible to the public for nine months of the year! why they are open every day, from 1 o'clock to dark in winter, and nominally till 6 in summer, but really to a later hour, for visitors are not turned out. As to opening the gardens at 10 or 11 in the morning to crowds of idlers, we should like to hear from this writer how, or when, under such circumstances, he imagines the business of the garden, and the indispensable attention to the plants, is to be secured; to say nothing of the workmen obtaining their meals.

But perhaps "Kewensis," not knowing what he writes about, may not mean what he says; and under the name of Kew Gardens, he may possibly intend to designate the old game cover and park, commonly called the Pleasure-ground, adjoining Kew Gardens. This place, consisting of 175 acres, has just been converted into an arboretum planted with young trees, and is not, as yet, the kind of place where all the wanderers from London should be permitted to spend their leisure. Some 20 years hence, when the young plants have grown into trees, and are beyond the reach of mischief, the space might be thrown open unreservedly; but no prudent man would recommend it to be done at present.

Lord SEYMOUR has on no occasion shown himself unwilling to consult the public convenience; and we entertain no doubt that he will, without the assistance of "Kewensis," take whatever measures the peculiar circumstances of the present year may render advisable. But officers of the Crown have to consult something more than the grumbling or caprice of gentlemen who think that free access of the public daily to the finest garden in Europe, containing the best English Museum of its kind, and occupying an area of 76 acres, is insufficient; they have to resist ignorant impatience, and to see that public interests are not sacrificed to the private objects of those whose horizon does not extend beyond the limits of their own convenience. And we shall be much surprised if either the Commissioners of Woods and Forests, or Sir W. HOOKER, sanction the measures recommended by the writer of the letter in question.

THAT the ROOTS of PLANTS have a certain power of selection is now well known; it was most distinctly proved by the old experiments of SAUSSURE; he immersed the roots of growing plants in water containing an equal weight of two different saline substances, and when the plants had sucked up and absorbed half the water, he took them out, evaporated the remaining water, and ascertained how much of the two salts remained; this, of course, indicated the quantity which the plants had absorbed. It was quite plain that, if the roots merely absorbed the different saline solutions thus presented to them indifferently, an equal quantity of each salt would be absorbed, when two were dissolved together; and consequently an equal quantity of each would be left on evaporating the remainder of the solution. This, however, was not the case, for it was found that the quantity of salt absorbed varied in a most remarkable manner; not only did similar plants absorb very different quantities of various salts, in absorbing equal bulks of solution of the same strength; but, when a solution containing two different salts were employed, the plant took up very variable pro-

portions of the two salts. These experiments are certainly very interesting, and deserve to be carefully repeated and extended; because from the small number of salts which were employed, it is difficult to attempt to draw any general conclusion from them. As far, however, as they go, they serve to indicate that the salts of the alkalies are more readily absorbed than those of the earths, such as lime; and also that the compounds containing muriatic acid are more freely taken up than those containing other acids.

In experiments of this sort it is necessary to select such salts as cannot in any way react chemically on each other, giving rise to what is termed double decomposition, as in that case the results of necessity become complicated, and of comparatively little value. In some of the cases described by SAUSSURE, this cannot possibly take place; thus, for example, he found that when a solution containing equal parts of muriate of soda and sulphate of soda was used, the plant, in the time that it absorbed seven grains of the sulphate, had taken up 20 grains (or nearly three times as much) of the muriate. This is a remarkable fact; because neither whilst in the state of solution, nor yet after they had been absorbed by the roots, could these two salts in any way act on each other; it is plain, therefore, that the difference, which is considerable enough, must be chiefly traced to the muriatic acid. The same general result was also obtained on comparing together the muriate and sulphate of potash; whilst the roots absorbed 10 grains of the latter salt, they took up 17 of the former; in this case also, therefore, the effect of the muriatic acid was that of causing the plant to take up more of the alkaline base. The interest of these experiments is still further increased by the fact that when the points of the roots were cut off, the effect in question ceased altogether, the distinction between the two salts no longer existed, and they were then both absorbed in precisely the same proportion. These facts have been attempted to be explained in the supposition that the various saline substances render the water more or less viscid, or at least to a slight degree impair its fluidity; an explanation certainly not altogether satisfactory, because if such were the case, the same effect would be observed on filtering saline solutions through ordinary filters, made of fine blotting paper, whilst, in reality, no such differences can be discovered.

The absorption of saline substances by plants varies considerably even between individual plants of the same species, evidently depending on some special condition, not indicated by the circumstances of the experiment; but it likewise varies very greatly between plants belonging to different species. The observations of SAUSSURE, and also the more recent experiments of DAUBENY, seem to show pretty clearly that this power of absorption is quite independent of the vegetation of the plant, and that it does not follow, either that the substance most easily absorbed is that which is most beneficial to the plant, so that the latter will retain in its system that substance which it most freely absorbs. In fact it comes to this, that though plants absorb various substances with very different degrees of facility, yet it does not appear that they do so in any relation to the value of those substances as nutriment, or in proportion to the benefit which they are able to derive from them. The experiments of MACAIRE on the so-called excretions of plants, were considered to prove that plants have a power of rejection, or the means of throwing off by the roots, hurtful and unnecessary substances; but this effect is evidently quite distinct from the mere power of absorption.

The true nature of the conditions most favourable to absorption, and the exact principles which regulate that absorption, are in fact still to be investigated. Practically, however, though under ordinary circumstances the roots of a plant seem to absorb the substances presented to them in proportion to their chemical and physical properties, rather than in the ratio of their value as food; yet, as Mr. KNIGHT has well shown, there is another matter to be taken into consideration as bearing importantly on the absorption of useful or hurtful matters by plants, namely, the development and growth of the roots. That excellent observer found that when seeds were sown so that the young roots might either develop in rich or in poor soil, they were always most healthy and abundant in the former, and that when roots were put forth in a poor soil, but in the immediate neighbourhood of a fertile one, they always grew in the direction of the good soil, and increased rapidly as soon as they entered it. It is hardly necessary to remark that there are limits to this power, and that the roots of plants continue to grow and develop, even though by so doing they pass from a good soil into one which is absolutely poisonous. Every one must have often seen instances of plants growing in a good superficial soil, which flourished so long as their roots were in the good soil, but which when they had increased to a certain size, and had therefore pushed their roots beyond the limits of that soil, immediately became unhealthy, and soon died. Direct experiments, also, in which various poisonous matters have been imbedded in the soil, in the immediate course of the roots, have proved the same fact; the roots continued to grow, just as though the poisons were not placed before them, and did not cease growing until they absolutely came in contact with the deleterious matter.

The consideration of these facts, aided by further experiments, might probably lead to valuable information respecting the use of certain manures, and the effects of particular substances, such as the superphosphate of lime, on the formation of roots. If plants absorb the various substances presented to them, whether hurtful or beneficial to their growth, with such different degrees of facility, and if particular substances in the first instance act by causing an increased development of roots, it becomes a question of some interest to determine what relation exists between the absorption of different forms of the same substance, all of which are more or less favourable to the growth of plants, and the effects produced on the formation of roots. Whether, for example, that salt of phosphoric acid which is most soluble in water is also the one most abundantly absorbed by plants; and further, whether the compound of that acid most freely taken up, produces the greatest effects in increasing the formation of roots. The facts recently brought to light with regard to the absorption of ammonia, and the decomposition of the various salts of that substance by the soil, seem to explain why those salts for the most part act in so uniform a manner on growing plants, very little more benefit being produced by the use of the phosphate or nitrate as manure, than by that of the sulphate or muriate. We have long been convinced, from the results of a great number of experiments on the use of saline manures, that the salts employed in many cases undergo important chemical changes, either in the soil or in the organs of the plants themselves, after the absorption of the salts.

The presence of alkaline nitrates in plants will serve as an illustration of the matter to which we refer. It is well known that under certain circumstances, a considerable number of plants contain a notable quantity of nitre, which may not only be detected in them by chemical tests, but likewise is plainly evident on burning the dry leaves; they hiss and sparkle like touch-paper. This is the case with a great number of plants, but Tobacco, Lettuce, Sunflowers, Borage, Carrot, and Potato are generally referred to; they do not, however, always contain nitre, and the exact kind of soil, or other conditions requisite, are not well known. Even in the same soil, and growing side by side, two similar plants may be gathered, the one containing nitre, the other none. Even stronger cases still are on record, for it has been found that plants purposely manured with nitre contained none of that salt, though there is little doubt that they must have absorbed a portion of it from the surrounding soil; whilst other plants which were manured with some salt containing no nitric acid, such as common salt, or sulphate of soda, did contain nitric acid. Perhaps the most curious case of all, is the presence of nitrates in plants which have been manured with sulphate or muriate of ammonia; in such instances, the nitric acid must be derived from the oxidation of the ammonia, probably in the soil previous to its absorption by the plants, but possibly after it has been so absorbed. Whether or not this may be the case, it is pretty certain that the salt of ammonia must have been previously decomposed, either by the action of lime or some other powerful base, which took from it the sulphuric or muriatic acid.

---

WE understand that some of the growers of PELARGONIUMS complain that the prizes offered by the Horticultural Society are not sufficient to defray their expenses. Upon this we may remark that the prizes this year are the same as were offered last year; and but one person then complained of the amount. The only difference is that the number of plants to be shown this year in A and B is 12 and 9 instead of 6.

We should not have imagined that this would have made any material addition to the cost of transport, and the small addition would, we should have supposed, have been more than compensated for by the new regulation, under which nurserymen and private growers exhibit independently of each other. At all events the Committee did not intend to place the growers in a worse position. Quite the contrary. We have therefore no difficulty in stating that the winners of prizes will, in addition to the medals they may gain, be paid any reasonable expense to which they may be put beyond what was incurred in former years.

## FOREIGN GARDEN GLEANINGS.

IMPERIAL PLEASURE GARDENS.—The imperial palaces or pleasure gardens which are for the most part at some distance from St. Petersburgh, are by no means less magnificent or worthy of attention than those in the capital itself. Two of these residences, viz., those of Tsarskoe-Sélo and Pawlowski, deserve especial notice. A railroad, one of the oldest in Europe, and for which the public are indebted to Count Alexis Bobrinski, connects these palaces with the capital. The first, called by a name signifying the *czar's village*, is situate eight miles from St. Petersburgh, on the road to Moscow. On the way there is a small gothic palace, noted for its fine collection of portraits of the families who reigned in Europe, in the year 1775.

Tsarskoe-Sélo can be seen from afar, in consequence of its magnificent golden dome. The palace was built by Catharine, embellished by Elizabeth, and is remarkable for its immense size and the richness of its architecture; the most precious substances, and gold in particular, have been lavishly employed in its decoration; in the interior, a magnificent marble staircase leads to three halls, ornamented respectively with mother of pearl, amber, and Chincse lac.

The park and gardens, which were replanted in the English style, by the celebrated John Bush, in 1775 to 1789, are of vast extent, and exceedingly picturesque. The visitor is continually surprised with something new; bridges of wood and of marble, artificial lakes, surrounding Russian mountains, Turkish mosques, ruins, pyramids, obelisks, a Chinese village, a Swiss farm, with a fine collection of horned animals from the Tyrol, and other objects of a similar sort, are scattered throughout the grounds, with a profusion that is truly imperial; and, as if to render the place still more complete, there is a little town to commemorate the conquest of Taurida, and a charming temple filled with invaluable statues.

The houses in the kitchen garden occupy about 3000 yards of ground covered with fruit trees, which are fine, but not yet thoroughly acclimatised; these trees are all covered over in the bad season.

The flower garden, separated from the pleasure grounds by the walk which leads to the palace is irregular in form; it is under the care of M. Markevark, a pupil of M. Silvin, a French gardener, celebrated for his Roses. At the time of our visit, the collection of flowers was fine and beautiful.

The houses are lined with *Fuchsias* and *Plumbago capensis*; the latter plant, with its numerous and beautiful blue flowers, has a remarkably fine effect; M. Markevark uses it for decorating the palace; before the flowers are expanded, 10 or 12 stems are cut and placed in a pot, where they take root, and in less than a fortnight there is a beautiful head of flowers.

The largest plants in the greenhouses are the *Laurus nobilis*, the stem and crown of which will well bear comparison with the best Orange trees at Versailles; *Ixora*, the rival of *Hydrangea*, for its brilliant scarlet colour, and *Gardenia*, which is grown in the open earth; all these plants attain a considerable size.

Lastly, we may remark, as deserving notice, the collection of old Roses, *en quenouille*, four or five yards in height, and worked for the most part by cleft grafting, close to the ground, and on stocks a little softer than our wild stocks. *Masson's Report.*

## BRITISH SONG BIRDS.

(CAGE BIRDS, No. 10.)

No. XXVI.—When you remove your nestlings, for the purpose of bringing them up by hand, mind and take the nest with them. They are used to it; and for the short time they will remain in it (being eight days old when you take them away), it will answer well enough for your purpose. Remember and be kind to your young charge; for you stand towards these innocents *in loco parentis*.

Wherever there are birds, *there* most assuredly will be mice. It is next to an impossibility to keep these pests out, and they poison all they touch. Examine, therefore, very narrowly, every corner of the room; and whenever you see a hole, nail over it a piece of tin or zinc. So cunning are these vermin that they conceal themselves in the most unsuspected situations. I have actually found them secreted in the food "hoppers." They have raised the lid and artfully ensconced themselves behind the seed until my back was turned! I hardly need tell my readers *what* was their fate when so discovered. Suffice it to say that they were "tried," and that I myself personated the witnesses, judge, jury, and—executioner.

We will now turn our attention to the "breeding" of canaries in *Cages*. This is a study, not only "amusing," so to speak, but very instructive,—for young ladies who are in their teens in particular. From birds as from the "ant," we may learn many practical lessons of wisdom; indeed the minutest insect, as well as the smallest animal, affords much cause for admiration, and teaches us, if we be apt scholars, much worth the knowing. Full many a time and oft has an attentive consideration of the domestic economy of animals, *forced* me to "think;" and such thoughts have never failed to prove profitable.

In a pair of canaries, well matched, you will find much to admire, from the very time of their nuptials. There will be between them only one heart, one mind, one voice. No pulling two ways, no dissentions, no quarrels; at all events there will be no sulkiness, or bearing of malice. The sun never goes down upon their wrath. A dark cloud one moment, is followed by a

streak of cœrulean blue the next; and so on till the advent of their infant progeny. And let me here remark, to the honour of the "Papa apparent," that he will be found fairly and affectionately to have shared with his *cara sposa* all the onerous duties inseparable from incubation.

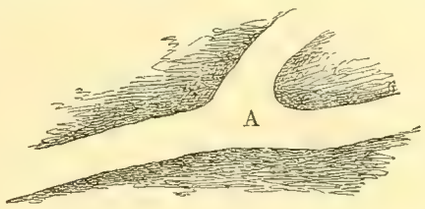
Then again must we carefully remark the tenderness and anxiety of the parents, and the obedience of their children. Not one note is uttered by the former without having some "meaning" in it; and this "meaning" is instinctively recognised by the nestlings, who never once venture to quit their cradles until called forth to see the world. Then are they carefully fed, protected, and warned, until they "come of age." *Here* Nature halts. It is now time that they should see about getting *their own* livelihood. Another lesson for us!

In choosing your birds an appropriate dwelling, study their happiness in every possible respect; and be sure their cages are manufactured of Mahogany; they not only last longer than any others, but they let their inmates live in comfort and cleanliness. Vermin are, comparatively speaking, seldom found in Mahogany cages.

The proper dimensions for a breeding cage are as follows:—Length, 2 feet 4 inches; depth, 12 inches; height, 20 inches. The top and sides should be of wood, the front of strong tin wire. Three or four perches should run across the cage, and a little chamber, or rather one large chamber divided into two, should be made immediately under the top of the cage, to hold the nest boxes. In the front of these compartments should be circular holes, sufficiently large to give the birds ingress and egress to their nests. In these divisions they will build, and also rear their young. To enable you, when occasion requires, to get access to these nest boxes, have square doors made in the side of the cage, opening outward. You can then quietly make your observations, and avoid disturbing your birds. In the front of the cage, there should be two large tin pans inserted, one on either side, to hold the seed; also a circular hole in the centre, to admit the birds' heads while drinking. A receptacle of tin should be provided to hold the water, suspended by bent wires. To enable your birds to get at their food the more readily, a long narrow perch should run immediately behind these tins, from one end of the cage to the other. Let the inside be painted thrice in oil, white.

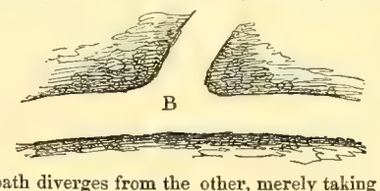
Some people assist their birds in the construction of their nests; and I see no objection to it. Let the two nest boxes be half filled with the building material; their labours will then be considerably lightened. The hen will soon model a nest to her mind. The nest bags must be well scalded previous to use, as I have before remarked, in order to kill the indwelling vermin. Hang them in front of the cage, outside; and carefully collect any building material that may be found dropped inside the cage. Extreme cleanliness must be observed, and in the tray there must be kept an abundant supply of small, red gravel, mixed with a little powdered chalk.

Before turning your birds into a breeding cage, see that they be well "paired." When you have selected such colours as you approve, put the male into one cage, and the hen into another. Hang them up *dos à dos;* just so as the eye of each can come into contact, through the hole made to admit the nail. This, while it effectually works out the intended purpose, will keep you in a constant state of merriment. The antics of the birds, and the vain schemes they concoct to break out of prison, are exceedingly diverting. You will often perceive their heads, or one-half of their heads, protruded through the hole; their one, unceasing aim, being that of "casting sheeps'-eyes" at each other. Then, listen to their voices! What persuasive eloquence falls from the oily tongue of the male! What affectionate tenderness lies in the languishing responsive l-i-s-t-h-p of the bride elect! Thus are reciprocated vows of eternal fidelity; which it gives us pleasure to record, are, for the most part, preserved inviolate. A week's dalliance brings matters to a crisis. An explanation is asked, and given. The question is popped; the lover accepted; romantic sentimentality gives way to the sterner realities of every-day life; and the "sublime" sinks at once into the "ridiculous." It is said to be but "one step." In sober truth—may I say it?—it is a STEEP ONE! *William Kidd, New Road, Hammersmith.*



## FLOWER-GARDEN WALKS.

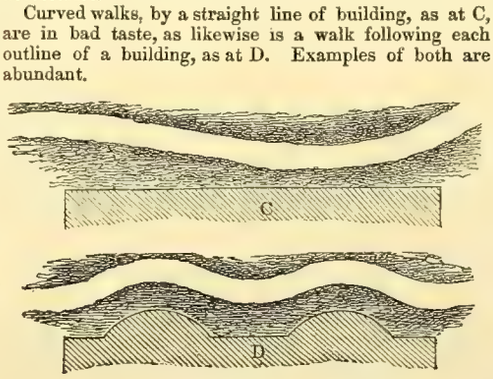
In no part of the arrangement of ordinary flower-gardens is there greater violation of good taste than in the disposition and formation of the walks. Graceless and unmeaning curves, fine lawns spoiled with strips of fiery gravel,* and unsightly junctures, and surfaces inconveniently convex, are amongst the incongruities one constantly meets with, especially in the gardens of villa residences.



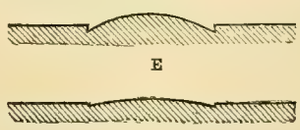
If a good lawn is the pride of an English garden, a tastefully disposed and well-formed walk is only second in importance. The beauty of the one only exhibits more glaringly the defects of the other. In the majority of instances walks are too narrow. If you have a walk, let it be at once convenient and in keeping with the other parts of the garden. However well arranged the lawn and shrubberies may be, a narrow, paltry walk gives an air of meanness to the whole garden.

Every deviation in a line of walk should result from some *visible* cause. The contortions so often seen are in the worst possible taste, or rather in no taste at all. They speak as plainly as possible to the fact that the designer executed the stereotyped curve from imitation only, and not from an appreciation of the principle of arrangement. To avoid some disagreeable prospects, to gain an interesting view, to reach some pleasing object in the grounds, are some of the reasons for curves in a line of walk. Curve after curve of walk on an open space of lawn, without purpose or object, cannot be too severely deprecated.

The junction of walks should be at as great an angle as possible. Thin strips of Grass between diverging walks, like narrow points in a shrubbery, are highly objectionable, and should ever be obviated, if practicable. To avoid the narrow strip of Grass, in the case of walks, an expedient, as represented in the sketch A, is often



resorted to; but from the amount of gravel thus rendered visible, the practice is not to be recommended. Large surfaces of gravel thus made prominent are offensive to the eye, and tend to curtail in appearance the extent of a garden; and besides, each walk should be definite in its direction, which in such arrangements as that sketched is not the case. One is as much a main walk as the other. Rather, as at B, indicate that



one path diverges from the other, merely taking off the angles of the turf formed by the juncture. The effect of the first example is bad on paper, but infinitely worse on a garden lawn. Of course in a carriage drive or other road more relative scope for turning must be allowed than is permitted in a garden walk.

More than one curve should not be seen from the same point, looking in the same direction, as such an arrangement is not pleasing, and you see too much of the garden at once. It detracts from the interest. Of course, as a general rule, no pleasure-ground walk should be perfectly straight, but exceptions will sometimes occur. Supposing them unavoidable or necessary, good taste will furnish the necessary and appropriate accessories.

Curved walks, by a straight line of building, as at C, are in bad taste, as likewise is a walk following each outline of a building, as at D. Examples of both are abundant.

The surface of walks should be only slightly elevated, and not, as is often seen, perfectly convex—so much so, as to render them inconvenient for walking on; *merely* raised in the centre is all that is necessary. The depression below the Grass margin should be but slight, and the elevation only in a corresponding ratio. A couple of inches of bare earth at the sides of a walk, constantly kept bare with the edging-iron, cannot be said to add to its beauty. I would banish the edging-iron from the flower-garden walk, and never allow a "raw"-edge to be seen. The beauty of a walk so treated is not to be compared with one otherwise dealt with. At the sketch E is represented the section of a walk to be avoided; at

F, one to retain. The effect of the two in reality will not bear comparison, to say nothing of the comfort in walking on the flatter surface, the primary object in the formation of a walk. *G. L.*

## TRADE MEMORANDA.

Mr. George Boden, of Peel-place, Hulme, near Manchester, orders two tons of bone-dust, &c., to be sent from Plymouth to Manchester. As the bankers to whom he refers have not the honour of his acquaintance, perhaps some correspondent may know the gentleman.

## Home Correspondence.

*Forcing Asparagus.*—The increased demand for forced Asparagus, that has taken place of late years, has rendered it necessary on the part of gardeners to provide means for the production of the additional supply; and this can only be accomplished, either by having a large stock of plants, to take up for forcing, or by making permanent beds, with means of heating them. Now, conceiving it to be the duty of every gardener to produce his crops at the smallest cost, I think it worth inquiry which of the methods usually practised is most economical, and produces the largest quantity at the least possible expense and labour. With this object in view I adopted the taking-up system at Stoke Rochford, my calculation being that I would have to take up about 80 superficial yards annually, and that the beds would have to stand 10 or 12 years, from the time of making to that of taking them up for forcing; therefore I made, four years ago, an extra quantity of beds to enable me to have a sufficiency of plants each succeeding year for the purpose of forcing, and I have now only to make good the quantity of ground that is taken up each year. I am not aware that my system of forcing differs much from that employed by other gardeners, but I will venture to describe it, together with the quantity and quality of the produce obtained, which will enable your readers, who are Asparagus growers, to judge of the merits and utility of the taking-up system, by comparing it with the results obtained by other methods. My forcing pit is similar to that of M'Phail's—pigeon holed, and heated entirely with dung linings. I do not put any fermenting material in the interior of the pit, but chamber it over with any old boards, so as to form a vault underneath. The pit is 20 feet long by 5 feet wide, inside measure, and it is divided into five lights. About 2 inches of soil are laid on the boards, on which the Asparagus roots are closely set, and a little soil is thrown amongst them as the work proceeds, and finally the crowns are covered with about 3 inches more of soil, which is all they receive. I plant at different times, in order to regulate the supply required. The first cutting this season was on the 16th Dec., 1850, and I have been cutting regularly since that time. Three of the lights that were first cut have been replanted, and from these I am cutting at the present time. The first five lights produced 2500 heads of Asparagus, or 500 per light, weighing 2 lbs. per 100, which is the average quantity and weight per light I have had during the last four years. The weight does not appear unusual, but it must be remembered that the stalks are all green, as we never cut any white Asparagus, either forced or from the open ground. I generally cut just under the surface, when the shoots are about 5 or 6 inches in length, believing it to be a better practice than cutting deep in the ground, by which a long, white, useless stalk is obtained, very frequently to the injury of the remaining buds, and of no use whatever at table. *J. P., Stoke Rochford.*

*The late Wet March.*—There is no record of so great a quantity of rain as that which fell during the month of March last. At Hyde Vale, Greenwich, 4.02 ins. in depth fell; at the Observatory, above 4 inches; at Lewisham, in Kent, 4¼ inches; at Epping, above 5 inches; and it has been equally great in proportion throughout England. The average quantity for the month of March, nearly the driest month in the year, is 1.71 inches; the quantity, then, has been 2¼ inches in some places in excess. The number of days on which it rained was 18; and on Saturday, the 15th, nearly 1½ inch fell in 15 hours—a circumstance quite unprecedented at this season of the year. March of 1818 was next in wetness, when 3.45 inches in depth fell; the spring altogether was cold, stormy, and very late, and was followed by a very hot, dry summer, which was, however, on the whole very unproductive. *J. Henry Belville, Hyde Vale, Greenwich, April* 14.

*The Deodar.*—Although it is a duty more befitting the vegetable physiologist than the uncultivated sawyer, yet I venture to suggest a reason different from that already given as to the cause of deformity in so many specimens of this otherwise graceful tree. Your complainant's case of an obstinately crooked growth is not a solitary one; I have seen a great many trees in that condition, and at the place from which I write there are several of that distorted class—10 or 12 feet high, with gnarled crooked parts in their stems, where they have been apparently urged into an upright position against their will; while, at the same time, we have some as beautifully formed as it is possible for them to be, with stems clean and straight, with the exception of the graceful bend at the top, like that of a waggoner's whip. Now I am convinced by experience, that neither soil, situation, nor treatment has made this difference, these being all alike here; my theory of the cause is this, (and I offer it but as a theory) that the trees complained of, and which have given rise to so much disappointment, are cuttings, or have been grafts from others, or have in some way been produced under different circumstances from their more upright growing and better shaped brethren. With me the form is altogether different in what I call the true seedling, from what it is in the spuriously produced specimen. The disposition of the branches is not nearly so uniform in the latter as in the former, and instead of the conical outline which the most upright trees usually assume, with a base so close and thick as to hide the ground nearly as far as it stretches; the grafted plant, or that from a cutting, generally bears its branches in a

* Why do so many persons deem a *red* gravel walk an ornament?

desultory undefined manner—and has almost invariably a naked base, and portions of the stem on one side also bare; if the suggestion that I have thrown out be not the cause, then there must be varieties of the tree, as I cannot conceive how the difference can be otherwise accounted for; the case is worth investigating, as it is a matter of great disappointment to find, after a lapse of years, that a tree planted in a conspicuous place is never likely to become anything but a distorted specimen of its kind; and I fear the advice given by your correspondent, of cutting out the present leader and tying in another, would be attended with little success. When a seedling Fir tree loses its leader by accident, it usually produces another, which takes its place, and in a few years, the loss it sustained is made up, and all goes on well; but I hold that there must be some constitutional difference between a seedling plant and a cutting, for producing a leader. The one only restores what by accident it had lost. The other can be hardly expected to create what it never was in possession of. I think much might be said on this subject, but I leave it to your more learned friends to explain the physiology of the matter; in the mean time, I should be glad to know if plants from cuttings have ever been sent out by the trade [no doubt]; the price this tree at first realised gave every encouragement for doing so. It may perhaps strengthen my opinion with those who may be sceptical on the subject when I tell them that of hundreds of Elm trees raised from layers and planted out, not one in ten ever assumed the proper shape of a seedling plant, and some are now 30 years old, deformed and ugly, bearing exactly the same disproportionate resemblance to the true tree that the complained-of Deodars do to the proper ones. With the latter my experience does not carry me back to their origin, but in the case of the Elms I assisted in the manipulation. *An Old Sawyer.*

*Annual Growth of Conifers at Holker, near Ulverston.*—Several statements of the growth of Conifers having lately appeared in your columns, the following table may perhaps be interesting. The height of the different species has been accurately taken every year, usually about the middle of November.

(*a*). Pinus macrophylla and the other long-leaved Mexican species are very liable to injury from high wind. Pinus Russelliana is here much the handsomest. (*b*). Of these two specimens of Abies Webbiana (1) is a seedling, (2) is grafted. The former it will be seen has grown much more rapidly than the latter. It produces annually a number of cones. (*c*). In the catalogue of the Horticultural Society's Journal, Juniperus Bedfordiana, as well as J. Gossainthania, are spoken of as doubtful species, very like J. Virginiana. Here they appear to differ decidedly from it, and from each other. J. Bedfordiana is very hardy. J. Gossainthania rather tender. (*d*). Cupressus macrocarpa seems likely to be one of the finest of the Conifers. There appear to be two varieties of it. The above specimen has its branches spreading horizontally, while in some smaller specimens they are nearly upright. The former is probably the most desirable tree. (*e*). Cupressus thurifera makes very vigorous growth in the summer, but is cut back more or less every winter by frost.*

*Studding Walls.* (See p. 230.)—Perhaps "J. T." will oblige me by stating in what way trees are injured by studs. I have seen them adopted in various parts of the United Kingdom, with success; and, instead of their getting out of use, I am of opinion that they will be universally adopted. I intend, next season, to stud the walls at this place, as I believe the plan to be both economical and efficient. *David.*

*Transplanting in Autumn.*—Having occasion to transplant a good many trees and shrubs, I commenced work last year, in October, and finished in the second week in November. They consisted of Plums, Cherries, Peaches, Apples, Laurels, Elms, Rhododendrons, and many other things. On examining them the other day, I found, without one exception, that they had made roots, varying from 1 to 3 inches in length, and that the buds looked as promising as if the trees had never been disturbed; proving that autumn is the best season for transplanting. *J. Rust, Enfield.*

*Norwood Loam Guano.*—Through the influence of the *Gardeners' Chronicle*, Norwood loam is at a discount. The waggon and three horses are no longer to be seen; they have not been at Norwood for months past. I was told by persons residing there, that the Dutch did not want any more loam; that they did not find it suitable for bulb growing. This was the kind of delusion disseminated about Norwood by the owner of the golden hill; 3*s*. 6*d*. per ton is very different from 30*s*., which was the price charged for the dried loam for mixing with guano. *Dulwich, April* 14.

*Salvia splendens.*—This brilliant member of a beautiful genus was introduced into this country from Mexico some 30 years ago. It is well known, and frequently met with, but more commonly in a neglected state, than receiving that attention which its easy culture, its free flowering at a season when flowers are generally scarce, and its dazzling scarlet colour demand for it. It has occasionally been recommended for out-door flowering; but for this purpose I have not found it worth its room. My attention was first directed to it as a valuable winter plant, from a paper by Mr. Wood, which appeared in a previous volume; but, instead of growing it in winter, as Mr. Wood directed, I imagined that the better plan would be to grow it during summer and autumn, and to try the effect of retarding the blooming; this plan I have found to answer perfectly; and, in my estimation, it is to the conservatory or greenhouse, during the dull months of winter, what scarlet Geraniums are to the parterre in summer—the most attractive of the whole; and I have no hesitation in stating, that attention could not be turned to any neglected plant which would better repay the trouble required in its cultivation than Salvia splendens. I am much pleased with the cheerful effect of its brilliant flower-spikes; they serve, in an eminent degree, to brighten up the dulness which too commonly prevails at the period of the year in which it blooms. Its easy culture points it out as a plant well suited to the circumstances of the amateur; for, although it grows to a size far beyond the convenience of the amateur of small means, when treated as gardeners do who admire it, and who can command room for its full development, yet it may be treated so as to cause it to adapt its size to a very limited space. For this purpose I have found the following treatment suitable. About this time let cuttings of rather firm wood be obtained, and treated like those of the Verbena. If favoured with a gentle bottom-heat, they will soon emit roots, and will commence growing vigorously; they may be stopped once or twice previous to being potted off. Pot into 5-inch pots, and place the plants somewhere near the glass, where they can be kept close and moist. Here they will soon grow rapidly, and must be frequently stopped, so as to make bushy plants. I never allow them to make more than one new joint, until I have obtained as many shoots as I think necessary for the formation of the future bush. As soon as the plants are well established in their pots, shift them into a size larger; 9-inch pots will be sufficient, if large plants are not desired. Towards the end of May, or as soon after that period as your dread of frosts and cold nights has left you, prepare the plants for a place out of doors; if they can be plunged into a sheltered border, exposed to the sun, they will require little further attention except staking, and turning round the pots, to prevent their roots from getting into the soil in which they are plunged. Stopping must, however, be attended to, in order to make dwarf, handsome plants; but this must not be practised after the middle of August, except flowering can be assisted by placing the plants in a close house. About the middle, or latter end of September, remove them to the warm end of a greenhouse or pit, in which they will soon be clothed in the richest scarlet, and will prove well worth the little trouble they have cost you. If they are supplied with manure-water during their flowering season, the latter will be considerably prolonged. I have said nothing about securing a succession of bloom; nevertheless, this ought to be attended to. For this purpose it is necessary to select a portion of the plants, and to pinch out the ends of the shoots just as they are showing flower, which, with the treatment I have recommended, will be early in September. Another portion may be stopped a month, or even two, later; but this must depend upon the treatment which it will then be possible to give them. By means of dividing my plants into three lots, I secure a succession of bloom from October to March; but my second and third lots of plants have the assistance of a close greenhouse during the summer and autumn; or even something warmer, if it is found necessary to bring them into flower at a certain time. The amateur will find a season's practice the best guide in this part of his management. When they done flowering, save one plant, and keep it without water until it shows symptoms of dryness; it may then be cut back, and kept in any spare corner until the time for making cuttings draws near. If it can be placed in a rather warm atmosphere, it will soon furnish abundance of young wood, which must be treated as stated above. In a comfortable place under glass, and with plenty of pot-room, &c., this plant attains the size of five feet high, and as much through; and in November is covered with scarlet from the edge of the pot upwards; but, of course, such large plants would not suit an amateur. This plant would doubtless produce its flowers in the window of a comfortable sitting-room; but for this purpose I do not recommend it, as it is apt to become drawn in the absence of direct solar light. I have said nothing about soil; but it will be found not to be particular in this respect. I use sandy loam and thoroughly decomposed cow-dung, in about equal portions; but if small plants are wanted, use light, poor soil. *J. S.*

*The Turkey Oak.*—My predecessor in the place where I now live cut down many Turkey Oaks, probably of 60 years' growth. He found the timber to be of bad quality, very subject to split in the sun, and to warp or wind. In fact he cut up a good deal of it for firewood. The tanner asserted that the bark was of very inferior quality. In Hampshire I hear that the timber is not reckoned durable. *K. K.*

*In-door versus out-door Temperature.*—The following is a comparison of the heat out of doors, and that under glass, warmed only by the sun; and I hope it may be acceptable at this time, when Mr. Rivers has called attention to the subject of growing fruit trees under glass without fire-heat, in his pamphlet, called "The Orchard House."

| April, 1851. | Temperature. Out-door, in the shade. Lowest. | Out-door, in the shade. Highest. | Lowest under Glass. | Highest under Glass without Fire-heat. |
|---|---|---|---|---|

Under glass, Vines are in blossom; out of doors the buds are swelled but not broken into leaf. Keens' Seedling Strawberry is in full blossom under glass; no appearance approaching to it out of doors. Peach trees are in fruit under glass, while they are only in blossom out of doors.—*C. A. A. Lloyd, Whittington, near Oswestry, 310 feet above the level of the sea.*

*Conifers at Dropmore.*—As I have been often asked what sizes some of the rarer Conifers have attained here, I now forward the heights of a few, together with a list of some of the kinds which are making specimens from grafts and cuttings, equal in appearance to seedling plants. We have the Douglas Fir, Abies Menziesii and Smithiana, Araucaria imbricata, Abies grandis, and the Deodar, from cuttings; and the Deodar, Pinus Lambertiana, and Taxodium sempervirens, grafted. These have all good leaders, and are very handsome. The following are the sizes alluded to:—

| | Height when planted. | Present height. | Girth, 3 feet from the ground. | Extent of branches. | When planted. |
|---|---|---|---|---|---|
| | ft. ins. | ft. ins. | ft. ins. | ft. ins. | |
| Abies Douglasii ... ... | ... | 62 6 | 5 0 | 53 0 | 1829 |
| ,, Smithiana ... ... | ... | 12 0 | 1 6 | 8 0 | 1836 |

## Societies.

Horticultural, *April* 15.—J. R. Gowen, Esq., Treasurer, in the chair. Lady C. Wellesley, Mrs.

Howard, Mrs. Cuff, T. H. Plasket, Esq., H. Cook Esq., R. Sutton, Esq., Capt. Lumley, Mr. Brown, and Mr. Nash, were elected Fellows. Messrs. Veitch produced a great acquisition in the shape of Cantua dependens, a free flowering half-hardy shrub, from Peru, whose introduction into this country has long been a desideratum. Owing to the accounts which had been published of the great beauty of this plant in its native country, much has been expected from it, and it is satisfactory to be able to state that the highest expectations formed of it are likely to be fully realised; for it promises to be not only one of the most charming, but also one of the most useful shrubs that has been introduced to our gardens for years. When it is stated that the flowers are more than twice the size, and far more brilliantly coloured than those of the two-coloured Cantua, some idea of the beauty of a well-bloomed specimen will be obtained; and then it possesses this value, that it is not only a plant suited for the gardens of the wealthy, but also for those of the cottager, where it will be just as much at home as the Fuchsia, requiring, as it does, about the same kind of treatment. A Large Silver Medal was awarded it. The same nurserymen also again sent a cut branch of the Darwin Berberry, in order to show that the flowers keep long in perfection; and along with it a piece of a reported hardy evergreen shrub from Australia.—Mr. G. E. Henderson, of the Wellington-road Nursery, showed seven handsome Gloxinias, and a worthless Besleria named umbrosa.—Messrs. Henderson, of Pine-apple-place, sent two kinds of Grevillea and a Pultenæa, all raised from seeds sent by Mr. Drummond from Swan River, and an example of Oncidium hastatum.—Mrs. Lawrence again produced beautiful cut spikes of the Amherstia nobilis, which has been in flower at Ealing Park for several months past, and which promises to ripen seeds there. It flowers profusely and continuously, and the blossoms appeared to be brighter coloured than those last exhibited.—Three nice heads of Rhododendrons, raised from Kamoon seeds, were shown from the nursery of Messrs. Jackson, of Kingston. One was white, a second blush, and the third, delicate rosy pink.—Mr. Jones, gr. to Sir J. Guest, Bart., received a Certificate of Merit for two Enville Pine-apples, weighing respectively 4 lbs. 4 oz. and 3 lbs. 14 oz.—A dish of Black Hamburgh Grapes were shown from the garden of Sir H. Fleetwood, Bart., of Hill-house, Windsor Forest.—Mr. Higgs, gr. to J. Barchard, Esq., again sent beautiful specimens of Keens' Seedling Strawberry, ripened under rough plate glass, whose value for gardening purposes is now beginning to be generally recognised.—From the Garden of the Society came the charming hardy Heath-like Bryanthus erectus, Lycaste plana, Aspasia Epidendroides, a plant having usually a yellow sickly aspect, but in this instance exhibiting a good green colour, caused, it is presumed, by throwing carbonate of ammonia into the atmosphere of the house in which it grows; also the sweet-scented Trymalium odoratissimum, Boronia tetrandra, the useful spring-flowering Cytisus racemosus, the brilliant Gesnera-flowered Sage, three well cultivated Cinerarias, the new Californian Ceanothus rigidus, which is hardy about London, provided it is not in a situation where it will be thawed and frozen alternately; the white Epacris paludosa, and some other plants, together with cuttings of the following fruit trees: Summer Golden Pippin, a larger Apple than the old Golden Pippin; Eldon Pippin, a middle-sized roundish Apple of good quality, and Beurré Van Mons and Eyewood Pears. The former is a middle-sized pyramidal russeted fruit ripe in November; and the latter is a hardy sort, producing good fruit even in unfavourable seasons. It also ripens in November.

LINNEAN, *Tuesday, April* 15.—ROBERT BROWN, Esq., in the chair. A letter was read from Mr. Kennedy, jun., describing the rock in which vegetable remains had been found at the Cape of Good Hope, and which were exhibited at the last meeting of the Society. Mr. Matchwick exhibited flowering specimens of the Tussack Grass (*Dactylis cæspitosa*) of the Falkland Islands, which had been grown in the Orkney Islands from seed, by Messrs. Lawson, of Edinburgh. The President exhibited three species of Rafflesia, for the purpose of showing that the Rafflesia Patma of Blume, considered by that author as hermaphrodite, is in reality diœcious.

SOUTH DEVON BOTANICAL AND HORTICULTURAL.—We are requested to state that the first exhibition of this newly-formed society will take place on Tuesday, the 20th May, in Rendle's Royal Botanical and Horticultural Gardens, and preparations on an extended and liberal scale are now being made to give every possible *éclat* to the opening day. The gardens will be tastefully decorated during the day, and in the evening will be illuminated with variegated lamps, &c., and the bands will be retained. The Directors of the South Devon Company have determined to run special trains from Exeter, Torquay, and the other principal stations on the line, on this day, at a cheap rate, so as to give the public an opportunity of having a trip to Plymouth to witness the Exhibition, &c.; and in order to give the party ample time to see all the three towns, the return train is not to leave Plymouth till 10 o'clock in the evening.

## Garden Memoranda.

MR. GAINES'S NURSERY, BATTERSEA.—A new span-roofed show house has lately been erected here, and a gayer or a nicer house of plants, at this season of the year, it would be difficult to find. It is 42 feet long, 20 feet wide, and 14 feet high; heated with hot water in 4-inch iron pipes, and fitted round the sides with convenient slate shelves; while in the centre there is a raised bed for Azaleas, Rododendrons, Kalmias, and similar ornamental shrubs. But it is the shelves which more particularly attract the attention of the visitor, exhibiting as they do a dense mass of the most lovely flowering plants, such as could only be furnished by an establishment possessing large resources as this does. Among other things we remarked Cerise Unique Geranium, a bright cherry-coloured favourite kind; Surpasse Napier, Album multiflorum, and Rollisson's Unique, all good forcing Geraniums, and the latter much coveted for its beauty in the flower garden. Roses consisted of Goubault, the common China, and Madame Fabvier; the latter being, according to Mr. Gaines, better suited for early forcing than the crimson China. Empress and Madame Taglioni Cinerarias were present in the shape of specimens at least 2½ feet high and as much through; and grown to this size, and well bloomed, they are both effective and striking. Epacrises contained a deep red variety of coccinea; Azaleas were of the Ghent and Indian kinds, and there was a variety of Tulips, Hyacinths, and other forced bulbs. Among Correæas were the fine variety called Brilliant, which is figured in Beck's "Florist and Garden Miscellany" for 1848, and a straw-coloured sort, named Magnifica, which was stated to have been in flower ever since last September. The centre bed was chiefly filled with Azaleas and Rhododendrons; among the latter were Delicatum, Victoria Regina, Princess Royal, and a pale pink kind, spotted and striped with crimson, called Marie Taglioni. In the least showy end of this house was a beautiful specimen, in a pot, of the handsome Cupressus Goveniana. It was rather more than 5 feet high, and finely formed. The glass with which the house is glazed is 21-oz. sheet, in panes 18 inches long and 9 inches wide; and, on account of the great amount of ventilation which has been provided, both in the roof and at the sides, it is anticipated that no burning will take place. In the "Calceolaria house," were many nice growing examples of Mitraria coccinea, a plant whose brilliant scarlet blossoms will recommend it to every collection, whether it proves hardy or not. The same house also contained the Funereal Cypress (C. Funebris), nearly 3 feet high, forming a handsome pale-green pyramid, whose lateral branches just indicated a slight inclination to droop. A lean-to house, 80 feet in length, contained a stage full of Madame Fabvier, Goubault, Cramoisie superieure, and common China Roses just coming into blossom. As soon as they are forward enough these are sent to Covent Garden market, where they meet with a ready sale; but before they leave the nursery, cuttings are taken off them, struck and "grown on," for the next spring's supply, and in this way a succession of neat flowering plants is constantly kept up. Pelargonium odoratum variegatum is well worthy of notice, on account of its strongly-scented foliage; and in one of the houses we found a stage full of fancy Geraniums, while the centre was occupied by nice small plants of the ordinary kinds. This house was stated to contain nearly 400 varieties. One side of a low span-roofed pit, contiguous to this Geranium house, was full of Cytisus racemosus, a general spring favourite, and the other side contained Cinerarias, than which a more useful market plant hardly exists; for a pinch of seed will produce a houseful of them almost at any time, with very little trouble, and they will all sell, even the poorest of them; but the bright-coloured kinds are sure to go first, though they may not have another good property to recommend them. The Geraniums intended for exhibition are all promising, and some of them are very handsome plants. One of the best of the fancy sorts measured at least 4 feet across. A house of G. album multiflorum, 40 feet long, was just coming beautifully into blossom, and a collection of second early sorts will soon succeed it. A long Azalea house was filled with beautiful examples, which will soon be a mass of flowers, and pits were occupied with this showy plant, as well as with Heliotropes, Pinks, Kalmias, Myrtles, Kalosanths, Geraniums, and other plants, of which large supplies are wanted for the market. Mr. Gaines stated that "few pieces of glass paid him better than his pit of Myrtles," which are continually being cut from to supply "sprigs" for bouquets. Calla æthiopica is also cultivated here for its cut flowers, which are placed in the centre of table bouquets. A variety of Narcissus, called Sol d' Or, raised by Mr. Gaines, is extensively planted in the open ground, where 30 rods of it are kept for cutting from. Some of the hardier kinds of plants are just being turned out into cradles, which are much in request here in the summer time; and hooped over, they form excellent receptacles for the tenderer Conifers in winter, as well as for many other things. Pinuses, especially insignis, Cypresses, Cryptomerias, and other Conifers, may be found here, where we saw some Cryptomerias from cuttings that were undistinguishable, as far as form went, from seedling plants. At one end of the grounds stands a remarkably large Aucuba. It could not be less than 12 feet high, and as much through.

## Miscellaneous.

*Method of Cultivating and Preserving Cauliflower.* By Mr. Pender, Moredun. Read before the Caledonian Horticultural Society, March 6, 1851.—The following is an account of my mode of growing and preserving Cauliflower for winter use. I sow in the first week of May. After the plants are sufficiently strong, I prick them out into a rich bed made up for them, to allow them to make good roots before they are removed to the open ground, which should be done in the first week of July. The ground must be very rich for this planting. After the plants are established, I give them two or three waterings with liquid manure, to stimulate their growth as much as possible; for the stronger they are grown, the finer the heads are. They will begin to show flower in September, and by the middle of October some of them will be fit for use. If the weather at that time be frosty, I go over the plants, gather up the leaves, and tie them together with a bit of bast-matting. I find, by so doing, that the Cauliflower will stand eight or ten degrees of frost without being injured; for when the leaves are closely tied up, the sun's rays do not act upon the flower; but if not covered from the sun, the flower becomes like black soap. I would strongly recommend this mode of tying, particularly to those who may not have accommodation for lifting the plants. I have found the greatest advantage by so doing. I shall now describe my mode of preserving Cauliflower in pits or frames. First I go over the plants which are to be lifted, and remove most of the large outside leaves, allowing, however, as many to remain on as will cover the flower. I then select all the plants that have formed good and compact heads, and lift them, with as much earth at their roots as possible, and have them carefully conveyed to the pits or frames, as the case may be. They are laid in very close together, allowing the flower to be two or three inches above the earth, and as near the glass as possible. The earth which I use is perfectly dry. I do not use water, for I find if the earth be damp the plants soon spoil. If the weather be dry, I never allow the sashes to be on them; but on the approach of rain the sashes are laid on, raised three inches back and front, to give a free circulation of air, which is always kept up unless the frost be very severe. The three Cauliflowers sent by me for exhibition on the 5th of December last, were treated as above. I have now an excellent supply of beautiful Cauliflower every day, and will have for some weeks to come (the date being 16th December). By treating the Cauliflower as above, I find that I can dispense with the earlier sorts of Broccoli, and hence a saving of ground for other purposes. After I have removed the plants which are likely to keep best, I lift those which are more advanced. I cut the roots of these and store them up in a shed, pushing the stems down into damp sand. They keep in this way for a few weeks. The mode of suspending them in sheds by the roots is, in my opinion, a bad one, for it induces the flower to turn black, which looks very bad. I find it to answer the purpose better to suspend them by the leaves, although I can neither recommend the one nor the other mode, for the flower gets dry and loses much of its flavour. *North British Agriculturist.*

*Price and Whitehead's Filter.*—This invention, which is patented, consists of a tube, composed of filter fabrics, drawn up within itself, or of two tubes drawn one within the other, or of a bag drawn up within itself, so as to cause a portion of the syrup, or fluid to be filtered, to pass from the exterior to the interior surface of the inside part of the tube or bag, and the remaining portion of the syrup to pass from the interior to the external surface of the outside part of the filter tube or bag. The filter may be composed of cotton and woollen yarn, carded together, or of cotton warp and woollen weft, or of woollen warp and cotton weft, and is to be woven in a circular loom, and in the same way as quilted goods. *The Architect.*

*Gutta Percha Water-pipe.*—A gutta percha pipe of 2½ inches calibre, and 1000 feet in length, has been laid down for conveying the Croton water to Blackwell's Island, New York. The line extends from the foot of Seventyninth-street to the island, the depth of the water varying from 30 to 7 feet. The engineer first arranged his pipe in one length upon the island, and formed a line of 30 boats, well-manned, across the river. He then gave his order at the commencement of slack water, and the end of the pipe was drawn across the river by men upon the opposite shore, and was taken up by the men in the boats, and 110 anchors, each weighing 32 lbs., were attached to the pipe, being 10 feet apart. By word of command the men in the boats lowered at each point to suit the inequalities in the bed of the river, as ascertained by previous survey. This was all accomplished in 7½ minutes, without accident. *New York Paper.*

## Calendar of Operations.

*(For the ensuing week.)*

PLANT DEPARTMENT.

ORCHIDS.—All those species which are commencing a new growth should be carefully examined and repotted or surfaced, according to their respective requirements. Let the old stuff be picked away as far as possible without injuring the roots. The most suitable material, in the shape of soil for these plants, is half decomposed leaf-mould, which has been sufficiently baked or sweated to destroy everything pertaining to animal life; this should be mixed with one-third its bulk of pure sand, and interspersed and packed with small blocks of turfy peat and sphagnum. Many Orchids do best fastened upon blocks of wood, as the beautiful Phalænopsis, Lælias, Cattleyas, &c. Any wood that is durable will suit them. Perfect drainage is unquestionably of the greatest importance in the cultivation of Orchids; and to secure this, a portion of potsherds should be mixed up with the soil, except in that for Stanhopeas, as the latter protrude their flower stems through the bottoms

of the baskets, which for this genus should be considerably shallower than the hemispherical ones recommended for general purposes, and for these nothing is better than some fibry peat and sphagnum. A liberal supply of water must be given to those plants which are in an active growing state, and a warm moist atmosphere must be retained during the day, in fine weather, especially amongst Vandas and their congeners from the hottest localities, and Dendrobes, which are in a growing state. Shading in bright strong sunshine is indispensable, but the abuse of this is as common as the use of it. The canvas should be so arranged that it can be removed or applied in a few moments; as the difficulties of covering or uncovering, in many instances, prevent the necessary attention to this matter. CONSERVATORY.—Climbers should now have a portion of their shoots pruned hard, to produce growths for late autumn flowering. The training of the young shoots should have regular attention, that they may at all times look neat; on the other hand, carefully avoiding the stiff formal appearance which is produced by tying in the shoots to their extremities. If the house is sufficiently lofty, climbers look most graceful when they are allowed to hang down from the rafters in natural festoons. Plants in conservatory borders (whether climbers or otherwise), which have been planted in former years, should have as much of the old exhausted soil removed as can be done without materially injuring the roots, and the space filled up again with fresh compost; and, at the same time, if any alteration in their arrangement is desirable, it should be made. On a careful scrutiny of the plants, many will present themselves to notice, which will form greater objects of attraction, if planted out, than they will if confined in pots. In making a selection for this purpose, those sorts should be chosen which are remarkable either for the beauty of their flowers, for continuing a long time in bloom, or for their elegant and ornamental appearance in habit or foliage. Let the soil for these plants consist of roughly-chopped turves of loam or peat, with an admixture of richer materials, according to their special requirements; but let the surface be covered with finer soil, for neatness sake. Camellias planted out in conservatory borders are much improved by having a portion of the old soil removed, and new supplied every spring, after the flowering is over. Abundance of water should also be given them while they are growing. As the season advances, heat and moisture may be more liberally supplied to tropical plants, increasing gradually in proportion to the growing power of the sun's rays, but in all cases avoiding a high night temperature; 60° being quite sufficient for those which are growing most actively. The necessary night temperature must be principally obtained by closing early, and so retaining the heat derived from the sun; and when fires are required, they must not be so strong as to render it necessary to admit currents of cold air. This must be used with more care than when the plants were in a dormant state, for the admission of a current of cold air during the development of the young growth will frequently give it a check, and so injure the tender foliage as to spoil the future appearance of the plant; a cold current of this description is very different from the moderate circulation of the air which is necessary in all plant-houses. Select some of the strongest young plants of Carnations and Picotees, and pot them in soil consisting of three-fourths loam which has been charred for the purpose of destroying wireworms and other insects, and one-fourth thoroughly decomposed cow manure. During the summer, the plants should be plunged in a bed of coal-ashes, and watered occasionally with clear liquid manure, and all flowering stems should be picked out. After the end of August, the stems should be carefully tied up as they make their appearance; and towards the end of October, the plants should be placed near the glass in a frame or on the front of a greenhouse stage, where they will continue to flower a long time, and be much admired. Seedlings grown in pots and very liberally treated, will rarely fail to flower through the winter.

### FORCING DEPARTMENT.

PINERIES.—A steady heat, especially among fruiting plants, is very essential, as they should all now be making a rapid progress. Where the bottom-heat is supplied by fermenting material, it should be carefully examined; and, on the first indication of a decline, the old tan should be loosened up, and surfaced with a few inches of fresh. The sun being now so powerful an auxiliary in keeping up the heat, it will not so frequently be necessary to renew the entire bed; but if the latter course seems likely to be required soon, it should be done the first time any of the plants are removed for potting, or other purposes, that they may be disturbed as little as possible during the summer. As the season advances, it will be necessary to shade with thin bunting during strong sunshine; but, at present, it should be used very cautiously. VINERIES.—In the early houses, when the fruit is fully ripe, let the temperature fall to 55° by night, and give plenty of air during the day. Endeavour to keep the foliage green and healthy as long as possible; if proper attention has been paid to preventing the establishment of insects on the Vines, this will be an easy matter, and the additional strength thus secured to the future crop, will be an ample recompense for any extra exertion. PEACH-HOUSES.—The Peaches started early in November will now be approaching maturity, and will, consequently, require more air and less moisture; but in all cases avoid sudden changes. Let the young growths be tied neatly in, retaining no more shoots than will be required at the winter training; otherwise, a crowded and sickly foliage will be the consequence. CHERRIES AND APRICOTS.—Let these be frequently examined, and caterpillars or other plagues carefully destroyed.

### FLOWER GARDEN AND SHRUBBERIES.

We must again call attention to the hardening of the young stock of plants, preparatory to bedding out, the season for which is now so fast approaching. Young plants which were potted in small pots early in the spring, should be temporarily planted in frames of soil; but if this is inconvenient, it will be an advantage to give them an occasional watering with liquid manure, or guano-water, to keep them in a healthy state till the season will admit of their being planted in the open ground. Many of the kinds, if permitted to become stunted in their growth, are not easily induced to start again, especially if much dry weather occurs at planting-out time. The future occupants of the beds will be much benefited if the interim be employed in turning the soil over again, and exposing a new surface to the influence of the sun and air. In moderately warm localities, Chrysanthemums are very ornamental, as late autumn flowering plants, if planted now against a south wall. Half-hardy annuals sown in frames, &c., should be pricked out at greater distances apart, that they may be strengthened a little before they are removed to the flower beds. The sowing of hardy annuals, unless already done, should be immediately attended to, if they are required for early flowering. Of those kinds which come quickly to maturity, it is a good plan to sow a few patches once in three weeks to the end of June, by which a succession of gaiety will be produced, throughout the summer and autumn.

### FLORISTS' FLOWERS.

This most singular season appears to puzzle most Tulip growers, and the late cold dry weather has retarded the beds so much, that it is most probable, though early blooms were anticipated, that the flowering season will be about the usual period. A good way of supporting blooms is to place a neat stick, about 2 feet high, at regular distances between the bulbs, so that by attaching four short metallic wires, about the thickness of common skewers, at right angles, they are enabled (by making a hook or loop at the other end which surrounds the Tulip stem), to hold four blooms perfectly erect, preventing them from being swayed about by the wind, or damaging each other. The light net must be kept over, to prevent injury from sudden hail storms, though not so closely as to draw the stems. AURICULAS are blooming strongly this season, and are now rapidly progressing. A piece of thin calico should be thrown over the frame, and as much air as possible be given from below through the slides in the frame, or by other contrivances. RANUNCULUSES.—As the foliage breaks through the soil, they must be carefully gone over, and the soil which has been displaced put gently round the neck of the plant. In other departments as last week.

### KITCHEN GARDEN.

Crops which have been some time on the ground, and especially those amongst which the soil has been much trodden in gathering the produce, as Parsley, Spinach, &c., and the various spring-sown crops as they appear above ground, should have the soil about them loosened with a fork, to allow their roots to penetrate more easily, and at the same time to admit the sun and air more freely. The same operation destroys the young seed weeds which spring up abundantly at this season. After the young plants have gained a little strength they should be thinned if necessary, weeding the rows with the hand. At this period of their growth they should be carefully guarded against the ravages of snails or other insects, which are particularly liable to trouble them in their young and tender state. Proceed with the formation and manuring of Celery trenches as soon as possible, and complete all such work, which is liable to make much mess upon the walks, that the latter may be put in respectable order. Sow Celery on a warm border for late crop, and prick out into frames the young plants of earlier sowings. Make a sowing of dwarf French Beans in a cool frame, to be transplanted into the open air as soon as the weather will permit. Sow Vegetable Marrows and Gourds in 4-inch pots, two seeds in each, and place them in a warm frame. Another sowing should now be made of Cauliflower, Broccoli, Borecole, Cabbages, and Savoys; and dust some quicklime over the young plants of former sowings, to preserve them from slugs. Encourage the growth of Tomatoes in a warm frame, and repot them as soon as they require it, to obtain strong forward plants for turning out as soon as the season will permit. Our short summers render it necessary to be very early with these plants, and this is particularly felt in late cold localities. Where the quantity required is considerable, and the spare spaces upon the walls very limited, a quantity may be grown in 10 or 12-inch pots, taking care that the soil be sufficiently rich to compensate for the restriction in point of quantity. When the season is far enough advanced to admit of the plants being exposed to the open air, they may be placed along a walk-side near a wall, or in any other warm part of the garden. We adopted this plan last year with great success. Repot Capsicums, but do not allow them to flower till they are strong and well established. Prick out Basil, Savory, &c., from the seed-pans into boxes or frames, preparatory to their being planted out next month. Water freely all salads that are now advancing, likewise small seeds just coming through the ground.

State of the Weather near London, for the week ending April 17, 1851, as observed at the Horticultural Garden, Chiswick.

## Notices to Correspondents.

CONIFERS: *Ballandyne.* Prune them when they have left off growing in the autumn. They bear it very well.

CONSERVATORY: *M M D.* A letter dated April 10th will not reach us in time to be *considered* and answered by 10 o'clock on the 11th, at which time the *Gardeners' Chronicle* is prepared for publication. Let your reserve greenhouse be span-roofed, glazed with Hartley's rough plate glass, and heated with hot-water. At one end construct a boiler-house and potting shed, so that the gardener may pass with his plants from the shed into the house in all weathers. Construct inside a tank into which all water may be conducted which falls upon the roofs. Your pits might be backed against the sides of your greenhouse. Let there be a walk down the middle of the house. You might run a rod of Vines under the ridge of the roof, clear of the head of passers, but you must not do more. Let the sashes move up and down, so that you may, if you please, leave the roof uncovered when it is necessary to do so. These are general hints. We cannot give plans, for which consult some garden architect.

DEYING HEATHS: *J P.* Dip them into boiling water before you dry them. That will prevent their shedding their leaves.

FANCY GERANIUMS: *Warner.* You will find a descriptive catalogue at p. 72 of the current year's volume.

NAMES OF FRUITS: *X G.* Your Apple is not so acid as the Hunt House. It appears to be the Holland Pippin.

NAMES OF PLANTS: *A Sub.* Daphne collina and Arnica montana.—*W Walker.* 1, Primula villosa with white flowers; 2, Thuja occidentalis; 3, Rites sanguineum. If you would study botany a little you would learn to know such things without assistance.—*E G.* Acacia diptera.—*Redwood.* We believe the Narcissi are these—1, Ajax pumilus, *Salisbury;* 2, a variety called Ajax præcox; 3, Queltia calathina, one of the many varieties of Narcissus odorus of *Linnæus.* It is almost as impossible to determine these things as to name florists' flowers, among which they really ought to be classed. The best account of them is in Dean Herbert's "Amaryllidaceæ."—*C M—l.* Apparently a handsome variety of Oncidium longipes.—*J R M.* Tussilago Farfara.—*A B.* Omphalodes verna. It is *not* Forget-me-Not.—*Reader.* Populus nigra. It is worthless for out-door purposes.—*H F P.* Clianthus puniceus.—*Cymro.* Aubrietia deltoidea, Rhododendron dauricum. There is a white Periwinkle; but we have not seen a double white.—*S D.* Hyoscyamus scopolia.—*F R S.* Dryandra Baxteri.—*Ch Smith.* Dendrobium Paxtoni.—*H.* The Gooseberry leaves are attacked by Erysiphe communis; the white fibres are the mycelium; the dark brown spherical centre is the peridium.

PEAS: *A Gardener.* You have lost your Peas by your own mismanagement, and not by following the directions in the Calendar, which is written by one of the most experienced gardeners in England. Are you really simple enough to believe that your Pea-sticks have produced "the most miserablest plants" you ever saw? It is time to thin your Apricots, if they are what you describe. There is no reason why you should not disbud now, *if you know how.*

ROCK PLANTS: *H S.* Aubrietia, Arabis alpina, Alyssums, Musk, Saxifrages, Soldanella alpina, Sedums, Erinus hispanicus, Saponaria ocymoides, Aquilegia Skinneri and perhaps glandulosa, Primula altaica and other sorts, Verbenas, Petunias, Violets, and hardy Ferns.

STRAWBERRIES: *A B.* Your temperature at the commencement was at least 10° too high. If you do not begin with little heat, and force gradually, they are sure to go "blind."

VERBENAS: *Warner.* Bride, white, large truss; Briseis, rosy purple, distinct and striking; Defiance, scarlet, large truss, strong habit; Heloise, blueish purple; Princess Alice, white, with cherry centre, large truss; Royal purple, deep purple; St. Margaret, crimson, with a violet centre; Tomy, dark maroon, striking; Valentine de Saveuse, blueish lilac; Eclipse, blush, with pink stripes; Vulcan Superb, bright crimson, very large; and Psyche, rosy purple, with crimson centre.*

VINES: *J A, Limerick.* For a succession in a bothouse, 16 feet long:—Royal Muscadine, Black Hamburgh, White Muscat of Alexandria, and Oldaker's St. Peter's; four will be sufficient. Vines, of course, must be kept very thin, if you introduce them into a greenhouse. They are not, generally speaking, advantageous to greenhouse plants, but rather the contrary.

WATER TANKS: *E F L.* A 14-inch wall will support a tank of the size you mention. Make the tank of wood lined with lead or gutta percha. Asphalte won't answer.

MISC. *Holloway.* Cerfeuil is Chervil, and Scarole is Batavian Endive; the variety you have received is probably that generally grown for the Paris market.—*A J B.* Guatemala Tobacco is a very fine *white*-flowered kind, and requires precisely the same treatment as common Virginian Tobacco; to be raised in heat, and planted out singly about 2 feet apart, in rows 3 feet asunder, when the frost is gone.—*Ravenswood.* Your Maurandya has probably suffered from too much wet at the root. You had better defer the removal of your Copper Beech and Arbor-vitæ till next September.

### SEEDLING FLOWERS.

CINERARIAS: *D D.* All well worth cultivating except the blue one, which is worthless.—*A V, Mid-Lothian.* 1, Pure white, flower medium sized, round and flat, and of good substance. One of the best of its class. 2, White, edged with lavender, and having a centre of the same colour; a clean-looking good flower. 3, Dark chocolate centre surrounded by a belt of white, and edged with purple. A pretty flower, but both this and No. 2 are rather too starry.—*J W.* All inferior to kinds now in cultivation.

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS,

AS THE

ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by Dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9l. 10s. per ton, or 9l. 5s. in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.

40, Bridge-street, Blackfriars, London.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

ARTIFICIAL MANURES.—PRIVATE INSTRUCTIONS in Chemical Analysis and the most approved methods of making Artificial Manures are given by J. C. NESBIT, F.C.S., F.G.S., at the Laboratories, Scientific School, 38, Kennington-lane, London.

Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

GUANO AND OTHER MANURES.—Peruvian Guano of the finest quality; Superphosphate of Lime; Gypsum; Salt; Nitrate of Soda; Moffat's Patent Concentrated City Sewage Manure, and all others of known value.—Apply to MARK FOTHERGILL, 204, Upper Thames-street, London.

DESICCATED ANIMAL MANURE.—This Manure, which has proved so eminently successful in the culture of both Cereal and Green Crops, can now be had of the Manufacturers, J. M'CALL and Co, 60, Spring Gardens, Manchester; RITCHIE and M'CALL, 137, Houndsditch, London; and of all Agents. Price 6l. 10s. per ton, including bags delivered on the rail in Manchester.—Copies of Analysis and Testimonials forwarded post free on application. Agents wanted.

HOSE FOR LIQUID MANURE, Fire-engine, and agricultural purposes, made of canvass, lined and coated with gutta purcha; it is about one-third the price of leather or india-rubber, will convey liquids of all kinds under a heavy pressure, it is extensively used at the Government public works; also by the navy, and amongst agriculturists, giving universal satisfaction. Testimonials and prices may be obtained of Messrs. Burgess and Key, 103, Newgate-street, sole manufacturers.—London Agents: Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.—Country Agents: Messrs. Ransome and Parsons, Ipswich; Messrs. J. and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. S. Wilson, Agent for Scotland.

TRUE DRUMHEADS for CATTLE, also EARLY BATTERSEA, the large Imperial, Early Vanack, &c., at THOMAS WELLANDS, Surrey Gardens, near Godalming, Surrey, packed and delivered at the Godalming Station, 3s. 6d. per 1000; the large Asiatic Cauliflower Plants, 3s. per 100.

AGRICULTURAL SEEDS.

BASS & BROWN'S PRICED AND DESCRIPTIVE AGRICULTURAL SEED LIST may be had free by post. The following of best quality delivered free to London, Ipswich, Norwich, or any station on the same line of Railway.

PERMANENT PASTURE GRASSES, to suit various soils.—Mixtures for soils in general, including proper proportions of Clover, per acre, 24s.

Mixtures supplied to suit soils of every description, the nature of the soil being stated; and if intended to be sown either with or without a crop. Any sorts supplied separate, if required, according to order, of which a list of prices of different kinds may be had.

FINE MIXED GRASSES FOR LAWNS, BOWLING GREENS, &c., 40s. per acre, 5s. per peck, or 1s. 3d. per lb.

| | | | |
|---|---|---|---|
| RYE-GRASS, true Italian ... | per bushel | 6s. | 6d. |
| ,, Perennial ... ... | ,, | 4 | 6 |
| ,, Stickney's Improved do. | ,, | 6 | 6 |
| ,, Pacey ... ... | ,, | 6 | 0 |
| CARROT, large white Belgian ... | per lb. | 0 | 8 |
| ,, large Altringham ... | ,, | 1 | 0 |
| MANGOLD WURZEL—Red Globe and Yellow Globe ... ... | ,, | 0 | 6 |
| ,, Long Yellow | ,, | 0 | 9 |
| Drumhead Cattle Cabbage ... | ,, | 2 | 6 |
| Rivers' new Stubble Swede Turnip | ,, | 2 | 0 |

The best Stock of Turnips and all other Agricultural Seeds. See our Catalogue. Prices to the Trade on application.

BASS and BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

GRASS AND OTHER SEEDS.

THOMAS GIBBS AND Co., the Seedsmen to the "Royal Agricultural Society of England," corner of **Half Moon-street** Piccadilly, beg to call the attention of their friends to the following Seeds:

Mixtures of selected Natural Grasses for laying down Land to permanent Meadows and Pastures, apportioned to suit the nature of the soil.
Mixtures for portions of Parks near Mansions.
Mixtures for Garden Lawns and Grass Plots.
Mixtures for renovating Old Pasture Land.
Italian and other Rye-grasses.
White Belgian and Red Altringham Carrots.
Gibbs' new very large Parsnip.
Orange Globe Mangold Wurzel.
Long Red and other kinds.
Drumhead and Thousand-headed Cabbages.
Swedes, Hybrids, and other Turnips.
Clovers, Kohl Rabi, French and English Furze.
Sainfoin, Rape, Tares, White Mustard, and all Agricultural and Kitchen Garden Seeds, &c.

Priced Lists are now ready, and will be forwarded free, on application, by post, or otherwise, to corner of **Half Moon-street** Piccadilly, London.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND CO. beg to notice their mixtures of GRASS SEEDS for Laying Land down to Permanent Grass, are now ready for delivery. They have reduced the price to 30s. per acre, allowing 2 bushels 12 lbs. to the acre.

Mixed sorts for improving old Grass Land, 1s. 2d. per lb.

Fine sorts, for forming Lawns, 1s. 3d. per lb. Directions for sowing will accompany the Seeds.

GEORGE GIBBS and Co. will feel happy in sending general priced Catalogues of Agricultural and Garden Seeds, on application to 26, DOWN-STREET, Piccadilly, London.

SKIRVING'S IMPROVED TURNIP SEEDS.

WM. SKIRVING begs to announce to his friends and the public that he has fixed the price of his IMPROVED SWEDE, and also the PURPLE-TOP YELLOW-BULLOCK, at 9d. per lb.

In consequence of W. S. having extended the growth, and having had a very abundant crop of the Seed of his Improved Turnips, he is this season enabled to offer it at the above reduced price, and he is also induced to take this step to prevent Agriculturists being imposed upon by the sale of spurious Seeds, offered at a low rate, under his name.

W. S. can, with perfect confidence, recommend these Turnips as being the best now in cultivation, in every respect, whether for the greatest crop, the best quality, or for keeping, according to the time of sowing.

All other Agricultural Seeds, of the best quality, at very moderate prices. A remittance or reference is requested from unknown Correspondents.

N.B. W. SKIRVING has no Agent in town or country.

Queen-square, Liverpool, April, 1851.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers; Office, 70, Strand, London.

DO YOU BRUISE YOUR OATS?

HORSE KEEP.—Oat Bruisers, Chaff Cutters, Ploughs, 42s., Shares, 5s. per dozen; Rollers, Wheat Mills, Bean Mills, Steam Engines, Scarifiers, Turnip Cutters, Dressing Machines, Drills, Threshing Machines, Wood and Iron Harrows, Steaming Apparatus, Scotch Carts, Hay-making Machines, Horse Hay Rakes, and Drug Mills. First class goods warranted. MARY WEDLAKE and Co., 118, Fenchurch-street. Most liberal discount for cash. Goods delivered free. On receiving six postage-stamps a list, with 107 engravings, will be sent free.

# The Agricultural Gazette.

*SATURDAY, APRIL* 19, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

THURSDAY, April 24—Agricultural Imp. Soc. of Ireland.
WEDNESDAY, — 30—Agricultural Society of England.
THURSDAY, May 1—Agricultural Imp. Soc. of Ireland.

THERE are certain crops whose agricultural merits demand for them a more extensive cultivation than they have hitherto obtained, which deserve, on that account, special notice in this section of our Journal; among them is SAINFOIN, which is almost as much unknown in some districts as it is universally cultivated in others. Plants of the same botanical character, such as Clovers, Tares, &c., are much more general in their distribution over land of varied nature; but they are not of more importance than Sainfoin to the farmer who has land suitable for its growth. On the limestone soils of the Cotswold Hills, and upon the sheep farms of the chalk formation of Wiltshire, Hampshire, and Berkshire, it was, until the more extended introduction of the system of Turnip farming, almost the mainstay of the stock keeper; and even now it is acknowledged to be of so much importance that there is a clause in many leases that a certain quantity of land shall be left in Sainfoin at the expiration of the term, and that this shall be valued to the incoming tenant according to its age and quality. Sainfoin is also grown upon the chalky and gravelly soils of Herts, Cambridgeshire, Suffolk, and Norfolk. In the two latter counties its cultivation is extending rapidly and beneficially to the farmer, as it is found to be one of the best preparatory crops for Wheat, and its produce of hay or sheep feed is well known to be of the most healthy, nutritious, and fattening description. In the southern counties, and upon the Cotswold Hills, the land remains in Sainfoin for a term of years varying from four to seven, and sometimes even more. The first year's growth is inferior to the second; but, after a certain time, the Grasses natural to the land, and the growth of seeds from the hay upon which the sheep are partly fed during winter when upon Turnips, quite smother the Sainfoin, and the produce deteriorates in value; but still the rest the land has from corn cropping imparts a freshness to it, which is shown in the following crop, whether of grain or roots. The small return from the Sainfoin itself, when the land becomes covered with Grass, and the expense of cleaning, are objections to this system, that tell against its being practised upon any other than poor, light, calcareous soils, which are the natural habitat of the plant; and where a moiety of the farmer's returns are made from sheep breeding. In this instance it would be quite impossible to impart and retain fertility by a more economical method. It is a part of the system of those districts to have the old Sainfoin lea dunged and once ploughed, and the Wheat sown broadcast after the wheel-presser; and repeated rollings, harrowings, and treading with sheep, are the means adopted to give the solidity to the soil absolutely requisite to prevent the crop losing plant from wire-worm or frost.

And again, these old Sainfoin leas assist the farmer in another most excellent system of tillage; they are pared and burnt as a preparation for Turnips, to be fed off upon the land and followed by Wheat. However, upon land highly cultivated upon the alternate system, we should by no means advocate the growth of Sainfoin for a term of years, as the reasons given above show that it would be very unprofitable. But for a year, or perhaps for two years, it is likely to make a good return, and to leave the land in a capital condition for Wheat. At the present moment we have a letter before us from a Norfolk farmer, who says the appearance of the Wheat crop this spring, grown after Sainfoin, has induced many to sow it this season more extensively.

The varieties of Sainfoin cultivated in this country are by no means numerous; the common English Sainfoin, which is natural to the chalk and limestone soils, being by far the most extensively grown, and preference is given to this variety where the land is required to be in Sainfoin for several years.

Most extraordinary prices were given a few years since for seed of the Giant Sainfoin, said to have been discovered by Mr. HART, of Ashwell, Herts, and introduced into notice by Mr. THOMAS HINE of Newnham in that county, who describes it as being more rapid in its growth in the spring, and after the first cutting—it will produce in one season two crops of hay, or one of hay and afterwards a crop of seed may be taken.

The French double-cut Sainfoin, as it is termed by dealers in seeds, is very generally cultivated in the central provinces of France, and a considerable quantity of the seed has been imported into this country, and sold at prices very little higher than seed of English growth, during the last few seasons. It is very similar to the Giant Sainfoin, growing quite as quickly, but producing a smaller quantity of leaf.

A gentleman who has grown it two years in Norfolk writes, "I find it early and quick in growing, both in the spring and after mowing, but I do not get heavier hay crops." Another of our correspondents from Suffolk, who farms an extensive tract of light and mixed-soil land in that county, and to whom we are much obliged for his information, says, "I planted part of a field with the French double-cut Sainfoin seed, and the other part with common English—the same quantity of seed per acre, drilled at the same time; so marked was the difference in favour of the French, the first and only year I have tried it, both in thickness of plant and quickness of growth, that I let the *first cut* stand *for seed*, for fear I should *lose the stock*, but I got little or no seed from it. So rapid, however, was the growth after the first crop was cut, that it soon passed in length the common sort, cut long before for hay, and produced a *nice crop of seed the second cut*. The Sainfoins here, in a general way, do not lie more than one or two years. Mine lie two, and then Wheat, for which purpose I very much prefer the French; indeed, if it succeed with me as well in future as it did last year, I should not think of sowing any other." From the above evidence, and from experience of their culture, the last two varieties, from their quicker growth, and from their coming sooner to maturity, may be recommended upon all highly cultivated soils having a calcareous subsoil, the object of the agriculturist being to obtain a large produce the first and second years, and to keep the land clean and in good heart for the Wheat crop.

For aught we know, the French double-cut seed may owe its quicker growth and earlier maturity to the seed being the produce of a warmer climate, more than to its being a distinct variety, as we hear of its degenerating when grown from seed the produce of this country. If it is so it adds another argument, so often advocated, of the importance of a judicious change and selection of seeds. And at the same time it shows that some good to the farmer may come of the proposed repeal of the duty on foreign seeds, as the duty on French Sainfoin is now a very considerable item in its cost.

We shall, in another part of the Paper, enter more minutely into the details of the culture of this crop: our present object being merely to introduce it, as an admirable source of excellent summer food for stock, to the notice of any of our readers situated on calcareous or rocky soils, who may not hitherto have attempted its culture.

## MANAGEMENT OF STEAM ENGINES.

So much value is justly attached to Mr. Mechi's practical observations, that I fear some of his friendly admirers may be led into error, were the advice which he gives in reference to the steam engine to be followed out without a little previous consideration. I quite admit the value of an ash-pan containing water, for a

boiler on a farm, as it may prevent the chances of fire from ashes or clinkers coming in contact with straw or other substances left, too often, lying about. But I beg to question the advantages he claims for this practice, which he so strongly recommends in his paper of the 18th of March (See *Agricultural Gazette* for March 29.)

Now, it is well known that under the most advantageous conditions, it requires 1 lb. of the best coals to raise 10 lbs. of water from 60° to 212°; and as he states that from 100 to 200 gallons (equal to 1000 lbs. to 2000 lbs. weight), are evaporated from his ash-pan by the radiant heat in the course of the working day, it follows that an amount of heat has been abstracted equal to from 100 lbs. to 200 lbs. weight of coals; under the ordinary conditions of engine work, probably nearly double these weights would be required. Then, again, suppose that this immense amount of vapour (at 212°) is carried up through the bars into the fire, and it will not be very difficult to calculate the additional amount of caloric which would then be required to raise its temperature sufficiently to enable it to pass off by the flues and the chimney; a temperature of at least 600° to 800°, all this power being expended outside the boiler, and therefore of no use. In order to ensure perfect combustion, and thus economy of fuel, it is desirable, also, that we should check the admission of more air than is required by the fire, and more particularly of any large quantity of vapour, both of which must appropriate heat, which ought to be all transferred to the boiler. These points can be kept in view, and yet all the advantages claimed by Mr. M. may be obtained by other arrangements less costly, and certainly more philosophical than those which I venture to object to. We must recollect that heat radiates equally in all directions—the natural tendency of heated air to ascend, and the usual mode of applying the draught, cause the greater part to be brought in contact with the lower surface of the boiler; but the remainder is lost either by lateral or vertical radiation. (This effect is seen by Mr. Mechi's report.) Now, by having a boiler so constructed that the fire may be placed in its centre, and thus be surrounded by the water, we are in a condition to avail ourselves of the entire heating power of the fuel, and effectively appropriate the portion which would be lost by the ordinary arrangements. This description of boiler is known by the name of "Cornish boiler," and is particularly adapted to districts where coals are dear.

Some little judgment is required in the selection of coals for the engine—they should be of a free-burning, and not of a coking, character: those best suited for household purposes are generally best suited for the engine: with attention to this point and careful stoking, caking and clinkering are avoided, the draught is unimpeded, and the bars are not burnt. In all cases, however, a simple arrangement of the fire or dead-plate will be found advantageous in regulating the combustion of the fuel. The fires should be kept flat, and 2 to 4 inches thick all over the bars; all fresh coals should be thrown on this plate, where they become partially coked, and the gases, produced by the decomposition of their bituminous matter, passing over the heated surface of the fire, are burnt, instead of being driven up the chimney in the shape of a dense smoke. When the fire requires more fuel, that on the dead-plate should be shovelled forward, and another fresh supply thrown on to it. If this plan is attended to, no smoke will be seen from the stalk, except on lighting up—a plentiful and regular supply of steam will be generated, and a great saving effected, both in fuel and in the wear and tear of the boiler. *W.*

---

Mr. Mechi's plan, as described in your Paper of the 29th ultimo, of using a cast-iron pan filled with water under the grate of his steam boiler, will materially assist the fuel to generate steam, but as his is one on the high-pressure principle, the same advantages may be obtained by having a gas-pipe three-quarters or an inch in diameter, from the waste or exhaust pipe to the space under the grate. There should be a stop-cock in the pipe to regulate the quantity of steam to go through the grate. The pipe may be single or branched off in two or more, to more equally spread the steam; but each pipe should be stopped at the extreme ends, and to have small perforations on the sides or bottom; for if on the top of the pipes, the ashes falling from the grate upon them might stop them up; and there should be some in the bottom of the pipes for the condensed water to escape.

In the same paper there is a new principle of cultivating land, as described by Mr. Smith, in his little work, styled a "Word in Season," which principle is advocated by Mr. Hewitt Davis, whose knowledge and experience stamp the method as one of practical utility. I have one of the first editions, which is only adapted for the spade; and one of the last editions, which is for large holdings. From the first reading of the book I was desirous of working part of my land upon the described method. It only mentions the growth of Wheat; but from the elevation of my land, and its being on the clay slate rock, Oats are a much better paying crop than Wheat.

Now if I should adopt the plan—consume all my Oats with feeding, and in every space between the growing grain to have the manure ploughed or dug in, and either by sowing seed or transplanting to have one row of green crop which, when off, to trench the space, would it be an improvement? *Richard Nicklin, Isle of Man, April 9.*

## THE BREEDING AND REARING OF POULTRY.

Fowls.—The first point of consideration is the breed; this is of much importance when you want to make the most of them; by this I mean both by eggs and the fowls for market. I am inclined to think that a cross between the Spanish and Dorking will answer both purposes best; but as yet it has not been sufficiently tried on this farm, because the eggs of either sort are 1*s.* each; this would involve much expense where the number of hens and cocks kept from one to four years old is over 400; but we are gradually getting this breed; the majority of the present stock are the common dunghill crossed with the male game. This is a hardy breed; but is not much liked by the London poulterers. The true Spanish do not come to maturity soon enough; they are at least eight months before they are fully fledged; but they are most excellent layers, and if you get them early they will begin to lay before Christmas. This is generally a time that eggs sell well. We have this season sold them in November and December at 1*s.* 8*d.* per score; they are now, January, 10*d.*; this price will suggest the importance of having early pullets, though it is a great temptation to sell in May and June, as the price then is more than if you keep them two or three months longer; but we have, the last few years, made it a rule to keep most of the early pullets, selling only the early cocks, being well satisfied that the hens pay best if kept over till the following spring, the eggs they lay generally amounting to more than they were worth themselves; and some of them will want to sit at Christmas or before, and it is impossible to have them too early, though they require more attention at this early period, yet they are invariably the healthiest and largest birds. We have now, January 21st, over 50 strong chickens, and have not lost one as yet.

I will state now the detail of the management of them on this farm, as stated above. We endeavour to have chickens as early in the year as possible, and continue to set all the hens that show any disposition to set during the entire year, except such as have been proved bad mothers or unsteady sitters, and there are many that are good layers, yet are the worst mothers in the world. This requires, like everything relating to poultry (and in fact everything else) the constant eye of the master, not once or twice a week, but unremitting attention every day, for however fortunate you may be in getting a person to attend to them, they will grow twice as fast under the close inspection of the master. We have here a middle-aged man, who from bodily infirmity has been prevented doing any hard work, but has been odd man and boy on this farm all his life; from being all his life amongst poultry, he has acquired a tolerable share of practical knowledge, and what is of still more importance, a liking for them; and it is useless to have a person with poultry who has not this feeling added to a large share of patience and good temper.

I will state here the means pursued to engender this feeling. I believe it is well understood that if you wish any person to study your interest you must show them that theirs is combined with it. This man has a direct interest in both the eggs and poultry when sold; he has 1*d.* per score eggs for all he may collect out of the poultry-houses, and 1*d.* for every fowl sold; 2*d.* for each turkey and goose; this added to a small weekly regular wage makes his place quite as good as any man on the farm, and this he deserves, for he is required to be stirring by day-break, and when there are a large quantity of young he cannot leave them till dark.

I have found that baskets, or common hampers are the best for the hens' nests, from their being so easily washed; this is best done by taking a few at a time and either putting them into cold water, and letting them soak all night; or, what is still better, putting them into a large tub and pouring boiling water over them, letting them soak for an hour or two, when all the dirt may be easily removed with a hard scrubbing-brush. This plan ensures the destruction of the numerous insects lodging in the crevices of the basket, and apt to escape if only cold water is used. The basket must be thoroughly dried before it is returned to its place; it is a good plan to dust the basket inside and out with lime powdered and put into a coarse piece of linen. After washing, a little straw is put at the bottom of the basket, or I think the hens generally prefer hay, but I believe that it encourages the insects more than straw; and I would recommend a quantity of dry ashes to be put at the bottom, under the hay or straw, and packed all round the outside, this keeps out the cold wind, and I have no doubt that it contributes to keep an equal temperature, resembling, in some measure, the natural nest the hen will often choose for herself at the bottom of an old hedge or bank; this is not required after April.

The hens ought to be disturbed as little as possible during the time they are sitting; yet they require to have food, and more particularly CLEAN water, put within their reach; and, if they do not come off the nest every day, or at any rate every other, they should be gently removed from the nest and kept off for 10 or 15 minutes, and a good sitter will almost starve herself before she will leave the nest. I always mark the eggs with the day of the month when set; this is very convenient where you have many setting at the same time, as sometimes the chick requires a little assistance to effect its escape. But never be in a hurry. Sometimes the weak chicks will be 24 hours after their stronger brethren, and it often happens that the weak ones are glued to the shell of the egg; when so, the egg ought to be immediately broken and removed as gently as possible; the part sticking to the chick must be softened with a little warm water, and great care used to get it off, for, if the skin of the chick is ever so slightly injured, it will die. The chicks do not require any food for 24 hours after being hatched; after that they will begin to eat: try them with a little bread soaked in milk and a little Wheat; they will pick up Wheat before any other grain. It is of much importance to get them to pick up their own food as soon as possible, as they do much better when they do so, yet they ought not to be allowed to go longer than 24 hours after leaving the shell; they ought to be fed by hand with bread soaked in milk; a woman does this best, as her fingers are smaller, yet you may manage it pretty well with a small piece of stick, shaped something like a marrow spoon, only much smaller, of course; and by placing the hand round the neck of the chick, the thumb on one side of the bill, the forefinger on the other, you will find no difficulty in opening the mouth and introducing any food necessary. I forgot to mention, in speaking of the chicks that did not find their way out of the shell soon after the egg was chipped, that it is necessary to enlarge the opening, as it must be done very gently, and a little at a time, by breaking off a small portion of the shell all round the chipped part, say an eighth of an inch at a time. It is best in the early part of the season to keep them in-doors (except it is very fine and dry, like this season has been hitherto) for at least a fortnight, giving them plenty of room; a barn is a famous place, and I regret to say that we have plenty of them unoccupied at this early season. Our barns are built entirely of timber, and afford plenty of ventilation, without which no animal can exist for any length of time in health, and for poultry it is indispensable. To this point, and the keeping them and everything relating to them scrupulously clean, I lay the success that has attended the rearing of poultry on this farm, and without this I am satisfied any one who may try to bring up any quantity of poultry will meet with much disappointment. The chicks have now reached say a month or six weeks of age; this is rather a trying time with them—getting their first pen feathers; but if they are well attended to they will soon get over it. They are, whenever the weather is suitable, carried out into a pasture; every day the hen is confined in a coop, the chicks having the liberty of running about. If the hen is not thus confined, she is apt to roam too far with her young. We endeavour to keep each brood as far from one another as possible, as many diseases that they are subject to are very contagious. This farm has many advantages that a smaller one has not. There are eight off-hand places, five of them with cottages attached, and at all of them are a large quantity, both of chickens and turkeys, raised every year. I do not think that any person can do as well when they are all together, but I have no doubt that every farmer may raise five chickens and the same quantity of turkeys to each acre.

We have found that the best time to send chickens to London is from October to Christmas for the cocks of the current year, and from Christmas to June for the pullets of last year. They are allowed to lay till they show a disposition to sit, or till the middle or latter end of May, when they are immediately put into the fatting coop and fed upon Barley-meal, and either Carrots or Swede Turnips, made warm every time they are fed (three times a day); this has been found to answer equally well with Barley-meal alone, and of course at a much less expense. The roots require to be steamed till they will mash easily, and mixed in the proportion of one of roots to three of meal.

Of course you will get rid of all the early chickens (except those pullets kept for stock, and a few to begin to lay early), that are of any size in May and June, the two best months in the year; we sold them little larger than pigeons in May, 1850, at 3*s.* 4*d.* each, and this is the best price for many years, with the exception of one year, I believe, when the scarcity was previous to the passing of the free-trade measure. This is an important fact, as showing that the demand must have increased, or they could not have kept up the price. The chickens, if well kept, do not require to be in the fatting coop more than a week or 10 days; if shut up longer, they are apt to get a bad colour and lose weight, instead of gaining, as they are close packed in the coop, and kept with scarcely any light. I may add, the system is pursued at all the off-hand places, with regard to remunerating the labourers' wives for rearing the chickens and collecting the eggs, as I mentioned regarding the poultryman at the home-farm.

About the profit of rearing poultry there are great difficulties, as every one who has thought about it well knows. There are always, or nearly so, one or two flails going in each of the yards belonging to this farm, and of course there are many grains unavoidably thrown out, which the fowls employ themselves in picking up as the straw is thrown out from the barn; and as there is a large number of pigs fatted here on steamed food, of which the fowls partake with the greatest avidity, it is still more difficult in this place. Their fondness for this food has led to its being regularly given to them, more particularly during the winter months, and as it is always given warm, it no doubt induces them to begin to lay earlier than they otherwise would; we have found it beneficial to give them a small quantity of greaves (the refuse from tallow melters) during November, December, and January, as then they have more difficulty in getting worms, their natural animal food. The greaves should be put into a little warm water a few hours before required, then broke into minute pieces, and intimately mixed with the

steamed food, which may consist of half Swede Turnips, (the best root for them) or Mangold Wurzel, or Carrots; the other half either Barley, or Oatmeal, not dressed too much, with a handful or two of greaves, during the three months mentioned; this proportion will do well till you put them up to fatten; but they require a tolerably good feed of dry corn once a day (say mid-day); this will, of course, consist of the tail corn, Wheat, Barley, and Oats; they require this more, as the flails are laid up as the spring advances; they require good living, without making them fat.

I believe that the tail corn cannot be better employed than in feeding poultry, though it is always spoken of with such contempt; in fact it has afforded me much amusement to hear the remarks made upon a former communication of mine to your Paper, and copied into the *County Chronicle* on this subject. I can say it is not looked upon with indifference here—quite the reverse. It has been found most convenient here every week that they have been sent to London; and this, on a holding of little under 1000 acres, shows that it is considered no trifling matter. I do not say anything upon the diseases of fowls, as there are many good books on this subject by persons better qualified to speak on this subject than any common farmer can be expected to be. *E. X.*

## Home Correspondence.

*Adulteration of Manures.*—The attention of the agricultural public has recently been directed very properly to the extensive adulteration carried on with guano and other manures. Allow me to observe that agriculturists have themselves to blame very much for the extent of this mischief, by their incessant craving after cheapness, and their encouragement to anybody, and everybody, who, will minister to their depraved appetite, for depraved it undoubtedly is, when indulged in with almost total disregard to the real merits of the articles purchased. It is sufficient for a manure to be offered in the market, under the name of some recognized manure, at a less price than that at which the genuine article can be purchased for, from some respectable manufacturer, and some farmer will be found silly enough to purchase it, provided always, that it smells good. For the accuracy of the following cases, the writer can vouch, and they are all of recent occurence. Case I.—A respectable farmer, a few weeks since, purchased a certain quantity of top dressing for Wheat, from a total stranger, so much so, that he absolutely forgot the name and abode of the party; having taken no memorandum of the transaction, and was therefore unable to complain of the non-arrival of the manure at the time appointed. He knew nothing of the party previously, and was not recommended to him, but was induced to purchase solely because the manure appeared cheap, and had a strong smell. Case II.—Some time since, a quantity of Peruvian guano, stated to be of the finest quality, was purchased by some gentlemen of a London dealer, at 12*s.* per ton under the price that would have been charged them in the regular course of business. A week since, a sample of the article was sent to the writer for examination, and on submitting it to a few analytical experiments, I readily found that it possessed double the water, and double the ash contained in genuine Peruvian, and that in fact it was damaged Peruvian extensively adulterated with earthen admixtures. Case III.—A quantity of inferior Chilian guano has lately been extensively sold by corn dealers as genuine Peruvian, at 20*s.* under the market price, the guano being mostly taken in exchange for corn. This system of barter is very injurious to farmers, and they stand in their own light, when they encourage it. Case IV.—A quantity of inferior Wheat was offered to a manure manufacturer for a given quantity of superphosphate of lime, who made a calculation, allowing the full value the Wheat would realise, and offering the utmost quantity of genuine superphosphate that could be sold for the amount in exchange; but this would not suit the farmer, who went to a corn merchant not quite so scrupulous in the quality of his manures, who at once accepted the bargain. I have mentioned these facts to show the very loose manner in which the farmers spend their money in the purchase of manures, and the encouragement they are thereby giving to dishonesty and fraud; and, I venture to assert, that amongst the various suggested methods of remedying the evil complained of, none will be found more effectual than that of paying some regard to the standing and respectability of the party from whom manures are purchased, and enabling, by giving him a fair price, to retain the genuineness and quality of his manures. *W. C. Spooner.*

*Open Furrows on Drained Land.*—Mr. Mechi, in the *Agricultural Gazette* of February 8th and March 22d, has given his opinion that draining in stiff clay soils will not enable open furrows to be dispensed with. This is a point of much importance, and well worthy of the discussion which he invites, especially as he is not singular in his views. It involves, to a considerable extent, the question, whether clay soils can be gradually made friable by draining, followed by a proper system of cropping and tillage; for if the rain falling upon such soils can be made to sink readily through them, and pass off by the drains below, air will also be freely admitted, and the soil to the required depth must be gradually improved, even without the aid of deep tillage; but if the drains do not draw down the water readily and perfectly, the soil neither is sufficiently open, nor can it well be kept so to the proper depth, either by subsoiling or other means. Any accumulation of water re-cements its particles more or less, and may render subsoiling or even the more expensive operations of digging or liberal manuring, of little avail. It is very desirable, therefore, that the whole of the surplus water should sink equally and quickly down to the drains, acting upon all the particles of earth in its descent; and I think we should not be too ready to conclude that this object cannot be attained, seeing that this would almost be to abandon the hope of managing clay soils to advantage either at present or prospectively. We should rather try the effect of drains at narrow intervals and of a suitable depth, their bottoms accurately cut, and laid with tiles of considerable size, so as to maintain a clear circulation of air throughout, taking care also to fill them above the tiles with porous material, rejecting the whole of the stiff subsoil if necessary. How far Mr. Mechi's draining comes up to these conditions is not for me to say, farther than by commenting on the information furnished by him; but it is evident that the neglect of any one of them may materially influence the result. His width of only four yards ought to answer, especially in a dry climate such as that of Essex; but the 10 inches of stones with pipes laid above them may perhaps never prove effectual. Stone drains without a proper opening below are by no means so efficient as some suppose. I know a stiff field, half of which was drained 10 years ago with stones, and the other half the succeeding year with tiles; the subsoil was tolerably equal; the draining in both cases was carefully conducted, and the drains were all at the same depth and distance. The tile draining is efficient. The stone draining now is not so. The tile drains may act a long time, but not being constructed according to the improved methods now known, they will eventually fail. The stone drains will become less effectual every year, and must soon be replaced. As regards the width of 36 feet, Mr. Mechi cannot reasonably expect drains so placed to answer his purpose; that is, if his soil is really a stiff clay. The distance is much too great, except for porous soil. It is a great error to drain imperfectly, merely for the sake of saving a few drains in a field. The success of other costly operations so much depends upon perfect drainage, that when these operations are undertaken, a loss may be sustained every year, equal to the saving in the number of drains. The form of the surface also materially affects the filtration of water. An open furrow glazed over with the plough and trampled by horses, when harrowing, naturally bears up the water, and conveys it along until it forms a considerable stream, and some farmers to prevent this lay the land flat, or avoid clearing out the furrows after harrowing, believing that the water then sinks down without causing injury. Mr. Mechi himself says that the quantity of water entering the furrows at any one place is small, but being carried forward it soon accumulates, and a stone drain, or even a carelessly laid tile drain, with an opening at any place ready to absorb it, would not be very safe. The permanent improvement of heavy soils is a most important matter, and every day's experience shows that it can be done with certainty, but the means taken to attain this desirable result are very various. In some places deep tillage, thorough pulverization, liberal manuring, and a good system of green and white crops, all founded upon thorough drainage, are the rule; and the land so managed, not only yields abundantly at the time, but is always under improvements; whilst in other places, shallow ploughing, with all the other features of mismanagement usually attendant thereon, are still common. The crops are consequently poor and precarious, and the soil is deteriorated rather than improved. I have seen several patches of originally stiff land, which were at one time cultivated as garden ground. The buildings and gardens have long since been removed, but these patches always maintain a great superiority over the surrounding land, producing much better crops, with less labour and manure. There is little doubt that the same management would have produced a similar result on all the land in the neighbourhood, and the plough, harrows, and grubber, if properly used, would make a good substitute for the spade. It is to be hoped, therefore, that the correspondents of the *Agricultural Gazette* will continue to discuss this subject until the whole truth has been elicited and made known. *James Donald, March* 25.

*Premium List of the English Agricultural Society.*—On looking over the different premiums to be awarded at the approaching meeting in July, I am very much amused at the selection made between the "Welch, Irish, and other pure breeds;" because, I do consider that there is as much difference between the Welch cattle and the Irish, as between the Short-horns and Herefords if they were to be classed with any other breed of cattle; why not class them with the Devons, which are so much alike in every point except colour, and as unlike any "Irish" as a Hottentot and white man. *A Bortoeth Farmer, March 27th.*

*Chicory.*—In an article on the cultivation of Chicory, which appeared in the *Agricultural Gazette* of March 8th, the following passage occurs: "*Time for Sowing.*—It must be sown within a day or two of the 12th of May, not later or earlier; if later, it will produce runners or woody fibrous roots; if earlier, it will seed, which it should not do." Such a direction appears to me to be suitable only for an invariable climate. In Britain the seasons differ from each other considerably as regards earliness, and such a precise rule is surely, therefore, of doubtful propriety. On an average of seasons, the 12th of May may be the best time for sowing in a certain latitude, that of Cambridgeshire, for instance; but, if such be the case, is it not advisable to sow a few days earlier in the north of England, or in Scotland? A little more information on this point will be interesting to many of your readers who, like myself, know little about the proper culture of the plant. Are the roots liable to injury from frost before they are taken up? If they incur much risk of this kind, will they be of less value in any other respect than as regards bulk by being pulled before the middle of October? I understand that the growth of Chicory will be attempted this year in several parts of the country in which there is more reason to be apprehensive of early frosts than in those districts where it has hitherto been chiefly cultivated. *J. D. H.* [The information referred to is true of the south of England. We have no information regarding the growth of the crop in Scotland.]

## Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Weekly Council was held at the Society's house in Hanover-square on Wednesday last, the 16th of April; present, Mr. Raymond Barker, Vice-President, in the chair; Lord Berners, Sir Robert Price, Bart, M.P., Sir John V. B. Johnstone, Bart., M.P., Don Domingo Savignon, Mr. Burke, Col. Challoner, Mr. Clarke, Mr. C. Cure, Mr. Dyer, Mr. Gadesden, Mr. Brandreth Gibbs, Col. Hall, M.P., Mr. Fisher Hobbs, Mr. Kinder, Mr. W. Long, Mr. Parkins, Mr. Pocock, Mr. Rowlandson, Prof. Sewell, Mr. Sheridan, M.P., Mr. R. Thompson, Prof. Way, and Mr. G. Wood.

The following new members were elected:

Burbury, John Jackson, Ibstock Grange, Leicestershire.
Nicholetts, John Toller, South Petherton, Somerset.
Parrott, Geo. Lewis, Parsonage, Aveley, Romford, Essex.

The names of six candidates for election at the next meeting were then read.

Communications were received from Mr. Lister Maw, on the desirableness of establishing principles on which judgment is given in the award of prizes to breeding stock at the country meetings of the Society; and from Col. Hall, M.P., correcting a misapprehension of his meaning at the last Council, in reference to the height of the Turnip plant, when he employed the press-roller, and the exact address of the firm who supplied him with that implement: "The Turnips were from 2 to 3 inches in height, instead of 6 inches, when the press-roller was applied for the destruction of the wire-worm; and the makers of the implement were Barrett and Ashton, of Hull, instead of Barrett and Co., of Reading."

Among the presents made to the Society, were the Bombay Magnetical and Meteorological observations for 1846-7, from the East India Company; series of reports on Flax cultivation and management, by the Royal Flax Society at Belfast; Treatise on the Cultivation and Management of Flax, with instructions in the various Belgian methods of growing and preparing it for market, from Mr. E. F. Deman; Lecture on the Blights of the British Farm, arising from Parasitic Fungi, from Dr. Plomley, of Maidstone; and a Treatise on Land Drainage, Embankment, and Irrigation, from Mr. Donald, C. E.

Thanks having been ordered for these communications and presents, an interesting discussion ensued on the mode of treating the fibre of Rye-grass and Flax for the manufacturer; in the course of which Mr. Rowlandson, Lord Berners, Colonel Challoner, Mr. Parkins, Sir Robert Price, and Professor Way furnished valuable hints, suggestions, and results of personal experience.

A Special Council was held on the same day, the Earl of Ducie, Vice-President, in the chair. The following members of the Council and Governors were present:—Lord Berners, Sir Matthew White Ridley, Bart., Sir Robert Price, Bart., M.P., Sir John V. B. Johnstone, Bart., M. P., Mr. Raymond Barker, Mr. Burke, Colonel Challoner, Mr. Brandreth Gibbs, Mr. Fisher Hobbs, Mr. Kinder, Professor Sewell, Mr. Shelley, Mr. Sheridan, M.P., and Professor Way.

The Marquis of Downshire, Colonel Challoner, Mr. Fisher Hobbs, Mr. Brandreth Gibbs, Mr. Raymond Barker, Mr. Jonas, and Mr. Shaw, accompanied by Mr. Hudson, the Secretary of the Society, having visited Windsor on Monday last, for the purpose of inspecting the sites for the Country Meeting, Colonel Challoner presented the following Report of that Inspection Committee, which was read and adopted.

"The Inspection Committee, in pursuance of the instructions of the Council, at their last monthly meeting, proceeded on Monday the 14th instant, to visit the site in Windsor Park, so graciously placed at the disposal of the Society by Her Majesty, for the purposes of its country meeting to be held this year in the month of July. The Committee made a careful survey of the site proposed for the show-yard and pavilion; and having received from the gentlemen by whom they were accompanied every reply to their enquiries, they took into their mature deliberation and discussion the several points on which they had been called upon by the Council to make their report, and finally agreed unanimously to the following recommendations:—

"I. That the site proposed by the authorities of Windsor is in every respect most eligible for the purposes of the country meeting; being a firm level mead, on a dry gravelly soil, 19 acres in extent, lying immediately beneath the slopes and terraces of Windsor Castle, and nearly contiguous to the railway stations and the public road leading from the Home-park into the town.

"II. That on this site a show-yard should be erected, covering an area of 10 acres; capable, however, from the usual mode of its construction, of being enlarged or

contracted in its dimensions, to the size actually required, at the time of the meeting, for the accommodation of such a number of animals as may be entered for competition by the 17th of May, the latest day for receiving certificates. The Committee are of opinion that it will be desirable to have the show-yard so constructed that its intersecting lines may be either parallel with, or at right angles to the north front of the castle, all the exhibition-sheds being placed at right angles to it, and their middle avenue in a direct line with its centre: an arrangement by which both the symmetry and perspective of the whole will be preserved; and they recommend that Mr. Brandreth Gibbs should be requested to favour the Society with his plan of the yard, as usual.

"III. That the pavilion for the great dinner of the Society should be erected in the Home-park, on a site further removed to the north, between the show-yard and the line of railway; and that Mr. Manning be desired to prepare the requisite plan for it, embodying the suggestions of Mr. Shaw, one of the stewards of that department, as well as the suggestions of other members of the Committee, in reference to the convenient adaptation of the building to the special purposes of the meeting.

"IV. That the Guildhall and other official rooms kindly placed at the disposal of the Society by the authorities of Windsor, appear to the Committee to be well adapted to the purposes for which they have been severally offered."

The Council then rescinded their resolution of the 20th of February last, by which they had arranged with the Commissioners of Woods and Forests to hold the Country Meeting of this year in Bushy Park, and substituted the Windsor Home Park in its place, the Secretary being authorised to communicate this decision to the Mayor of Windsor, and to inform him that it was made under the usual condition, that by that day week the requisite memorandum of agreement should be entered into by him, on the part of the authorities of Windsor, with the Secretary, on the part of the Society, under the seals of their respective corporate bodies.

The meetings of the Council stand adjourned over Easter-week, to Wednesday the 30th of April.

## Farmers' Clubs.

Probus, *Jan.* 17: *Farm Leases.*—Mr. Henry Tresawna, the secretary of the club, read the report of the committee. This document gave a satisfactory account of the progress and present position of the club. It stated that the present was the 13th anniversary of the club, which, it was believed, was the second Farmers' club established in England (the Harleston being the first). Other farmers' clubs had been established in Cornwall and other counties, the mode of conducting which was so much akin to that of the Probus Club that this might, without impropriety, be regarded as the parent club of the West of England. The report referred with pride to the prize essays which had been written by the members of the club, and stated that since the anniversary meeting in January, 1849, the following lectures had been delivered at the monthly meetings:

1849: March.—Mr. Bassett, on waste lands and the best method of cultivating them.
" April.—Mr. Brewer, on the cultivation of the Carrot.
" May.—Mr. James Davis, on the cultivation of Mangold Wurzel.
" June.—Mr. Peter Davis, on the cultivation of Clover.
" July.—Mr. R. Doble, on the harvesting of corn.
" Sept.—Mr. Downing, on the secretions and excretions of plants, in connection with the proper rotation of crops.

In November and December some miscellaneous subjects were discussed, having reference to experiments conducted by several of the members with various manures on different crops. During the past year, other useful subjects had been brought forward; amongst which might be mentioned, with approval, Mr. James's lecture on the growth and consumption of Turnips, Mr. Kendall's on the rotation of crops, and Mr. Charles Whitford's on the history of agriculture. The report concluded as follows:—"We trust we shall continue to prosper as we have hitherto done. We have endeavoured to exclude everything like party politics from our meetings; and, whilst deeply sensible of the great wrong that has been committed on the agricultural community, we can discuss with coolness and impartiality every social question with which our well-being is mixed up, and hope to dispassionately weigh every remedial measure which now or hereafter may be brought forward for our supposed benefit."—Mr. Olver, of Trescow, in St. Mabyn, then proceeded to the reading of his paper on the subject of leases. He said: Leases are of great antiquity; they were granted by ancient Britons (who possessed more land then they could cultivate or manage profitably) to their slaves, and subsequently to free British subjects. And I believe that many in the nineteenth century contain them entire as transmitted from their earliest history, and fresh clauses have, from time to time, been added, which are very prejudicial to the prosperity and progress of agriculture. Leases are made for the purpose of protecting landlords; but the protection they afford them, is such as that afforded by an aged Oak to shrubs beneath its branches—while it shelters them from an occasional storm, its baneful effects are very perceptible; every plant within its pernicious influence dwindles. And I would ask, what is the state of agriculture in this county, when compared with that of the merchant, the manufacturer, or the mariner? Why, dwindling; and its condition would have been worse, had not some farmers had moral courage enough to let their leases remain unheeded on the "shelf." Instead of leases encouraging good farming, they compel persons to farm badly. But when we consider by whom they are made, this is no wonder. Leases generally are made by persons quite ignorant of the principles of agriculture. Can there be anything more ridiculous than a landlord, probably his steward, and a solicitor (neither of them knowing how to raise the rent of a farm one year), sitting in an office and drawing a plan how a tenant is to manage a farm to enable him to pay his rent for 14 years? Surely practical agriculturists would be the fit persons to be consulted in making leases. But there is no class of persons capable of laying down rules how a farm can be managed for 14 years, so that the landlord and tenant may each derive the greatest amount of profit. And it must be remembered that their interests are identified. This brings me to the first remarks I would make on the ill effects of our existing leases. Leases are invariably made to extend over a certain period, generally from 7 to 14 years. Now any fixed period is a bane to the progress of agriculture, because it takes the first half of the tenant's term to get his land in order. During that time he rarely ever derives any profit from its cultivation; for, in addition to the extra expense he is at in cultivating and manuring the land, his crops are frequently very deficient, in consequence of the land being too much worked for the purpose of cleaning it, so that there becomes a want of solidity so essential to the growth and perfecting of most of our cultivated crops; and particularly in light soils, which are most adapted to the growth of weeds. The latter part of the term is a period when the tenant's efforts begin to slacken. In order to reimburse himself in the short remaining time, he finds it necessary to discharge some of his labourers, and to employ a less number of working cattle; hence the farm soon falls back to its original state of foulness. But the tenant has another object in letting the farm return again to its former state: viz., that of taking it for another term for some 20 or 30 per cent. less than he would probably have to pay for it had he kept up its fertility—so the land does not increase in its intrinsic value. Neither has the owner any right to expect it would—and the tenant is labouring one half his time in vain. Under our existing leases there should be an understanding between landlord and tenant for a fresh term, at least three years prior to the expiration of the first. Then, if the tenant were certain of leaving, he would not have that inducement for racking the land which I have before stated.

*Payment of Rent.*—Leases invariably give landlords the power to distrain for rent, and to pay themselves before all other creditors. This clause is not only unjust, but is prejudicial to the agricultural interest. In the first place it is unjust, because, in consequence of that clause, landlords are often induced to take tenants who offer the highest rent, without inquiring into their circumstances. When a stranger comes into a neighbourhood, it is reasonable that tradesmen should solicit his favours; and since he is a chosen tenant before others whom they know to be responsible men, they feel themselves justified in supplying him with goods. In case this tenant should become insolvent, in consequence of paying too high a rent for his farm, or for want of sufficient capital to manage it, certainly it would be but just that the landlord should participate in the loss, at least in common with his other creditors. Further, this clause is prejudicial to the agricultural interest by depriving it of more capital. "Men of straw," by offering exorbitant rents for farms, and by complying with absurd leases, have been the means of driving capitalists out of agriculture. And why? because they cannot realize nearly the amount of interest there that they can in any other business; and their energies and independence are fettered.—I am acquainted with but few farmers who commenced business with competency to manage a good farm and educate their family, who are bringing their sons up as farmers; and for this reason—they find that other men who set out in life about the same time, with the same amount of capital, either professionally or in business of any other kind, have done much better than themselves; and at the same time have enjoyed more of the good things of this life. Surely, then, it may be said this clause is prejudicial to the agricultural interest, since it deprives it of two things so essential to its prosperity—intelligence and capital; and, by the joint application of these, land would rapidly increase in value—that which is now dear would become cheap, a greater number of labourers would be employed, and this country would feed its inhabitants.

*Grass land not to be broken.*—Much land that is laid down for permanent pasture becomes quite unprofitable, which, if cultivated, would produce more beef and mutton than it does at present, and in addition good crops of corn; besides, it would afford employment for the husbandman in his native country, instead of being compelled, as he now is, to seek employment in a foreign clime. Land, cultivated to produce good crops of corn, should not be laid down for permanent pasture, except under peculiar circumstances, such as pleasure-grounds overshadowed by timber, or in the neighbourhood of large towns. Most leases that have come under my notice bind tenants to let their arable land remain a certain number of years in Grass after taking a corn crop, and this clause has also a very prejudicial effect. The best farmers may sometimes fail in producing good crops of Grass, especially Clover, in consequence of dry seasons and various other causes; and it is impossible in some unfavourable seasons to clean land. Yet the tenant is bound to let it remain a certain time out of tillage, irrespective of its condition, and during that time the land is frequently unprofitable in every sense of the word; for if land is not left out clean with a good floor of Grass, it is sure to become full of weeds, which will materially injure the succeeding corn crop. Besides, it will not produce much pasture, or keep much cattle, from whence profit should arise; and the decomposition of plants with the excrements of cattle are the life and soul of corn crops. Hence the absurdity of this clause. Tenants should be at liberty to till their farms as they think proper; then, under such unfavourable circumstances, they would immediately break up their foul, unproductive land; and let that which is clean remain a longer time in Grass. It is a mistake to fancy that tenants would take advantage of this and rack the land. Look to Norfolk and other districts where the arable land is always kept in tillage, for example, and I am persuaded that the principal part of the arable land in this county ought always to be kept in tillage, because it will not produce Grass; yet, by the application of artificial manure, it would yield abundant crops of Turnips, Rape, &c.

*Manure, when land is broken up from Grass.*—Leases generally in this county bind tenants to lay on every acre of land indiscriminately a certain quantity of lime or sand. It matters not what are the principal constituents of the soil, or in what condition it is found. Lime is undoubtedly of great service to some land; nay, indispensable to its profitable cultivation; but vast quantities are annually wasted by applying it to land where, instead of increasing its fertility, it has a contrary effect. It is a mistake to fancy lime is a landlords' manure; that it enriches the soil, or that tenants can enrich themselves, without well manuring the land. Since tenants generally are not capable of analysing the soil, they should be at liberty to use what manure they think proper; if that was the case, we should not hear them saying (as we now frequently do), that they have never applied any foreign manure but lime or sand; and that they have never proved whether they are of any service or not, because they are bound by their lease to apply that, therefore they cannot afford to purchase any more; but every one would prove what manure was best adapted to his respective soil. Then he would soon discover that the more he applied of it, the greater profit he would derive from its cultivation.

*Game.*—Leases generally reserve for landlords a right to stock their land with game to any extent, and liberty to destroy it in any way they think proper, without making the tenant any compensation for the damage; while, at the same time, they bind the tenant to pay the rent, tithe, rates, and taxes. Though the landlord has the power to destroy all his crops with game, the tenant dares not touch one of them. I have often thought farmers are the only class of persons that could be induced to submit to such absurdities. If landlords wish to preserve game, there is nothing to prevent them, but certainly they should be answerable to tenants for the damage done to their crops; and if they were to pay only a reasonable amount of damages, they would soon discover game was too costly to preserve to any extent. It is repugnant to common sense for tenants to lay out their money to improve land under such circumstances; and in this country there are thousands of acres of good land left uncultivated for the sake of game, and as much more that is not half cultivated, because they would destroy its crop; and landlords lose many spirited, enterprising farmers (for such persons will not take farms near game preserves at any price), feeling satisfied that disputes would arise between their landlords and themselves, when they must bid adieu to prosperity. The neighbourhood is thereby deprived of good examples, and labourers of good employers; rates and taxes are considerably increased by the Game-laws, and the means of defraying them curtailed; for be it remembered that while the burdens on an improving farm become light, on one that remains unimproved they become more burthensome, and that these unimproved farms increase the general amount of rates, because they do not employ a sufficient number of labourers. I have explained a few of the evils arising from the preservation of game; but what a dark catalogue remains untold of the innocent blood it has shed, the murders committed, of the distress and anguish of the fatherless and widows, which is frequently increased by being sent from their once happy home to some union house, of the separation of those who have been long united in the bonds of affection, of the jails filled with innocent victims (and notice that in Spalding jail at this time nearly half the prisoners have been committed for offences against the Game-laws), of the thousands of felons and paupers produced by means of contamination; and last, though not least, the expenses of maintaining them in idleness and unprofitable employment, which is a very great hardship on the industrious classes.

I will now submit for your consideration the outlines of a lease of my own construction, which I believe to be calculated to promote agricultural improvements to a very great extent, far beyond any one's conception at first sight. If such leases were generally adopted, they would decide that important question which has so long engaged the public mind, namely, tenant right; and I cannot conceive what objection landlords can have to the granting of leases, since their interests, and that of their tenantry in that respect, are identified. I believe it is impossible for the legislature to frame a bill that

would administer justice generally, either to landlords or tenants—the situations of farms, and circumstances connected with them, being so diverse. Land should be let on progressive principles, with corn rents, which would justify and encourage tenants to improve the land, and give landlords an opportunity of participating in the improvement. On letting a farm the average price of Wheat for the last seven years should be ascertained. It should first be let for 21 years, at a rent then to be agreed on for the first seven years; the rent of every successive seven years to be governed by the price of Wheat during the seven preceding years. At the expiration of every seven years, if landlord and tenant agree, a fresh valuation should be made of the farm, and another seven years added to the term; but should not that addition be made, the tenant would then have 14 years' notice to quit, when, of course, he would discontinue his improvements; but he should not be allowed to rack, or reduce the land from its improved condition because he has 14 years' interest therein, sufficient time to reimburse himself. Now I will suppose a farm of 100 acres to be let as before mentioned for a term of 21 years. It is ascertained that the average price of Wheat the preceding seven years has been 20*s.* the Cornish bushel, therefore the tenant agrees to pay 100*l.* per annum for the first seven years of the term. If the price of Wheat the first seven years should prove to be 21*s.* the bushel, then for the second seven years the tenant would have to pay 110*l.* per annum; or should it prove to have been but 19*s.*, the tenant would have to pay 90*l.*, and so on, for the increase or decrease of every shilling on the Cornish bushel of Wheat, the rent should increase or decrease 10*l.* per cent. per annum. I think it right to extend the average over seven years, in order to prevent great fluctuations, which would be very inconvenient to landlords and tenants. This farm of 100 acres is let for 21 years at the rate of 100*l.* per annum for the first seven years. If at the end of the first seven years the landlord and tenant cannot agree on the rent for a fresh seven years to be added to the term, arbitrators and their umpire shall be chosen in the usual way, and they shall fix the rent, being governed in fixing the rent by the price of Wheat the previous seven years; indeed, all matters that cannot be agreed on by landlord and tenant, shall be decided by arbitration in the usual way. The landlord to lay out all money necessary for permanent improvements; to take the green crops and hay grown on the farm the last year of the term; to be at liberty to work mines and quarries by paying the tenant for damage done; to pay the tenant for damage done by game; to pay the tenant 1*s.* per annum for every tree growing on the hedges after it becomes 10 years old. Here I would remark, if the tree is not worth to the landlord more than 1*s.* per annum it should not stand, because it will do the tenant more than that amount of damage; and further, if landlords wish to gratify their eye with timber, there is nothing to prevent them, but it must not be grown at the tenant's expense. The landlord or his agent shall at all times be at liberty to view the farm, and if at any time they consider that the tenant, from mismanagement or neglect, is injuring it, they shall be at liberty to call in arbitrators; and should they agree that the farm is injured, they shall fix the amount of damage, which amount shall be immediately paid by the tenant with all expenses attending the said arbitration; but should they fail to prove damages, then the landlord shall pay all expenses attending the said arbitration. In case of the death of the tenant, the landlord shall take possession of the farm, and pay his heir or executors his interest therein. The tenant shall keep the premises in good repair, it first being put in that state by the landlord; shall insure the buildings against fire; shall pay his rent half yearly; and all tithe, rates, and taxes, when they are demanded; shall be at liberty to manure and manage the farm during the term in any way he thinks proper, provided he does not injure it; and should he at any time from neglect cause the renting value of the farm to diminish, he shall pay the landlord the full amount of damage. The tenant shall pay the landlord 1*l.* per cent. per annum more for all money expended by him in permanent improvements, than it could be borrowed for on land security.

This, Sir, is a rough sketch of a lease of my construction, which, according to custom, is very lengthy, too much so to occupy our time this evening; though, I believe, it might be condensed into very few words. In conclusion, I will explain some of the advantages likely to accrue from this lease, and contrast them with our existing leases, and I do not know any better way of explaining it than by stating how I stand affected at present; and how I should act, if under such a lease as I have just given you a sketch of. I would first remark with regard to my lease, it lies unnoticed on "the shelf;" but this I know, that my term extends to 15 years only. I manage the farm in every respect as I think proper, and I do not complain of game, or timber, or any interference; but what I complain of is that I am not justified in continuing my improvements. I have occupied Trescow Farm eight years, and in that time have greatly improved it; and in making these improvements I have felt great pleasure, though as yet they have proved unprofitable. But now, having seven years only remaining of my term, I do not feel justified in continuing my improvements, from the uncertainty of my tenure. If I were to continue them to the end of my term, the probability is that the steward would be sent to value the farm, and it would be his duty to state what he considers it would let at, if offered to the public; and if I took it again, I should have immediately to pay for my improvements; and if I should leave it, I must of necessity leave much capital locked up in the soil—therefore I find it necessary henceforth to cease my improvements. Consequently I shall be doing "penance" for the next seven years, whether Popery prevails in England or not; because farming is my hobby, and agricultural improvements afford me the greatest pleasure and satisfaction; and to improvements we must look for profits: and, further, I am not justified in continuing to improve the farm; for, in the absence of a corn rent, if present prices of agricultural produce continue, I shall not long be able to hold possession of the farm. But what would be my position at present, if holding the farm under my proposed lease? I should have improved it considerably more than I have at present; should have applied to my landlord, and have had great improvements made in the farm buildings; should also have had much land drained; and these improvements, in connection with others made by myself in the general condition of the farm, would have assisted me to stem the present difficulties; and, though my rent for the next seven years would not be reduced more than about 10*l.* per cent., still I should be justified and encouraged to continue my improvements, knowing that if the present prices for agricultural produce continue, my rent, for the following seven years, must be reduced considerably; and it is well known to every practical agriculturist how much more profitable it is to cultivate land in high condition than in low; it being attended with less expense, while its produce is generally one-third greater. Now what effect would my lease have on landlords? Why in 14 years their land would increase in value 25 per cent. They would, in addition, receive 1 per cent. profit, on all money expended on their land; nay, I believe, 2 per cent. more than if laid out in purchasing land, afterwards to remain unimproved, as is too often the case. They would have power to dispossess all bad tenants—those that would not improve their land—which is their duty. No person should be allowed to occupy land in this country, which is so thickly populated, who does not endeavour to make it produce the greatest possible amount of food and labour; and I am satisfied if landowners generally could see as clearly as I do, the tendency this lease has to foster that, and the improvement of their land, they would immediately adopt it. There is one objection I have heard raised by some landlords and tenants; they consider the variation of 10 per cent. on the rent, for every one shilling fluctuation on the bushel of Wheat, to be too great; but that objection might be removed by varying half the amount, which would be equal to the Scotch principle of corn-rent. But I contend that the landlord is the proper person to take the consequence of the fluctuation in the price of agricultural produce. Then the variation of rent should be 10*l.* per cent. If landlords were to take the responsibility on themselves, I am persuaded they would receive the highest rent for their land. It is frequently said land should be let on mercantile principles; and what is meant by that? I consider mercantile principles to be the realisation of a certain profit after paying expenses, and land should be let on those principles. Then tenants would be able to make their calculations on taking a farm with corn at a certain price, what rent they could pay and realise a profit. They would then be justified and encouraged to improve the farm, since their extra profit would depend on their skill.

METEOROLOGICAL REPORT.—April.

‡ Continuation of preceding storm.
* This is also a storm travelling northward over central Europe, and passing away over Russia.
† Another storm of the same description as the preceding one.

These three storms ‡ * † would probably cause strong northerly and westerly winds to vessels in the latitude of Madeira, but along the coast of France and the entrance of the Channel, a succession of baffling easterly winds.

Dorchester, April 16th. *F. P. B. M.*

(*To be continued.*)

## Miscellaneous.

*Early Spring Food.*—There is at present being cut for house feeding, a field of Italian Rye-grass, on Mr. Camon's farm, at Kirronrae, in Wigtownshire. It was sown after Vetches last season, and is already (7th April) 27 inches in length, a heavy and abundant crop. The earliness of this crop is the more remarkable, as the farm, though favourably situated for climate, has none of those appliances which have rendered Myre-mill so celebrated. It is highly creditable to the skill and good management of the tenant, and though grown in a latitude of 55°, it may probably challenge comparison with any crop of the same kind in the warmer south.

*Incombustible Thatch.*—Straw saturated with a solution of lime or common whitewash has, it is said, been repeatedly proved to be not only fireproof, but more durable than the ordinary thatch. *Builder, April 5.*

## Notices to Correspondents.

To Correspondents. The delay of some answers will perhaps be excused by the illness of the Editor.

Cake: *A B.* If the sheep have been accustomed to it they will readily take it when on Grass, which their manure will improve. The ewes and lambs may be folded on poor Clover without injury, provided, by other means, you give them food enough.

Essex Breed of Pigs: *F.* Excepting the gentleman already named, we are not acquainted with any breeder of Essex pigs. An advertisement will find what you want.

Greenstones: *Lammerlaw.* Nos. 10 and 11 appear to be granite and gneiss respectively; the others appear to be greenstone.

Heavy Land just ploughed out of Grass: *J E G.* On the part liable to be flooded you want some strongly-growing plant. Try Rape plants, transplanted in June.

Pigeons: *T C W.* We must in the meantime refer inquirers on this subject to a work by the Rev. E. S. Dixon, about to be published by Mr. Murray.

To Purify Water: *J E G.* Throw in a cart load or two of freshly-burned charcoal. That might be a remedy.

Turnips. If your land is in good tilth, set a couple of men, walking backwards, each to his own bed of ground, to hoe holes at intervals of 18 inches all over the land. Let them be followed by women with baskets of superphosphate, who shall throw a handful into each hole, and then by women with rakes, who cover the holes up, making, however, an indentation on the top of each with the back of the rake, sufficient to guide a child, who follows with a canister of seed, and shakes a little into each, covering it up with his foot. An old tin powder-canister, with a quill inserted in the cork, is as good a thing as can be used, and put just a little whiting in with the seed. They will be whitened, and the boy will *see* what he is about. For your vegetable soil we should prefer superphosphate to guano.

Work of Reference: *A S.* Some of the Cyclopedias; and, as being the latest and most original of the series, Blackie's ought to be the best.

Errata.—Osiers: *J E G.* Thanks. For "3 feet by 2 inches," in page 221, col. *c*, read 3 feet by 2 *feet*.—In the Durham letter of the *Times* correspondent, part of which was published at page 238, *for* "34,000 superficial feet of 1-inch deal at 12*s.* per 1000," *read* "3400 at 12*s.* per 100."

## Markets.

COVENT GARDEN, April 19.

Hothouse Grapes, both white and black, are becoming more plentiful, and, considering the little sunshine we have had they are exceedingly well flavoured. Good Pine-apples are scarce, as are also dessert Apples. Oranges and Lemons are plentiful. Nuts remain nearly the same as last week. Forced Strawberries are more plentiful. Vegetables of all kinds are abundant and good. French Beans and Cucumbers are plentiful. Carrots and Turnips are good in quality. New Cornish Potatoes may be obtained at from 1*s.* to 2*s.* per pound. Lettuces and other salading are sufficient for the demand. The best Mushrooms fetch 1*s.* 3*d.* per pottle. Cut flowers consist of Heaths, Pelargoniums, Camellias, Mignonette, Double Primroses, Stephanotis floribunda, Cinerarias, Moss and Provins Roses, and the different kinds of spring bulbs.

FRUIT.

| | |
|---|---|
| Pine-apples, per lb., 6*s* to 10*s* | Oranges, per doz., 9*d* to 2*s* |
| Grapes, hothouse, p.lb., 12*s* to 24*s* | — per 100, 6*s* to 14*s* |
| — Portugal, p.lb., 1*s* to 2*s*6*d* | — Seville. p. 100, 7*s* to 14*s* |
| Strawberries, per oz., 9*d* to 2*s* | — — p. doz., 1*s* to 2*s* 6*d* |
| Pears, per doz., 2*s* to 5*s* | Lemons, per doz., 1*s* to 2*s* |
| — per half sieve, 6*s* to 15*s* | Chestnuts, per peck, 2*s* to 5*s* |
| Apples, dessert, p.bush., 6*s* to 10*s* | — per 100, 9*d* to 1*s* 6*d* |
| — kitchen do., 5*s* to 8*s* | Nuts, Barcelona, p. bsh, 20*s* to 22*s* |
| Almonds, per peck, 6*s* | — Brazil, p, bsh., 12*s* to 14*s* |
| — sweet, per lb., 2*s* to 3*s* | Cobs, per 100 lbs., 70*s* to 75*s* |

VEGETABLES.

| | |
|---|---|
| Brussels Sprouts, p. hf. sieve, 1*s* to 1*s* 6*d* | Shallots, per lb., 6*d* to 1*s* |
| Cabbages, per doz., 1*s* to 1*s* 6*d* | Garlic, per lb., 4*d* to 8*d* |
| Greens, p. doz. bunches, 4*s* to 6*s* | Artichokes, Jerusalem. p. half sieve, 1*s* to 1*s* 6*d* |
| Cauliflowers, p. doz., 1*s* 6*d* to 4*s* | Lettuce, Cab., p. score, 6*d* to 9*d* |
| Broccoli, p. doz. bundl., 7*s* to 12*s* | — Cos, per score, 1*s* to 1*s*6*d* |
| French Beans, p.100, 1*s*6*d* to 2*s*6*d* | Endive, per score, 1*s* to 1*s* 6*d* |
| Seakale, per punnet, 6*d* to 2*s* | Small Salads, p. punn., 2*d* to 3*d* |
| Asparagus, per 100, 4*s* to 10*s* | Horse Radish, p. bundl., 1*s* to 4*s* |
| Rhubarb, p. bundl., 6*d* to 1*s* 2*d* | Red Beet, per doz., 6*d* to 1*s* |
| Potatoes, per ton, 60*s* to 100 | Mushrooms, p. pot., 9*d* to 1*s* 3*d* |
| — per cwt., 3*s* to 6*s* | Sorrel, per hf. sieve, 6*d* to 9*d* |
| — per bush., 1*s* 6*d* to 3*s* | Fennel, per bunch, 2*d* to 3*d* |
| Turnips, p. doz. bundl., 1*s* to 2*s* | Savory, per bunch, 2*d* to 3*d* |
| Cucumbers, each, 1*s* to 3*s* | Thyme, per bunch, 2*d* to 3*d* |
| Radishes, per doz., 1*s* to 1*s* 6*d* | Parsley, per doz. bun., 2*s* to 3*s* |
| Celery, p. bundle, 6*d* to 1*s* 6*d* | — Roots, p. bundl. 9*d* to 1*s* |
| Carrots, per doz., 2*s* to 5*s* | Marjoram, per bunch, 2*d* to 4*d* |
| Spinach, per sieve, 1*s* to 1*s* 6*d* | Mint, green, per bunch, 4*d* to 6*d* |
| Onions, p. bunch, 3*d* to 4*d* | Watercress, p.12 bunch., 6*d* to 9*d* |
| — Spanish, p. doz., 1*s*6*d* to 4*s* | Corn Salad, p.hf. sieve, 1*s* to 1*s*6*d* |

COAL MARKET.—Wednesday, April 16.

Carr's Hartley, 14*s.* 3*d.*; Eden Main, 15*s.*; Tanfield Moor, 13*s.* 6*d.*; Wallsend Riddell, 14*s.*; Wallsend Haswell, 16*s.*; Wallsend Hetton, 15*s.* 9*d.*; Wallsend Lambton, 15*s.* 6*d.*; Wallsend Stewarts, 15*s.* 9*d.*; Wallsend Adelaide Tees, 15*s.* 3*d.*; Wallsend Tees, 15*s.* 9*d.*—Ships at market, 150.

POTATOES.—Southwark, April 14.

The Committee report that the fresh arrivals have been limited, but quite equal to the demand, which is very dull.

The following are the quotations:—York Regents, per ton, 80s. to 90s.; Scotch do., 70s. to 80s; ditto Cups, 60s. to 70s.; Cambridgeshire and Lincolnshire Regents, 60s. to 80s., French whites, 50s. to 60s.

SMITHFIELD, Monday, April 14.

There are not quite so many Beasts as of late; however, the supply is fully adequate to the demand, and prices are no better. We have a larger number of Sheep; trade is exceedingly dull at lower prices. There is a demand for choice Lambs; in a few instances rather over 6s. is obtained. Good Calves are still in request, but for other kinds trade is very bad. From Holland and Germany there are 333 Beasts, 630 Sheep, 60 Calves, and 70 Pigs; from Norfolk and Suffolk, 2300 Beasts; from Scotland, 300; and 100 from the northern and midland counties.

| Per st. of 8 lbs.—s | d | s | d | Per st. of 8 lbs.—s | d | s | d |
|---|---|---|---|---|---|---|---|
| Best Scots, Hereford, &c. | 3 6 | to 3 | 8 | Best Long-wools | 3 8 | to 4 | 0 |
| Best Short-horns | 3 4 | — 3 | 6 | Ditto Shorn | 3 4 | — 3 | 8 |
| 2d quality Beasts | 2 6 | — 3 | 0 | Ewes & 2d quality | 3 4 | — 3 | 8 |

| Ditto Shorn | 3 10 | — 4 | 0 | Lambs | 5 0 | — 6 | 0 |
| | | | | Calves | 3 0 | — 4 | 4 |
| | | | | Pigs | 2 8 | — 3 | 8 |

Beasts, 3753; Sheep and Lambs, 23,770; Calves, 158; Pigs, 410.

Friday, April 18.

Although the number of Beasts is not very large, several remain unsold; notwithstanding there is a disposition to take lower prices. The number of Sheep is moderate, but the trade is so depressed that they cannot all be disposed of. This being Good Friday, Lamb is the principal article in demand. There are not so many as on former occasions; however, trade is excessively dull, prices are lower, and many remain unsold. From Germany and Holland we have 93 Beasts, 270 Sheep, and 266 Calves; from Scotland, 50 Beasts; from Norfolk and Suffolk, 260; and 80 milch cows from the home counties.

Beasts, 585; Sheep and Lambs, 8380; Calves, 451; Pigs, 200.

MARK LANE.

Monday, April 14.—The supply of English Wheat at market this morning was only moderate, and the offers from the coast were likewise to a limited extent; the trade, nevertheless ruled dull, and the rates of Monday last were maintained with difficulty. Transactions in foreign were of a retail character, at late rates. Barley was in short supply, and the quotations of this day se'nnight were supported. The arrivals of foreign Oats during the past week exceeded 30,200 qrs. The market having previously been rather bare of supply, factors succeeded in maintaining previous rates. The large dealers, however, refrained from purchasing, in the expectation of being able to buy on easier terms towards the expiration of the vessels' lay-days. Beans and Peas were quite as dear. Clover seed was rather more inquired for, and last week's prices were in some cases rather exceeded.

Wednesday, April 16. — There was scarcely any English Wheat fresh up for this morning's market, and the few parcels left over from Monday were disposed of at about that day's quotations. The transactions in foreign Wheat were unimportant, and its value was unchanged. French Flour sold in retail at former prices. Barley was in short supply, and fully as dear. There was a steady sale for Oats, and the dealers were unable to purchase on any easier terms than before. Beans and Peas in limited request at late rates.

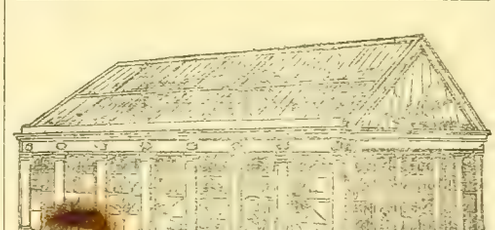
Liverpool, Tuesday, April 15.—The arrivals here since last Tuesday from Ireland and coastwise are moderate of Oats, Oatmeal and Malt, but light of other articles. From foreign ports we have received a large supply of Flour, but the imports are trifling of other articles. At this day's market there was a fair attendance of dealers, who purchased to a moderate extent of Wheat and Flour, at a decline of 1d. to 2d. per 70 lbs., and 6d. to 1s. per sack and barrel. Oats and Oatmeal met a slow sale, at last week's prices. Barley, Beans, and Peas without change in value. Indian Corn met a fair inquiry, but holders demanding extreme prices, little business resulted.

——Friday, April 11.—The arrivals since Tuesday of French Flour are large, and of other articles moderate. At this morning's market the demand for Wheat and Flour was slow, and Tuesday's quotations gave way 1d. per bushel on the former, and 6d. per sack and barrel on Flour. There was not much doing in Indian Corn, but it was firmly held. Mealing Oats were scarce, and improved 3d. per bushel. Egyptian Beans likewise advanced 3d. to 6d. per qr. Barley and Peas supported late rates.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.
WARRANTED BEST MATERIALS AND WORKMANSHIP, AT THE LOWEST POSSIBLE PRICES.

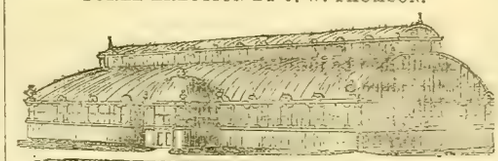


J. WEEKS and CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. Weeks and Co., King's-road, Chelsea, London.



GRAY and ORMSON, Danvers-street, Chelsea, solicit the attention of the Nobility, Gentry, and Gardeners, to their superior manner of Erecting and Heating every description of Building connected with Horticulture. The work done by them at the Right Hon. the Earl of Kilmorey's, to which they have had the honour of referring so long, still continues to give perfect satisfaction. Mr. Kinghorn will be happy to show the work and give any information.

They also beg to refer to the houses built by them during the past season, for the Worshipful Apothecaries' Company of London, in their Botanic Garden at Chelsea. Mr. Moore, the Curator, will kindly show the work, and answer any inquiries. They beg also to say the Building only is referred to, as the Heating Apparatus was not erected by them.

Gray and Ormson have also the honour of referring to many of the nobility and gentry in the country, and to several of the London nurseries.

N.B. Plans and Estimates furnished free.

DESIGNS FOR EVERY DESCRIPTION OF HORTICULTURAL ERECTION BY J. W. THOMSON.

EVERY KIND OF HORTICULTURAL STRUCTURE Designed, Erected, and Heated by Hot Water common Flues, and other modes, on the most economical and improved modern principles. Testimonials and references from Noblemen and Gentlemen who have kindly patronised, for more than 15 years past, J. W. THOMSON'S modern and simple mode of Constructing, Building, Warming, and Ventilating Garden Structures.

J. W. Thomson having had full 25 years' experience as a practical Horticulturist, Landscape Gardener, and Garden Architect, in her Majesty's Royal Gardens at Windsor, Kew, and other places, most respectfully solicits the favours and patronage of Noblemen and Gentlemen about to form new or to alter and embellish their present Parks, Gardens, &c.

Plans and Estimates for remodelling Parks and Gardens, or for Building and Heating Hothouses, and other Garden improvements, furnished on application. Melon and Cucumber Boxes and Lights, Rustic Summer-houses, Chairs, Vases, and similar Garden Ornaments made on the shortest notice.

15,000 FLOWERING PLANTS OF CRASSULA COCCINEA MAJOR for Sale, well set with spikes of Flowers, in pots from 4 to 18 inches in diameter, and with flowering heads varying in number from one to one hundred on a plant. This is a very desirable plant for bedding, and flowering plants can be supplied from 4s. per dozen to four guineas per plant, on application to J. W. Thomson, Nurseryman and Hothouse Builder, Exotic Nursery, Hammersmith, Middlesex.

ALLSOPP'S EAST INDIA PALE AND OTHER BURTON ALES.—The Public is respectfully informed, that these favourite Ales may be had genuine, in casks of 18 gallons and upwards, at their respective stores, as under, where also a list of the bottlers may be obtained.

The Brewery, Burton-on-Trent; Stores, 61, King-William-street, City, London; Cook-street, Liverpool; High-street, Birmingham. The Exchange, Manchester, 23, Virginia-street, Glasgow.

STEPHENSON and Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

THE LANDOWNERS' WEST OF ENGLAND AND SOUTH WALES LAND DRAINAGE AND INCLOSURE COMPANY. Incorporated by Act of Parliament.

At the HALF YEARLY GENERAL MEETING, held the 10th of April, 1851, at the Company's Office, Bedford Circus, William Porter, Esq., in the chair, the following Report of the Directors was read, viz.:

"Your Directors have much pleasure in reporting,

"That the operations of the Company are now greatly enlarging.

"That the Acreage drained within the last six months has been increased by more than two-thirds beyond that of the corresponding period last year, and far exceeding that of any previous year.

"The Acreage now in course of Drainage, and for which surveys and proposals have been made, amounts to about 40,000 acres.

"These very favourable results, arising from the means adopted by your Directors for the progression of the Company and the establishment of the London Office, are highly satisfactory.

"From the Auditors' Report of the affairs of the Company, your Directors are enabled to recommend a payment to the Shareholders, on account of Dividend, at the rate of Five per cent. per annum, for the Half Year ending 28th February last, carrying off a considerable balance to the reserve Fund.

Resolved—

"That a payment at the rate of Five per cent. per annum be made to the Shareholders, free of Income-tax, on the 10th of May next. And the Surplus Profit reserved for the Annual Meeting in October." (Signed) Thomas May, Secretary.

ANTHONY'S PATENT AMERICAN CHURN.—In addition to the numerous testimonials already published, the following one has just been received:

"Huntingdon, April 14th, 1851.

"Gentlemen,—About a year ago I purchased of you one of Anthony's Double-Acting American Churns. My small dairy was then managed by a very obstinate servant, who hated novelties, and you are well aware that I was at first much disappointed with it; but I have now great pleasure, after some experience of the merits of the Churn, in adding my testimony to its great value.

"Instead of my servant being put out of temper as heretofore by turning the old-fashioned barrel churn from half an hour at least to sometimes an hour and a half, and being surprised with bad butter as the result of all her labour, I now can depend upon obtaining first-rate butter in 10 or 12 minutes. No dairyman ought to be without such a churn, and you are quite at liberty to make what use you please of this letter.

"I am, Gentlemen, yours obedient y, Chas. Margetts.

"To Messrs. Key and Co."

For prices and further testimonials, apply to the Depôt, 103, Newgate-street, London.

FIRE ANNIHILATOR, PHILLIPS'S PATENT.

Copy of a letter addressed by W. Bates, jun., Esq., to Mr. Phillips, the Patentee and Superintendent of the Fire Annihilator Company:—

"Zara-street Mills, Manchester, 2d April, 1851.

"Sir,—We have much pleasure in adding our testimony to the great value of your invention—the Fire Annihilator. Owing to the great heat required in the manufacture of our goods, and the consequent liability of the materials to ignite, the insurance offices have always refused to insure our premises, even at the rates paid for the most hazardous trades; now, however, we consider ourselves perfectly safe, for in addition to your apparatus, we have both steam and water conveyed in pipes to all parts of the building; but we consider the Annihilator will be able to put out any fire that may hereafter occur. One that took place in January last was put out in about five minutes, by three charges (although it spread, with the rapidity of gunpowder, a distance of 150 feet), and the men were enabled to resume work in an hour afterwards. Two other very great advantages the Annihilator possesses: the vapour enables persons to breathe in the room where the fire is, and the apparatus can be used without causing the least damage to the machinery, as is the case with both steam and water. From the experience we have had of the invention, we have no hesitation in saying that even the Portable Machines will be found sufficient to extinguish any fire, if applied immediately on its outbreak.

"We are, sir, yours respectfully,

"Per pro the Imperial Patent Wadding Company,
(Signed) "William Bates, Jun., Manager.

"W. H. Phillips, Esq., London.

"P.S. You are at liberty to make what use you please of this letter."

*** The Portable Machines used were three of size No. 4.

Prices of machines, 2l. 2s., 3l. 4l., 7l., 6l., and larger hand machines, and street and stationary engines (machines of continuous power) to order. A demonstration will take place at the London Gas Works, Vauxhall, on Friday, the 25th inst., at 4 o'clock, P.M. precisely. Orders of admission, prospectuses, testimonials, and every further information may be obtained of the Secretary, at the office of the Company, 105, Leadenhall-street, City.

THE METALLIC PAINT, produced by the Patent Alkali Company, has been extensively used for several years on farm-buildings, iron fences, roofs and railings, shipping, &c., and it is admitted that it covers a greater surface and stands far better than any other pigment on wood, iron, Aberthaw Lime, and Roman Cement. Fine Black, 25l. per ton, and Rich Purple-brown, 28l. per ton.—Offices of the Company, 1, New Broad-street, London.—John A. West, Secretary.

LINGHAM BROTHERS, 170, Hampton-street, Birmingham, sole Manufacturers of the improved WOOD and ZINC MENOGRAPH, or Label for Garden Borders Flower-pots, &c., in boxes of 1:0, &c. The Zinc Labels are highly approved of for their lasting durability; can be written upon with the greatest ease, and, when dry, a permanent inscription is secured. Directions for use sent with each box, including bottle of Metallic Ink.

Sole Agents in London, G. and J. Deane, Horticultural Implement Warehouse, 46, King William-street, London Bridge.

*SALES BY AUCTION.*

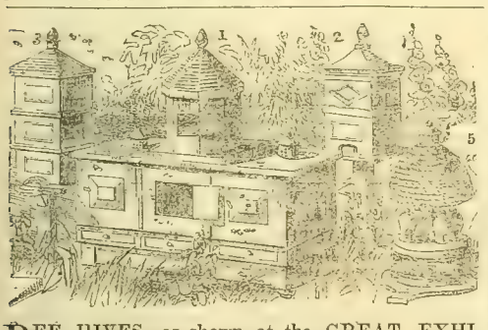
TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew-lane, on WEDNESDAY, April 23, and THURSDAY, 24th, at 12 o'clock each day, a first class collection of Carnations and Picotees, Pinks, and Auriculas; also Dahlias in dry roots, Geraniums, Chrysanthemums, Fuchsias, Verbenas, Climbing and other Roses, in pots, &c. May be viewed morning of sale.—Catalogues had at the Mart; and of the Auctioneers, Leytonstone, Essex.

FURNITURE.—REMOVED FOR CONVENIENCE OF SALE TO THE "RED COW," DALSTON.

MESSRS. PROTHEROE AND MORRIS will submit to public competition by Auction, at 12 o'clock on TUESDAY, April 22d, an extensive variety of Bed-room Furniture, Winged and Plain Wardrobes, Drawing-room Furniture, 6½ Octave Cottage Pianoforte, Dining, Loo, and other Tables, Chairs of varied character, Sporting and other Prints, and an assemblage of useful and ornamental articles, a small cellar of Wines, and numerous effects.—May be viewed the day previous to the sale, and Catalogues had at the "Red Cow," Dalston; and of the Auctioneers, Leytonstone, Essex.

THE MOST SUPERB BED OF TULIPS IN EUROPE.



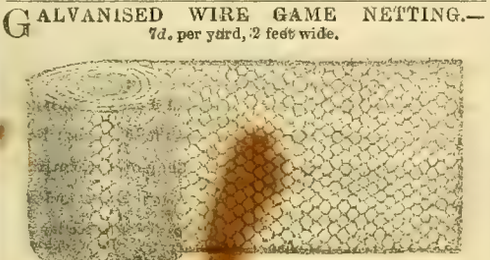
MR. R. LAWRENCE, of Hampton, will sell his unrivalled bed of TULIPS, of the splendour of which some idea may be formed by the number of fine varieties: viz. 30 Louis XVI., 16 Musidora, 12 Pompe Funebre, 12 Fabius, from 4 to 10 each of Bysantium, Pandora, Parmigiano, Brown's Polyphemus, ditto Ulysses, Dicken's Duke of Devonshire, Marcellus, Rose Arlette, Lyde's Queen of Hearts, Brown's Magnificent, Strong's King, Nora Criena, Thalia, Vivid. Besides several each of Leo, Coronation, Iago, Apelles, Salvator Rosa, Lord Collingwood, Marshal Soult, Selim, Groom's Queen Adelaide, Lady Exeter, Laura Lawrence, Hepworth's Queen of the North, Dutch Ponceau, Goldham's Maria, Brown's Sylvia, Jeffrey's Elizabeth, La Belle, Nanette, Lawrence's Lady Sale, and nearly every flower that has been raised worth cultivation, by Lawrence, Clarke, Lyde, Dixon, Strong, Walker, Glenny, Goldham, Brown, Groom, &c. Persons desirous of receiving Catalogues, may send their addresses to Mr. R. LAWRENCE, Red Lion, Hampton (where the bed may be seen, from the 1st of May to the day of sale); Mr. LOCKHART, 84, Fleet-street; and Mr. GLENNY, Strand. Catalogues will also be forwarded to the principal Seedshops.

FOR PUBLIC SALE, at the New Corn Exchange Tavern, Mark-lane, on MONDAY, 28th April, at 2 o'clock precisely, about 350 Tons GUANO, imported from Valparaiso.—Catalogues and further particulars in due time from J. A. RUCKER and BENCRAFT, Brokers, 26, Commercial Sale Rooms, Mincing-lane, London.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

TO BE LET, on moderate terms, a NURSERY GARDEN, with a comfortable House, Green and Hothouses, and about an acre of land, with a very improving business, and good neighbourhood, situated close to a market town, and within a few miles of other good market towns. Tenancy to commence at Michaelmas next; or, if required, arrangements could be made for immediate possession.—For further particulars, apply to A. Z., Office of this Paper.

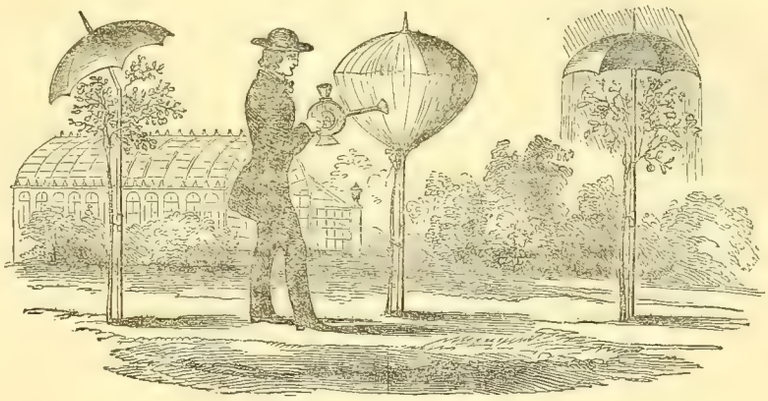


BEE HIVES, as shown at the GREAT EXHIBITION of 1851, by GEO. NEIGHBOUR and SON, 127, High Holborn, London. No. 1, Nutt's Collateral Hive; 2, Improved Single Box-Hive; 3, Taylor's Amateur Bar-Hive; 5, NEIGHBOUR's Improved Cottage Hive, working three or five Glasses; the Ladies Observatory Hive, &c. &c.

A priced Catalogue, with drawings and particulars, forwarded on receipt of two postage stamps.

AGENTS.—Liverpool: Wm. Drury, Castle-street. Manchester: Hall and Wilson, 50, King-street. Glasgow: Austin and M'Aslin, 168, Trongate.

GALVANISED WIRE GAME NETTING.—*7d.* per yard, 2 feet wide.



| | | | Galvanised. | Japanned Iron. |
|---|---|---|---|---|
| 2-inch mesh, light, 24-inch wide | ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch | ,, strong ,, | ... | 9 ,, | 6½ ,, |
| 2-inch | ,, extra strong ,, | ... | 12 ,, | 9 ,, |
| 1½-inch | ,, light ,, | ... | 8 ,, | 6 ,, |
| 1½-inch | ,, strong ,, | ... | 10 ,, | 8 ,, |
| 1½-inch | ,, extra strong ,, | ... | 14 ,, | 11 ,, |

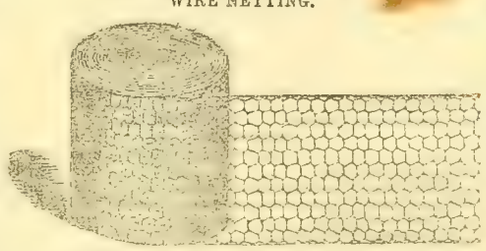
All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

# SANGSTER'S "FLORUMBRA."

REGISTERED FEBRUARY 8TH, 1851.

THIS simple apparatus, besides forming a Flower Shade, is intended to render BROWN'S Patent Fumigator (which is now generally used for smoking Greenhouses and Frames), applicable to Standard Roses, and other plants growing in the open ground. The Florist will thus be enabled to preserve them from the attacks of the Aphis, Worm, and other insects, so destructive to them in the spring, besides promoting their growth, by the application of Tobacco Smoke.



By removing the Bag, the "FLORUMBRA" (as shown in the above drawing), forms a Shade, when the Flowers are in bloom, against the mid-day sun, as well as a protection from the heavy showers which frequently destroy, in a few minutes, the hopes of the Florist for the season, or at least prevent his competing at an approaching exhibition of Flowers.

SANGSTER'S "FLORUMBRA," as well as Brown's Fumigator, may be had wholesale of Messrs. BABBER and GROOM, Holborn-hill, and retail of most Seedsmen and Ironmongers in the Kingdom, and of W. and J. SANGSTER, at their Manufactory, 75, Cheapside. Price of the Florumbra, from 7*s.* 6*d.*, according to size; or as Shades, without the Bag, from 4*s.* each.

TO NURSERYMEN.

TO BE LET, at Camberwell, a NURSERY GROUND, of about three acres, well stocked, with a Dwelling and Shop. It is in a populous neighbourhood, and there is every prospect of a profitable trade.—Apply to Messrs. ELLIS and SON, Estate Agents, 36, Fenchurch-street, London.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG AND COMPANY (LATE W. AND C. YOUNG),

MANUFACTURERS OF IRON AND WIRE WORK, &c.,
22, PARLIAMENT STREET, WESTMINSTER, LONDON;
48, NORTH BRIDGE, EDINBURGH;
22, ST. ENOCH SQUARE, GLASGOW;
1, CASTLE BUILDINGS, DERBY SQUARE, LIVERPOOL;

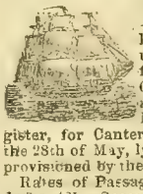
beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

PRICES.—18 ins. high, 9*d.*; 24 ins., 1*s.*; 30 ins., 1*s.* 3*d.*; and 36 ins., 1*s.* 6*d.* per lineal yard.

| | | | | |
|---|---|---|---|---|
| Or a web of 100 yards, 18 ins. wide, will cost | .. | £3 | 15 | 0 |
| Do. of 100 yards, 24 ins. wide | .. .. | 5 | 0 | 0 |
| Do. of 100 yards, 30 ins. wide | .. .. | 6 | 5 | 0 |
| Do. of 100 yards, 36 ins. wide | .. .. | 7 | 10 | 0 |



If more or less than a web is required, it would be charged at the same rate per yard.

This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. YOUNG and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1*s.* is equal to 2½ yards of another article in the market, the same width, at 9*d.* per yard. Samples for inspection sent free of expense.

C. D. YOUNG & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland.

FOR PORT LYTTELTON, CANTERBURY SETTLEMENT, with liberty to land passengers and goods at the under-mentioned Ports in New Zealand, the first-class Passenger Ships, LADY NUGENT, 668 tons Register, for Canterbury, Nelson, and New Plymouth, to sail on the 28th of May; DUKE OF PORTLAND, 533 tons Register, for Canterbury, Wellington, and Auckland, to sail on the 28th of May, lying in the East India Docks, chartered and provisioned by the Canterbury Association.

Rates of Passage:—Chief Cabin, a whole Cabin between decks, 42*l.*; Second Cabin, 25*l.*; Steerage, 16*l.*; Children under 14, one-half. Each ship carries an experienced Surgeon.—For Freight, Passage, or further information, apply to J. STAYNER, 110, Fenchurch-street; FILBY and Co., 157, Fenchurch-street; or to FREDERICK YOUNG, Manager of Shipping for the Canterbury Association, 71, Cornhill.

TO NOBLEMEN and GENTLEMEN who require a plentiful and CONSTANT SUPPLY of PURE WATER to their Country Mansions.

Messrs. EASTON and AMOS beg to offer their improved PATENT HYDRAULIC RAM, which is perfectly self-acting, and without manual labour is capable of lifting water to 30 times the height of the waterfall by which it is worked.

THIS MACHINE CAN BE APPLIED WHEREVER A FALL OF WATER OF A FEW FEET CAN BE OBTAINED; and its cheapness and durability, with the fact that upwards of 500 of them erected in England and other countries by Messrs. EASTON and AMOS have now been at work many years, afford ample proof of its great value and efficiency.

Estimates of the expense of the Machine, Pipes for the conveyance of Water, Tanks, and Reservoirs, may be had on application to Messrs. EASTON and AMOS, CONSULTING ENGINEERS to the ROYAL AGRICULTURAL SOCIETY, at their office in Orange-street, Trafalgar-square, or at the Works in the Grove, Southwark, London.

EMIGRATION TO CANTERBURY, IN NEW ZEALAND.—A LIMITED NUMBER OF ASSISTED PASSAGES in the Steerage of the first-class ships DOMINION, 584 tons Register, and BANGALORE, 877 tons Register, to sail from London on the 8th and 28th of May, will be granted to persons of the Working Classes, being Gardeners, Shepherds, Farm Servants, Labourers, and Country Mechanics, for which application should be made at the Emigration Office of the Canterbury Association, 9, Adelphi-terrace, Strand, London. By order of the Committee of Management,

H. F ALSTON, Secretary.

EASTER HOLIDAYS.

THE ZOOLOGICAL GARDENS, in the Regent's-park, are open to Visitors every day in EASTER WEEK, except Saturday, on payment of SIXPENCE each person.

INTERESTING FACT.—"The following singular and authentic case of restoration of the human hair is worthy of observation, more particularly as it relates to an article of high and universal repute during the last half century. Mr. A. Herrmann, of Queen-street, Soho, had been quite bald for some time past, and had tried various preparations for the recovery of his hair, but without any beneficial result. He was then induced to try the effects of 'ROWLANDS' MACASSAR OIL,' and after daily applying it for about two months, he, much to his gratification, had his hair quite restored, and now possesses a beautiful head of hair. This fact speaks too strongly for itself to require comment."—*Bell's Weekly Messenger.*

ROWLAND'S MACASSAR OIL.

The unprecedented success of this discovery in restoring, preserving, and beautifying the Human Hair, is too well known and appreciated to need comment. For Children it is especially recommended as forming the basis of a Beautiful Head of Hair, and rendering the use of the fine comb unnecessary.

Price 3*s.* 6*d.*—7*s.*—Family Bottles (equal to 4 small), 10*s.* 6*d.*, and double that size, 21*s.* per bottle. N.B. Each bottle of the genuine article has the words ROWLANDS' MACASSAR OIL engraved in two lines on the Wrapper; and on the back of the Wrapper nearly 1500 times, containing 29,028 letters.

Sold by A. ROWLAND and SONS, 20, Hatton-garden, London; and by Chemists and Perfumers.

SOYER'S UNIVERSAL SYMPOSIUM, GORE HOUSE, Kensington, the residence of the late Countess of Blessington.—This magnificent and unique establishment is rapidly progressing towards completion, and will be opened to the public at the latter end of the month. A description of the interior and exterior, and a comprehensive scale of prices, will shortly be issued. Season tickets for admission to view Soyer's Universal Symposium will be issued in a few days. Single Season Ticket, 1 guinea; Double Ticket, 1½ guinea; Family Ticket, admitting four, 3 guineas. None of which are transferable. The season tickets will be procurable at Mr. MITCHELL'S, Bond-street; Mr. SAM'S, Pall-mall; and at all the principal libraries and music-warehouses.

APPETITE AND DIGESTION IMPROVED.

LEA AND PERRINS' WORCESTERSHIRE SAUCE imparts the most exquisite relish to Steaks, Chops, and all Roast Meat Gravies, Fish, Game, Soup, Curries, and Salad, and by its tonic and invigorating properties, enables the stomach to perfectly digest the food.

The daily use of this aromatic and delicious Sauce is the best safeguard to health.

Sold by the Proprietors, LEA and PERRINS, 6, Vere-street, Oxford-street, London, and 68, Broad-street, Worcester; also by Messrs. Barclay and Sons, Messrs. Crosse and Blackwell, and other Oilmen and Merchants, London; and generally by the principal dealers in sauce.

N.B.—To guard against imitations, see that the names of "LEA and PERRINS" are upon the label and patent cap of the bottle.

# ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

## ANNUAL COUNTRY MEETING OF 1851,

To be Held, by the Gracious Permission of Her Majesty and Prince Albert,

## IN THE HOME PARK, WINDSOR,

IN THE WEEK COMMENCING MONDAY, THE 14TH OF JULY.

**The Society's Show of Live Stock for Breeding Purposes will be open to the Public on the Monday Evening (after the Judges have delivered in their awards), and on the Tuesday, Wednesday, and Thursday of that Week, from Six o'clock in the Morning until Sunset.**

MEMBERS HAVE THE PRIVILEGE OF A FREE ENTRY; AND NON-SUBSCRIBERS ARE ALLOWED TO COMPETE, ON THE PAYMENT OF 10s. ON EACH CERTIFICATE.

*Forms of Certificate to be obtained on application to the Secretary, 12, Hanover-square, London. All Certificates must be returned, filled up, to the Secretary, on or before the* **17th of May,** *the Council having decided, that in no case whatever shall any Certificate be received after that date.—In the application for Certificates, the Character and Age of the Animals to be exhibited should be stated, in order that the proper Forms of Certificate may be sent.*

THE TRAVELLER'S LIBRARY.

On Wednesday, April 30, will be published, in 16mo, price 1s.,

WARREN HASTINGS. By THOMAS BABINGTON MACAULAY. Reprinted from "Critical and Historical Essays contributed to the Edinburgh Review."

Forming the first work of a new Series, entitled

"THE TRAVELLER'S LIBRARY."

*** The "TRAVELLER'S LIBRARY," to be sold at One Shilling each Part, is intended to comprise books of valuable information, in a form adapted for reading while travelling, and at the same time of a character that will render them worthy of preservation. Mr. Macaulay's Memoir of Warren Hastings, taken from his Historical Essays, will commence the publication, and will be followed by his Essay on Lord Clive, and by republications of other works of acknowledged merit, the price of which has hitherto confined them within a comparatively narrow circle of readers. Prospectuses may be had of all Booksellers.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

Now ready, at all the Booksellers, a Specimen Number, Price 2d., of

THE LOOKER ON; A Record of the Literary, Artistic, and Scientific World, suited for Family Reading.

The Specimen Number contains:

The "Looker On" to his Readers.
An Essay: Popular Literature.
The Gownsman of All Souls: a Legend of Oxford. (*To be Continued*).
Pen and Ink Pictures: No. 1.—The Octogenarian.
Reviews: A Trip to Mexico.
Notes and Queries.
Original Poetry: Spring is Coming.
Material for Thought: New Music.
Chit Chat of the Parisian World.
Fine Arts: Music and the Drama.
The Gossiper: Miscellanea.
Literary and Philosophical Institutions, &c.

The aim of the "LOOKER ON" is to combine amusement with information, without throwing aside that high moral tone so necessary in a Family Journal.

The Second Number will be issued on the 3d of May, and will be continued Weekly.

London: A. HALL, VIRTUE, and Co., 25, Paternoster-row; and all Booksellers and Newsvenders.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn-place, in the parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church row, Stoke Newington, both in the County of Middlesex, Printers, at their Office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, APRIL 19, 1851.

HORTICULTURAL SOCIETY OF LONDON.—NOTICE is hereby given that the First EXHIBITION of FLOWERS and FRUIT, in the SOCIETY'S GARDEN, will take place on SATURDAY, May 3d.

Tickets can be procured at this Office upon presenting the order of a Fellow, price 5*s.* each; or, on the day of the meeting, at Turnham green, price 7*s.* 6*d.* each.

PRIVILEGE OF FELLOWS.—Each Fellow of the Society has free personal admission to these Exhibitions without a ticket. He may also personally introduce a friend with an Admission Ticket at half-past Twelve, at Gate No. 4 in the Duke of Devonshire's road; or, if unable to attend personally, his wife or sister may represent him, provided she is herself furnished with an admission ticket to which his signature is attached.

Messieurs les étrangers qui desireront se procurer des billets d'admission pourront en obtenir des mandats en s'addressant à leur Ambassade ou à leur Consulat.

21, Regent-street, London.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.—The Fellows and Members are reminded, that Saturday next, May 3, is the LAST DAY upon which tickets can be obtained at 4*s.* each; or in packets of 30, for 5*l.* 5*s.* per packet.—GENERAL EXHIBITIONS, WEDNESDAYS, May 14, June 11, and July 2; AMERICAN PLANTS, SATURDAYS, May 31 and June 7; ROSE GARDEN, SATURDAY, June 21. Tickets will admit the bearer to either of the above Exhibitions, or upon ANY one DAY in the month of JUNE, except Sunday.

CHELTENHAM HORTICULTURAL AND FLORAL SOCIETY, under the patronage of the Lord Lieut. the Right Hon. Earl FITZHARDINGE, the Right Hon. Lords NORTHWICK, DE SAUMAREZ, and DUNALLY, the High Sheriff WILLIAM DENT, Esq., and other resident Nobility and Gentry.—The days of Exhibition appointed for the year 1851 are THURSDAYS, MAY 8th, JUNE 12th, and SEPTEMBER 11th. The First Exhibition will be held on THURSDAY, MAY 8th, open to all exhibitors, when prizes will be awarded for the following collections of Stove and Greenhouse Plants (12 and 6), Exotic Orchids, Cape Heaths, Azaleas, Pelargoniums, Cinerarias, Anemones, Pansies, Specimen Plants, best New Plants in and out of bloom, and for the best Ornamental Baskets of Plants, Fruit, and Vegetables.—Admission Tickets to non-members (if purchased previous to the day), 2*s.*; on the day of Exhibition, 2*s.* 6*d.* Lists of Prizes, and the Rules of the Society, may be procured from the Hon. Secretary, Mr. J. D. TAGART. The Band of the 1st Regt. of Life Guards is engaged, and will perform throughout the day.

P.S. The following gentlemen have kindly consented to act as censors at the First Exhibition:—Mr. CHARLES TURNER, Royal Nursery, Slough; Mr. JAMES DICKSON, Acre-lane, Brixton; Mr. GEORGE FLEMING, Trentham Gardens, Staffordshire. It is requested that three clear days' notice be given of the space required by intending Exhibitors.

389, High-street, Cheltenham, April 26.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, April 26.

CHEAP DAHLIAS.

HENRY LEGGE begs to inform the Floral Public that he intends sending out, in May next, all the leading Flowers of 1850, at 9*s.* to 12*s.* per dozen; all the good old varieties, from 3*s* to 4*s.* per dozen. Ground Roots cheap of most of the favourites. Catalogues can be had, on application, by inclosing one postage stamp to HENRY LEGGE, Marsh Side, Lower Edmonton, Middlesex.

OUR YORK REGENT PREPARED POTATO CUTTINGS are now ready; all the other sorts named in our former Advertisement can be had on and after the 20th inst. We had our largest crop last year from those we planted on the 20 h of May.—Post-office orders to be made payable to JOHN SANGSTER, Borough Post-office, Newington Butts, London.

HAY, SANGSTER, and Co., April 26.

THE FLOWER OF THE DAY—VARIEGATED SCARLET GERANIUM.—This elegant plant is of vigorous habit, the foliage bright green, with a broad silver margin. The flowers light scarlet, in large trusses, like Globe Compactum. JOHN and CHARLES LEE are selling extra strong plants, at 10*s.* 6*d* each. Small plants for bedding on the 1st of June, 6*s.* per dozen.—Nursery and Seed Establishment, Hammersmith, near London.

GRASS SEEDS.

FINEST LAWN GRASS SEEDS, perfectly free from Weeds and coarse Grasses, 21*s.* per bushel, 3*s* per gallon, or 1*s.* 3*d* per lb., with instructions.

*To ensure a pure turf of finest Dwarf Grasses*, Messrs. SUTTON strongly recommend the sowing the above Seeds, whereby the great expence of cutting, carting, and laying Turves may be avoided.

*Quantity of Seed required to form new Lawns* 40 lbs. per acre (*i. e.* 1 lb. to every 4 poles); or 10 lbs. per acre sown immediately *upon old Lawns* will greatly improve them.

All orders above 10*s.* are sent carriage free to London, Bristol, Southampton, &c.—Address JOHN SUTTON and SONS, Reading, Berks.

THE following PELARGONIUMS, well-grown blooming plants, are offered at 1*s.* 6*d.*

| | |
|---|---|
| Beck's Symmetry. | Beck's Princess. |
| ,, Gigantic. | ,, Gulielma. |
| ,, Hebe's Lip. | ,, Marc Antony. |
| ,, Emily. | ,, Cassandra. |
| ,, Mustee. | Hoyle's Mount Etna. |
| ,, Zenobia. | ,, Orion. |
| ,, Rosy Circle. | Story's Mont Blanc No. 2. |

The following at 9*d.*

| | |
|---|---|
| White Perfection. | Marchioness of Waterford. |
| Beauty of Clapham. | Regulator. |
| Nestor. | Dido. |
| Beauty of Walthamstow. | Duke of Cornwall. |
| Sarah June. | Margaret. |
| Duchess of Leinster. | Unique. |

THOMAS RIVERS, Sawbridgeworth, Herts.

FORGET-ME-NOT.

MYOSOTIS AZUREA GRANDIFLORA.—This unique variety stands unrivalled for its colour and habit, being very superior to the older sorts of that lovely flower, the Forget-me-not; it also possesses the following good qualities over them: The flowers are much larger, perfectly hardy, and will stand for many years in the same situation; it is a lively blue, and grows about 9 inches high, producing hundreds of blooms on the plant at a time; flowering from June till October, it will be found very useful for planting on rockwork, making a bed or forming edgings; being a colour much wished for, as there is a great deficiency of dwarf blue flowers for autumn blooming. The Seed of the above is now ready to be sent out, at 2*s.* 6*d* per packet. Also the following varieties of Flower Seeds can still be had; Hollyhock Seed, 2*s.* 6*d.* per packet of 150 seeds; German Aster Seed, 1*s.* per packet; Sweet-William Seed, 1*s* per packet; Antirrhinum Seed, 1*s* per packet; and also the other varieties of Seeds named in the former Advertisement in this Paper on the 5th of April. The whole or any part of the above sent postage and package free. A remittance must accompany the order, either in cash or penny postage stamps, for the amount.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath.

NEW DAHLIAS.

CHARLES TURNER will be prepared to execute orders on the 1st of May for the following varieties, which are very superior flowers, and should be in every collection grown for exhibition:—

NEPAULESE PRINCE (STEIN) crimson, shaded with dark maroon, very superior constant show flower, being an improvement on Richard Cobden; has obtained numerous first prizes in class showing and six first-class certificates ... ... ... ... ... 10 6

NIL DESPERANDUM (STEIN) vivid scarlet, unquestionably the best of its class, the petal good, flower of great depth, and finely developed, one of the leading flowers of the season; has been very successful ... ... ... 10 6

BARMAID (HOLMES) white, occasionally tinged, but generally a fine white of unusual substance ... ... 10 6

ROUNDHEAD (HOLMES) salmon buff, deep, full, finely formed flower, good grower, at all times to be depended on; habit particularly good; took certificates at Metropolitan, Royal South London, and Norwich ... ... 10 6

NAPOLEON (PARKER) rich vermilion, of a novel and striking shade, flower deep and symmetrical, constant and good habit; certificate at Wycombe ... ... 10 6

REGINA (HALE) shaded rose, smooth good petal, well formed, good size; took certificate at Royal South London ... ... ... ... ... ... ...10 6

SIR CHARLES NAPIER (HALE) rich scarlet, fine firm flower, finely formed and closely set, handsome close centre; took certificate at Highgate ... ... ... 10 6

JULIEN (HALE) rosy purple, nearly cupped, of great depth; took certificates at Slough and Notting Hill ... 10 6

FANCY DAHLIA.

MRS. HANSARD (UNION) raised by J. Edwards, Esq.; yellow, with distinct white tips, fine form, and full size; very true and constant in every respect; a noble addition to this class; has been eminently successful at 12 of the principal shows ... ... ... ... ... 10 6

CHOICE NEW FUCHSIAS,

WHICH WILL BE READY WITH THE DAHLIAS.

EXPANSION (BANKS) pure white tube and sepals, bright rose corolla, very stout and abundant bloomer, one of the best light varieties ... ... ... ... ... 7 6

VOLTIGEUR (BANKS) crimson tube and sepals, dark purple corolla, the sepals reflex well, and show the rich corolla to great advantage ... ... ... ... 7 6

CONSPICUA (BANKS) white tube and sepals, vermilion corolla, very large and attractive ... ... ... ... 7 6

PRINCESS (BANKS) white, red corolla, very free bloomer, and good habit ... ... ... ... ... ... ... 5 0

DUCHESS OF KENT (KNIGHT) blush tube, sepals tipped with green, vermilion corolla, exceedingly long handsome flower ... ... ... ... ... ... ... 7 6

ELECT (BANKS) crimson tube, rosy purple corolla, of fine habit ... ... ... ... ... ... ... 5 0

MADAME SONTAG (BANKS) white tube, bright vermilion corolla ... ... ... ... ... ... ... 5 0

AJAX (HOCKEN) large dark, fine habit ... ... ... 5 0

BRILLIANT (BANKS) crimson, purple corolla, good habit, and very free bloomer ... ... ... ... 5 0

LOVELINESS (BANKS) small pleasing light ... ... ... 3 6

General Catalogue can be had on application.

Royal Nursery, Slough, near Windsor.

VALUABLE VEGETABLES.—CAULIFLOWERS.—Myatt's improved early, much earlier than the old varieties, more compact and heavier, considered by the raiser as most desirable, quantity very limited; 1*s.* packets.

BRUSSELS SPROUTS, improved variety, direct from Brussels; 1*s.* per oz., 6*d.* per packet.

CABBAGE, MITCHELL'S ENFIELD.—This has been tried at the Horticultural Society's Garden, and pronounced one of the best; 1*s.* per oz., 6*d.* per packet.

CABBAGE, CHAPPEL'S COLEWORT, excellent for Winter Greens, 6*d.* per oz.

CARROT, ST. JAMES', one of the best for small gardens, and shallow or heavy soils; 3*d.* per oz.

CELERY, COLES' SUPERB RED, very extensively grown last season, and pronounced first-rate; 1*s.* per oz., 6*d.* per packet.

LETTUCE, VICTORIA CABBAGE, but little known, but one of the handsomest grown, and which no gentleman's garden should be without.

DUNCAN HAIRS, in offering the above selection from his general List, begs to inform his friends that he warrants them to be as described.

109, St. Martin's-lane, Charing Cross, London.

SEEDLING PETUNIAS.

ISAAC DAVIES begs to announce that he will be prepared to execute orders for the following SEEDLING PETUNIAS early in May:—

1. ALBA PURPUREA, white, with a broad edging of deep purple.
4. EXQUISITE, white, with purple edge, very round and pretty.
5. POURPRE ROYALE, crimson purple, very stout, and good form, at 3*s.* 6*d.* each. Discount to the trade when more than one of each are taken.

Flowers of the above were sent to Mr. E. G. Henderson, St. John's Wood, London, on the 18th of September last, and his opinion was as follows:—

"The Petunia flowers reached me in good order. No. 5 is, in my opinion, the best; it certainly is a fine rich-looking flower, of good shape, and distinct from any out. Nos. 1 and 4 I also admire for their markings on the edge, but as they were not fully expanded, have my doubts whether they would retain the marking as distinct when in full bloom."

I. D. begs to state that Nos. 1 and 4 retain their beautiful purple edge almost as distinct until the flowers fade. I. D. has also a fine stock of Seedling Calceolarias in great variety; large plants, in bloom, at 8*s.* per dozen. Story's Fuchsias, Ignea, Multiplex, South Devon, Striata, Mirabilis, and Unique, at 1*s.* 6*d.* each.—Larkfield Nursery, Wavertree, near Liverpool.

NEW PLANTS.

AMBROISE VERSCHAFFELT, NURSERYMAN, Ghent, Belgium, begs to offer to Amateurs and to the trade the following NEW PLANTS:—

HUGH LOW AND CO.'s NEW CATALOGUE OF PLANTS is just published, and will be sent free on prepaid application.—Clapton Nursery, London.

CHOICE BEDDING PLANTS.

HENRY WALTON, FLORIST, &c., Edge-end, Marsden, near Burnley, Lancashire, begs to offer the following at the extremely low prices attached, viz., 100 fine named Dahlias, including several of 1850, for 50*s.*; 50 for 30*s.*; 25 for 9*s* to 18*s.*; 12 for 4*s.* 6*d.* to 9*s.*; Pansies, 25 fine named varieties, 10*s.*; 12 do., 4*s.* 6*d* to 6*s.*; 12 fine named Pinks, 4*s.*; 12 Verbenas, 3*s* 6*d.*; 12 fine named scarlet Geraniums, 4*s.* 6*d.* to 6*s.*; 12 Ivy-leaved do., 4*s.*; 12 common Geraniums, fine strong plants, 4*s* 6*d* to 6*s.*; 12 Cupheas, 3*s.* 6*d.*; 12 Heliotropiums, of sorts, 4*s.*; 12 fine named Petunias, 4*s.*; 12 Mimulus, 4*s.*; 12 Lobelia erinus, of sorts, 6*s.*; or 12 of each of the above lots for 2*l.* The above may be had the second week in May, in strong healthy plants, securely packed, so as to ensure safe delivery of all orders.

Achimenes Tugwelliana, longiflora alba, fimbriata, Ghiesbreghtii, Bodmeri, Escherii, rosea superb, eximia rosea, cordata, Knightii, Skinneri grandiflora, patens major. The above 12, free by post, for 10*s.*; or 6 for 7*s.* 6*d.* Gloxinias, 12 fine named varieties for 9*s.* to 16*s.*; or 6 for 5*s.* to 10*s.*

Catalogues may be had by inclosing one stamp. Strong well-rooted plants may be depended upon. It is respectfully requested all orders be accompanied with a Post-office order, made payable at Marsden, near Burnley, Lancashire.

FIFTY-FOLD KIDNEY POTATO.

JAMES LAKE, NURSERYMAN, &c., Bridgewater, Somerset, begs to inform the public that he is now sending out his Seedling Fifty-fold Kidney Potato, six tubers of which were sent to Dr. Lindley, April 29th, 1850, and produced 312, quality very good; six tubers also sent to Beck, Henderson, and Co., at the same time, produced 580, although grown in poor ground. Price 4*s.* per peck.—London Agents: HURST and M'MULLEN, 6, Leadenhall-street.

J. L. having grown from 15 to 20 lights of Aban's Conqueror of the West CUCUMBER, successfully for three years, can with confidence recommend it to the public as being one of the best kinds in cultivation. Packets containing 12 seeds, 1*s.* each.

NEW DAHLIAS; E. FOSTER'S, Esq., CHOICE PELARGONIUMS; PICOTEES, CARNATIONS, HOLLYHOCKS, PANSIES, &c.

WILLIAM BRAGG, Star Nursery, Slough, begs to say his Catalogue of the above Flowers is now ready, and can be had on application. His choice SEEDLING DAHLIAS will be sent out the first week in May at 10*s.* 6*d.* each, viz:—

ADMIRAL, rich lilac, very constant, gained first Seedling prize, 25*s.*, at the Royal South London Exhibition; 21*s.* Shacklewell Open Showe, &c., fourteen first class certificates; the most successful flower of the year.

CARMINA, rich carmine, constant show flower, gained six first class certificates, &c., shown in several winning stands.

The Hon. MRS. ASHLEY, waxy white, tipped with rose, splendid show flower, &c. W. B. thinks it the best Dahlia of the season; was awarded by Dr. LINDLEY a certificate of merit at the Horticultural Society, &c. Gained five first class certificates.

QUEEN OF FAIRIES, Domeyer. W. BRAGG has purchased the stock of this fine and constant fancy Dahlia, from the above amateur, who will give 5*l.* in prizes the next season for this flower. It gained a Seedling prize and first class certificate, with Edwards's Mrs. HANSARD; at the Royal South London Open Show Exhibition five first class certificates.

W. B.'s stock of Picotees, Carnations, and Pinks are strong and good; the best Hollyhock Seed ever sent out can be had in 2*s.* 6*d* and 5*s.* packets, post paid, for prepayment.

AZALEA INDICA "SYMMETRY" (KINGHORN.)—The celebrity this Flower has gained, and the eulogium that has been bestowed upon it, render it only necessary to mention the opinions of competent judges, the awards it has received, and simply to add that it is superior in shape and substance to any variety hitherto introduced, and equal in colour and habit to the most popular kinds. In May, 1850, a first class certificate was awarded to it by the London Floricultural Society, and it was thus described in the *Gardeners' and Farmers' Journal*. "Azalea indica Symmetry is a magnificently formed flower, of extraordinary substance; colour salmonish-pink, varying to light scarlet, richly spotted in the throat with deep crimson; size large." At the June show, 1850, at Chiswick, it obtained the Silver Banksian Medal, and was recorded in the *Gardeners' Chronicle* as "a considerable improvement on Lateritia." JOHN and CHARLES LEE, having purchased the stock of Symmetry, intend sending out healthy Plants on the 1st of June, price 21*s.* each.—Nursery and Seed Establishment, Hammersmith, near London.—April 26.

J. COLE begs to announce that he has a fine healthy Stock of PANSIES to part with, at 6*s.* per dozen. They are all beautiful show varieties, and J. C. has no doubt that they would give every satisfaction, should any lady or gentleman favour him with their orders.

Rugby, Warwickshire, April 26.

EXTENSIVE SALE OF PINE-APPLE PLANTS.

TO NOBLEMEN AND GENTLEMEN requiring PINE PLANTS, an excellent opportunity is offered for supplying themselves with clean healthy plants. The stock consists of several hundred fruiting and succession plants, of the following sorts:—Providence, Black Jamaica, Black Antigua, Montserrat, Enville, Globe, Queens, Ripley Queen, Antigua Queen, Moscow Queen, St. Vincent, Blood, smooth and prickly Cayenne, Trinidad.—For particulars apply to J. and C. LEE, Nursery, Hammersmith; to Mr. MARNOCK, Royal Botanic Gardens, Regent's Park; or to Mr. MOFFATT, Chamber Gardens, Worksop, Notts.

WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WM. WOOD AND SON beg to offer choice collections of the following plants:—

| | Per dozen—*s.* | *d.* | *s.* | *d.* |
|---|---|---|---|---|
| Azalea indica, fine collection, strong bushy plants | 9 | 0 | to 18 | 0 |
| Ericas, fine and bushy | 9 | 0 | „ 18 | 0 |
| Epacrises | 12 | 0 | „ 18 | 0 |
| Corræas | | | 9 | 0 |
| Geraniums, fine show varieties, strong bushy plants | 6 | 0 | „ 18 | 0 |
| Do., scarlet and rose colour | 6 | 0 | „ 12 | 0 |
| Chrysanthemums, best French varieties | 6 | 0 | „ 12 | 0 |
| Do., miniature do. do. | 9 | 0 | „ 12 | 0 |
| Phloxes, all the best new kinds | 6 | 0 | „ 12 | 0 |
| Petunias | 6 | 0 | „ 12 | 0 |
| Verbenas, very strong | 4 | 0 | „ 12 | 0 |
| Antirrhinums | | | 6 | 0 |
| Fuchsias | 6 | 0 | „ 12 | 0 |
| Hollyhocks, fine sorts, unnamed | | | 6 | 0 |
| Anemone japonica | | | 6 | 0 |
| Escallonia macrantha | each | | 3 | 6 |
| Lycopodium cæsium arboreum | „ | | 3 | 6 |

Extra plants presented to compensate for carriage.

Rose Nippers from 2*s.* 6*d* to 4*s.* per pair; Metallic Labels for pot Roses 2*s.* per 100; Scotch prepared Tobacco Paper, highly recommended as the best sort for all horticultural purposes, 2*s.* per lb.

NEW DWARF DAHLIAS, to be sent out the first week in May.

GAINES'S PRINCE ARTHUR, beautiful carmine; height, 18 inches. 10*s.* 6*d.* The above is the greatest novelty of the season; good for bedding or showing.

GAINES'S RACHAEL, crimson purple, tipped with white; 3 feet. 10*s* 6*d.* This is one of the best fancy Dahlias ever offered to the public.

Descriptive Catalogues may be had by applying at the Nursery, Surrey-lane, Battersea, near London.

TULIPS.

MR. DAVIDSON, Camden Grove, Peckham, will submit a portion of his BULBS for Sale, during the bloom, by private contract.—Applications for Catalogues (with a price to each row) will please address, free, inclosing a postage stamp.

WARRANTED UNEQUALLED.

ROBERT WHIBLEY is now supplying Selections in Pots, and by Post, from his select Collection of FUCHSIAS. Twelve Varieties, new and distinct, of last year, 10*s.* 6*d.* cash. See List containing a great variety of choice new plants for one stamp.—Nursery, Kennington, London.

BATH NURSERY.

JAMES GRIFFIN begs to announce that his Annual Spring CATALOGUE is now ready, and may be had on application. It contains a Descriptive List of all the newest and best Dahlias, Fuchsias, Verbenas, Phloxes, &c.; also a Select List of the most useful plants adapted for decorating the Flower Garden. The prices will be found exceedingly low. Weston-road, Bath.

TO AMATEUR DAHLIA GROWERS, AND OTHERS.

DAHLIAS.—New light tipped Dahlia "Sylph," raised by Mr. Servey, Chingford, Essex, and certified first-class, at the Royal South London Floricultural Society's Show, Surrey Gardens. "Sylph" is of fine free habit, blooms well out of the foliage, smooth cupped petal, circular outline, and very high centre; indispensable to exhibitors.

JOSEPH COURCHA having purchased the above, will be prepared to send out strong plants the first week in May. Price 10*s.* 6*d.* per plant. The usual allowance to the trade. J. C.'s Annual Catalogue may be had, on application, to JOSEPH COURCHA, Florist, Wellington-row, Hart's-lane, Bethnal Green-road, London.

SCARCE AND BEAUTIFUL SEEDS.—SWEET WILLIAM SEED, in 100 varieties, 1*s.* per large paper.

SNAKE CUCUMBER, grows 6 to 8 feet long, 1*s.* per paper.

CINERARIA, from the most superb varieties, 1*s.* per paper.

EMPEROR STOCK, flowers from July to November, and the same plants year after year, 1*s.* per paper.

CHINA ASTER.—Flowers of this sort have taken first prizes wherever exhibited, 6*d.* per paper.

CALCEOLARIA, from a most superb collection, 1*s.* per paper.

CALENDRINIA UMBELLATA, a brilliant and beautiful hardy perennial, 1*s.* per paper.

The above may be had of Messrs. JEYES and Co., Nurserymen, Northampton.

Payment can be made with postage stamps.

NEW HELIOTROPE "GEM."

JOHN SALTER, F.H.S., will send out this beautiful variety on the 1st of May, at 5*s.* per plant. It was pronounced by all who saw it in bloom last season to be the most distinct yet raised. The colour is blue purple, with large white centre; it is a free bloomer, compact trusser, very odorous, dwarf habit, and well adapted for bedding; was awarded a First-class Certificate at the grand Metropolitan Show in September, and is figured in the "Magazine of Botany." Coloured prints may be had by sending four postage stamps. His new Dahlias Gracilis, Uranus, Mr. Chouveau, Phaeton, Pompey, and Princess Charlotte, with many other fine new varieties (see Catalogue); together with new Phlox, Chrysanthemums, &c., will be ready in May.

The stock of Pentstemon Salterii not being sufficient to complete orders, cannot be sent out until the summer; it will then be exhibited. This variety is quite distinct from any other, and must be seen to be appreciated. The tube and sepals are white, edged with bright pink; the throat finely pencilled carmine. 7*s.* 6*d.* per plant.

Versailles Nursery, near Hammersmith-turnpike, London.

NEW PLANTS.

BASS AND BROWN have to offer the following, in well-established plants. Prices to the Trade on application.

| | Each.—*s.* | *d.* | | Each.—*s.* | *d.* |
|---|---|---|---|---|---|
| Anguria Warsewiczii | 7 | 6 | Gloxinia M. Van Houtte | 3 | 6 |

ACHIMENES Escheriana, Bodneri, Baumanni, Longiflora alba or Jauregia, Rosea superba and Tugwelliana, 2*s.* 6*d.* each, or the set for 12*s.*

Descriptive Catalogues forwarded on application.

Seed and Horticultural Establishment, Sudbury, Suffolk.

SEEDLING CINERARIAS AND ANTIRRHINUMS.

WM. IVERY begs to offer to his friends and the public the superb Seedling Cineraria HAMMERSMITH BEAUTY, blue, with a white centre, the most showy and distinct ever offered; good plants 7*s.* 6*d.* each. W. I. can supply a few good strong plants of the approved seedling variety sent out last autumn.

CINERARIA "ELECTRA" (IVERY).—Violet purple, petals broad, habit beautiful, colour new, bright yellow disc, and flowers abundant; 7*s.* 6*d.*

CINERARIA "MADAME MIELLEZ" (IVERY).—Pure white ground, black eye, blue edge, petals broad, bloom abundant, habit good; 7*s* 6*d.*

CINERARIA "FEARLESS" (IVERY).—Light blue, fiery, centre, and white disc; form good; 5*s.*

CINERARIA "LITTLE WONDER" (IVERY'S).—White, tipped with rosy crimson, fine habit, and attractive variety; 5*s.* Good named varieties—12*s.*, 20*s* to 30*s.* per dozen.

ANTIRRHINUM "ALBA LUTEA."—White ground and yellow front, distinct; 5*s* each.

ANTIRRHINUM "DELICATISSIMA" (IVERY'S).—Mixed light and pink, beautiful veined. Shape very fine, and bold in front; 5*s.*

W. I.'s Spring Select Catalogue of Geraniums, Fuchsias, Verbenas, Cinerarias, Petunias, Antirrhinums, Phloxes, Chrysanthemums, Choice and select Plants, and Hardy Herbaceous Plants, can be had on application.

Hanover Nursery, Peckham, near London.

"ROYAL CHANCELLOR" GERANIUM.

W. TURNER, FLORIST, &c., begs to announce that he is prepared to send out his new beautiful Scarlet Geranium, the ROYAL CHANCELLOR, an exceedingly free grower and bloomer, of dwarf habit, &c. It has been pronounced by competent judges to be the brightest scarlet of first-rate form yet out. Plants 5*s.* each, packages included. Discount to the trade when three are taken. A remittance must accompany all orders.

Richmond Garden, Madingly-road, Cambridge.

JOHN SEALEY, FLORIST, &c., Mugland Nursery, St. George's, Bristol, will be prepared with extra strong plants (ready to send out the 1st of May, 1851) of his superb WHITE DAHLIA, the QUEEN OF THE WEST, and a general Catalogue of the leading varieties of the day may be had on application.—April 26.

THE following useful description of NURSERY STOCK may be procured from the extensive Nursery ground of W. ROGERS, SEN., NURSERYMAN and CONTRACTING PLANTER, Red Lodge, near Southampton, delivered free at any of the Stations on the South-Western Railway, this being now the best season for transplanting them:—

Rhododendron ponticum, 2 to 4 inches, 40*s.* per 1000; 4 to 6 inches, 80*s.* per 1000; 12 to 15 inches, fit for working or for planting our for cover, 10*s.* per 100; 2 to 2½ feet, 20*s.* to 40*s.* per 100; Standard, 5 to 6 feet, fit for working, the scarlet, or fine new varieties, 40*s.* per 100, or 6*s.* per dozen; Roseum, 3 feet, 9*s.* per dozen; Hybrida, in many fine mixed varieties, 1 foot, 50*s* per 100; white Arboreum, 18*s.* per dozen; white Ponticum, 12*s.* per dozen.

Kalmia latifolia, fine plants, 2 feet, 12*s.* per dozen, 75*s.* per 100.

Azalea pontica, 1 foot, 25*s.* per 100.

Arbutus, 1 foot, 12*s.* 6*d.* per 100.

Laurestine, 1 foot, 3 sorts, 12*s.* 6*d.* per 100.

Double Camellias, 1 foot, 12*s.* per dozen, in 8 or 10 fine varieties.

Single Ditto, strong, and fit for working, 6*s.* per dozen, 40*s.* per 100, small, 25*s* per 100.

Abies Douglasii, from seed, handsome plants, 1½ to 2 feet, in pots, or from open ground, 30*s.* per dozen.

Scotch Fir, 2 years' seedling, fine, 2*s.* per 1000.

Stone Pine, 1 foot, 12*s.* 6*d.* per 100.

Caultheria procumbens, strong plants, 25*s.* per 100.

Mahonia aquifolia, for cover, 8*s.* per 100.

Furze, for cover, 10*s* per 1000.

TRUE YELLOW GLOBE MANGOLD WURZEL SEED, FROM SELECTED BULBS, in quantities of 10 lbs. and upwards, at 6*d.* per lb.; WHITE BELGIAN CARROT, 9*d.* per lb.; FRESH IMPORTED LUCERNE, 9*d.* per lb.; ASHCROFT SWEDE, 9*d.* per lb.; SKIRVING'S LIVERPOOL SWEDE, 8*d.* per lb.; DICKINSON'S IMPROVED ITALIAN RYE-GRASS, 7*s.* 6*d.* per bushel.

Carriage free to London, Bristol, Southampton, &c.

Address—JOHN SUTTON and SONS, Seed Growers, Reading, Berks.

RIVERS'S STUBBLE SWEDE TURNIP SEED.

J. RIVERS solicits the attention of Agriculturists to his quick-growing SWEDE TURNIP. The variety owes its origin to a cross between a large variety of the Early Stone, in 1842, and the old Green Top Swede. It has become a distinct variety, by carefully selecting, for seven years, those most like the Swede in habit, so that now it is a true Swede, with the earliness of the White Stone; it is green-topped, with a short neck, with the solid yellow flesh of the common Swede; for sowing in May, for early feed, or for late sowing upon heavy land and sheep-fed leys, it will be found a valuable Turnip for hardiness and keeping qualities; also for sowing near large towns, to draw off early. It grew 11 tons per acre after Tares, mowed, without manure, on the 6th of August, 1849. Specimens of the roots were exhibited at the Baker-street Cattle Show; also specimen roots of different times of sowing, from May till August, were exhibited. Orders for any quantity above 10 lbs. will promptly be attended to, if addressed to JOHN RIVERS, Seedsman, Sawbridgeworth, Herts, at 2*s.* per lb., carriage paid to London. It will be sold in sealed bags, of 2½ lbs., price 5*s.*; and 5 lbs., 10*s.*, by his agents, a list of whom will be found in the *Gardeners' Chronicle* of 22d March. Messrs. Sutton and Sons, Seedsmen, of Reading, who proved this Turnip with others in their sample ground last summer, state as follows:—"Seed sown on June 30th, July 20th, and August 10th, using the same manure for all, gave the following results—from the first sowing, the roots were fully equal to the *best* of the other sorts; from the second and third sowing, they were far superior in size, weight, and shape, thus showing its peculiar adaptation for late sowing."

DEANE'S WARRANTED GARDEN TOOLS.—Horticulturists, and all interested in Gardening pursuits, are invited to examine G. and J. DEANE'S extensive Stock of GARDENING AND PRUNING IMPLEMENTS, best London made Garden Engines and Syringes, Coalbrookdale Garden Seats and Chairs.

G. and J. DEANE are sole Agents for LINGHAM'S PERMANENT LABELS, samples of which, with the Illustrated List of Horticultural Tools, can be sent, post paid, to any part of the United Kingdom.—DEANE'S Horticultural Tool Warehouse, opening to the Monument, 46, King William-street, London-bridge.

CHINA PIGS FOR SALE.—A Boar and two Sows, six months old. Price, 10*l.*—Apply to Messrs. JESSOP, BROTHERS, The Aviaries, Cheltenham, Gloucestershire.

INDUSTRY AND HUMANITY *versus* MURDER AND PLUNDER.—Thousands of valuable lives saved by using Marriott's new BEE-HIVE for the humane management of Honey Bees; its real practical utility is at once apparent. Nutt's Collateral, Taylor's Bar and new Box and other Hives for obtaining the fruit of industry without destroying the bees; a descriptive engraving with priced catalogue of apiarian utensils forwarded on receipt of two penny stamps.—MARRIOTT, Bee-hive and Honey Warehouse, 74, Gracechurch-street, London.

SUTTON'S GRASS SEEDS.

PERMANENT PASTURE GRASSES,

*Mixed expressly to suit the soil for which they are required, at the reduced price of 22s. 6d. to 28s. per acre.*

SUTTON'S RENOVATING MIXTURE, consisting of Perennial Clovers and fine Grasses, for improving old Parks, Meadows, and Upland Pastures.

JOHN SUTTON and SONS *having reduced the price of these Seeds 25 per cent., viz., to 10d. per lb., or 1s. 6d. per gallon, great improvement in Pastures, &c., may be effected at a small cost, by the application of 6 or 8 lbs. per acre, sown immediately upon the old Turf.*

We are almost daily receiving unsolicited the most gratifying letters from our customers, in praise of our Seeds; and though we refrain from *publishing names* unnecessarily, we have much satisfaction in quoting the following:—

*From a Member of the Council of the Royal Agricultural Society.*

"Messrs. SUTTON,—I was particularly pleased with your Grass Seed, which I employed by itself, for laying down some fresh broken-up Land. It became a close fine sward by August. I have now about 30 acres of land to sow immediately, &c., &c., and shall be glad of your advice for the purpose."

*From a Clergyman, an eminent Agriculturist, and Member of the Royal Agricultural Society.*

"I have had the pleasure of praising your Seeds in many quarters beside that to which you refer. This I have done from a sense of justice only."

*Another Clergyman writes us—*

"My Turnip crops are the admiration of all the farmers round, especially the Swedes and your Purple-topped Hybrid. I hope you have some of the same kind this year, as I am certain the superiority in my crops is mainly owing to the stocks."

*The above are similar to hundreds of others.*

N.B.—Instructions for sowing accompany every parcel of Grass Seeds; and any other information required by post will be promptly given.

*Goods delivered free of carriage to any Office in London, Bristol, Gloucester, Exeter, Southampton, &c.*

Reading, Berks, April 26.

E. G. HENDERSON is now prepared to send out the following New Plants:—

These marked thus * can be sent by post if desired, without extra charge. Goods sent carriage free to London; and for long carriage of goods of 40s. and upwards extra plants sent gratis. Particular attention is paid to secure packing, and strong packages provided for plants sent to long distances.—Post-office orders are payable either to BASS and BROWN, or to STEPHEN BROWN. Remittances requested from unknown correspondents.

Seed and Horticultural Establishment, Sudbury, Suffolk.

SKIRVING'S IMPROVED TURNIP SEEDS.

WM. SKIRVING begs to announce to his friends and the public that he has fixed the price of his IMPROVED SWEDE, and also the PURPLE-TOP YELLOW-BULLOCK, at 9d. per lb.

In consequence of W. S. having extended the growth, and having had a very abundant crop of the Seed of his Improved Turnips, he is this season enabled to offer it at the above reduced price, and he is also induced to take this step to prevent Agriculturists being imposed upon by the sale of spurious Seeds, offered at a low rate, under his name.

W. S. can, with perfect confidence, recommend these Turnips as being the best now in cultivation, in every respect, whether for the greatest crop, the best quality, or for keeping, according to the time of sowing.

All other Agricultural Seeds, of the best quality, at very moderate prices. A remittance or reference is requested from unknown Correspondents.

N.B. W. SKIRVING has no Agent in town or country.

Queen-square, Liverpool, April, 1851.

QUEEN OF DAHLIAS, white, distinctly edged with rosy purple, large, fine form, and constant, has taken first prizes in its class where shown (was named by Mr. GLENNY, and he pronounced it the very best of all our cupped edged Dahlias), will be let out in May, 1851, as far as stock will go, at 10s. 6d. per plant.

KING OF DAHLIAS (MORGAN'S), and others at catalogue price.—Address to W. KELSALL, Wilmslow, near Manchester.

The Gardeners' Chronicle.

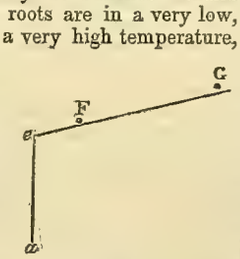
COUNTRY SHOWS.—Wednesday, April 30: Newcastle-on-Tyne Botanical and Horticultural, and Handsworth and Lozells Horticultural.

A CORRESPONDENT expresses his surprise at a very common occurrence. "I have sent," he says, "a small piece of a Morello Cherry, with fruit as large as a bird's egg. This was produced on a branch 11 feet from the stem. The flowers opened in February. Nine inches, near the extremity of the branch where the fruit grew, were nailed across a chimney, where there is always a little warmth. Now, it has often been stated that there must be a circulation between root and branch before the latter can produce fruit. When this was in bloom, and setting the fruit, the tree appeared to be quite dormant in every part, except the 9 inches in question. The situation faces North, and is quite exposed."



The occurrence of a local leafing, when a part of a plant is exposed to a high temperature, while all the rest of it is in a low temperature, is familiar to gardeners. If you leave the branch of a Vine out of doors, while the other branches are warmed in a forcing house, the latter will be in leaf and flower before the former moves; or, if there is a warm passage through which the branch of a Vine is made to pass in the winter, the roots and branches being otherwise unprotected, the branch in the warm passage will be in leaf and flower long before the other parts move.

The reason is, that in trees each bud grows by itself, and for itself, possessing an independent vitality, and feeding upon what the branch contains as long as there is anything in the branch capable of being consumed, that is to say, as long as the internal circulation of the remainder of the tree can replace what disappears where the parts are growing. Thus let the following diagram represent a horizontal branch, the letters standing for buds; if F G are heated and stimulated into growth

by any local action, they will feed upon the matter included in the branch *e h*, and as that matter disappears, its place will be gradually taken by similar matter supplied by *a e* and *h k*. When that supply ceases F G perishes, but not till then. In our correspondent's case F G was warmed by the chimney.

One of the commonest of all accidents in forcing belongs to this class of facts. A gardener forces his Vines early, they grow vigorously and promise an abundant crop: suddenly the bunches "shank off." In such a case the roots are in a very low, while the branches are in a very high temperature, and the action is of this nature. F G grows fast in the damp warm air of the forcing house; and as long as the branch F G contains the food which the young leaves and fruit require all goes well; but at last F G is exhausted, and *a e*, surrounded with cold wet earth, torpid and powerless, is unable to replace, or replaces very imperfectly, what F G has lost. The supply of food is thus cut off, and F G is literally starved; but if *a e* is warmed, it pours upwards the food it contains, continually sucks more from the earth, and thus maintains F G in health and vigour.

If all gardeners would, as many do, always look for these analogies, and trace them to their first cause, they would find themselves wonderfully relieved from the embarrassments into which they are thrown by the sudden occurrence of an event which they might have fore-known must occur.

THERE are some important subjects which appear to be brought before the attention of Government, from time to time, and about which a great deal is said, though nothing is done; one of these, certainly, is the SUPPLY OF WATER to London. During the last 30 years, a number of Parliamentary commissions have sat, and inquired into the alleged impurity of the water with which we are supplied; they have listened patiently to a great amount of so-called "evidence," have made reports, and published voluminous blue books; all of which, as far as the public are concerned, have, in fact, led to nothing. The evils, inconveniences, and defects, of the existing state of things, stand unaltered, just as they did before the appointment of the first commission; the only difference being, that as London has considerably increased during the last 30 years, so the evil has become one of greater magnitude. The last report on the subject was published only a few months since, and though it no longer appears in the dreary and formidable shape of an old-fashioned Parliamentary blue book, yet it is, nevertheless, a sufficiently heavy affair, consisting of five octavo volumes; the first containing the report itself, and the remaining volumes constituting appendixes, including a most miscellaneous mass of evidence, facts, conjectures, suggestions, and absurdities, to wade through which is, in truth, a very serious and unprofitable labour. It is melancholy to see how much trouble is often taken to prove what no one for a moment doubts; and, on the other hand, how much ingenuity is expended in trying to establish self-evident falsehoods! Getting up evidence for a Parliamentary committee is, in fact, a peculiar art, and the general tendency of the evidence depends mainly on the cleverness of the persons who get it up. Every one knows that a shrewd lawyer will often extract from a witness evidence which seems to prove the very opposite of what he knows to be true, and in the same way the evidence brought out before a committee, depends on the knowledge or bias of those who may chance to be on it; sometimes the evidence to be received is all ready "cut and dry," before any questions are asked; and often the committee are wholly incompetent to decide whether the witness speaks sober truth, or talks absolute nonsense! The report on water, of which we are now speaking, though it is not a parliamentary one, but is, in fact, one emanating from the General Board of Health; nevertheless, in many respects, partakes of the nature and defects of the old blue book.

The question of supplying London with water is theoretically simple enough, but it is practically one of the most difficult problems any one can investigate. Practically, the question resolves itself into two great heads, namely, is the present supply satisfactory either as regards quantity or quality? and, secondly, how can it be extended and improved? In carrying out any such extension, however, we are met on all sides by difficulties; rival water companies are up in arms, vested rights are endangered, corporations are indignant, every one is displeased, and of course the result is, nothing is done. As far as the more scientific part of the subject is concerned, there are several fundamental points which no one questions, excepting, perhaps, those whose private interests are concerned; and in such cases it unfortunately often happens, that the arguments of the pocket far outweigh the convictions of the mind. It certainly ought to be quite unnecessary to write books and take evidence to prove that an abundant supply of fresh and pure water is conducive to health. Those who require printed evidence on this point are hardly likely to be convinced by the results collected by any committee, however learned its members may be.

As the enormous quantity of water at present collected for the daily supply of London, and which is evidently not sufficient for the increasing wants of the inhabitants, is, in fact, the drainage water from a large surface of land, all plans for increasing the supply are, to a certain extent, interesting to those whose land is thus drained, as well as to those for whose especial benefit the water is to be collected. The valuable inquiries into the absorbent power of soils, to which we have on several occasions lately drawn attention, show that though there is little fear that the drainage water which has passed through even a thin layer of soil, can possibly carry off any ammonia, phosphoric acid, or other valuable component of manure, yet that it is pretty certain to hold more or less lime in solution. In comparing together the respective merits of different sources of water, much is said as to the proportion of lime which they contain, and as to the effects due to the presence of that substance. Now common sense tells us that hard water, which contains much chalk or gypsum in solution, is not so fit for domestic use as that which contains only a little. Every one knows the difference between the two in washing, the cook finds the difference of hard and soft water in all her operations; the gardener soon finds the disadvantage of excess of lime in water when he

syringes his plants with it; and in fact every one is more or less practically aware of the superiority of soft over hard water.

We do not see any use in taking the trouble to prove such a self-evident fact, and the less so if, in the inquiry, errors are stated as well as truths; for, in this way, the value of all evidence becomes proportionably weakened. It is better to state a practical and well known fact plainly and simply, than to attempt to prove it by questionable theoretical data. It is certain that in washing with hard water a good deal of soap is wasted, and a good deal of useless labour is expended, somewhat to the detriment of the things which are washed; but when a calculation is made as to the whole quantity of soap which is annually wasted in London, in consequence of the hardness of the water, the calculation being based on the supposition that all the soap which is destroyed by the salts of lime is entirely lost and useless; and further, that the soap itself can produce no cleansing effect until all the lime which the water contained is thus separated at the cost of the soap, it is plain that the calculation is formed on very questionable data, and is of little real practical value. In the same way most persons are willing to allow that the presence of much lime in water unfits it for a number of culinary purposes; but this is in no way strengthened by the strange and unfounded assertion that hard water takes much longer to heat than soft water does; and that soft water evaporates one-third more rapidly than such as contains a few grains more of lime in the gallon! The superiority of soft water over hard water in tea making is also pretty well acknowledged, and would be denied by few; but it surely does not at all support the statement to refer to experiments in which the chalk has been precipitated from water by the addition of oxalate of ammonia! When this is done of course the chalk is removed, and in so far the water is purified; but it must not be forgotten that all the ammonia thus added remains in the water in the state of a carbonate, and to the presence of this the increased solvent powers of the water are chiefly due.

This subject is, as we have already said, a very extensive one, and its consideration would soon lead us into matters which are foreign to our objects. Into the supply of water for domestic or culinary purposes we therefore shall not enter further; but, there are one or two points relating to its horticultural uses, which are deserving a little attention. If, as it is stated in the Report, hard water evaporates so much more slowly than pure water, it is plain that it cannot be so effective in keeping the air of houses in a uniform state of mosture. We believe, however, that this statement is wholly incorrect; when hard water is boiled, it gradually deposits a fur or earthy incrustation, which in time, as it becomes thicker and thicker, at last greatly interferes with the action of the fire; setting this aside, we doubt whether the presence of lime at all interferes with the evaporation of water, and it certainly does not at all effect its volatility at the common temperature of any hothouse.

Attention has of late years been directed to the corrosion of tanks, and hot-water pipes, by particular kinds of water; these effects are sometimes very remarkable, and the cause of them is not always quite evident. When very pure water is kept in leaden tanks, or allowed to remain in leaden pipes, it invariably corrodes them, the lead in time becoming honey-combed and useless, whilst the water acquires a slight impregnation of lead, sufficient to render it decidedly unwholesome, if not absolutely poisonous. On the other hand, when water contains a considerable quantity of saline or earthy impurity, though it then does not act upon lead, it often corrodes iron pipes with great rapidity; this sometimes is traced to the presence of a large quantity of carbonic acid and air dissolved in the water, and sometimes is caused by the salts themselves; it is also frequently caused by the presence of two metals, as where iron pipes are joined by lead, in which case a galvanic action is established, which increases the corrosion of the one metal. The inconvenience experienced in syringing plants with hard water, is for the most part caused by the presence of chalk, held in solution by carbonic acid; but such water is also often rendered hard by gypsum. Whenever it is possible, water of this sort should be altogether discarded, and pure soft water only employed; but when this cannot be procured, it may sometimes be worth while to try and soften it artificially. A little carbonate of ammonia will throw down the whole of the gypsum, and the chalk may be readily separated by boiling the water. The operation of syringing is analogous in its influence to a shower of rain, and the rain which falls in the open country is nearly pure water; the more closely the artificial process resembles nature the better.

Water, which becomes green when exposed to the air and light, is generally excellent water for most gardening purposes; it usually contains a minute quantity of phosphoric acid, and the luxuriant growth of Confervæ, on which its property of turning green depends, is chiefly to be attributed to the presence of that substance; and it is probable that the growth of water plants, and all such as are cultivated in ponds or tanks, might be improved by the occasional addition of a small quantity of some soluble salt of phosphoric acid to the water in which they grow.

---

One of the greatest obstacles in the study of plants—in cases, at least, where the aid of the microscope is indispensable—is the difficulty of preserving the minute parts and sections which have formed the materials of observation, and which require to be compared again and again, before complete conviction as to the certainty of any particular facts can be obtained. Every one who has attempted to dive into the intimate structure of vegetables, knows how hard it is to make useful sections, and that it is often practically impossible to obtain a second of equal excellence with one which a happy direction of the knife has once achieved. An easy method, therefore, of preserving such preparations would be invaluable. It is true that the plan adopted by Mr. Thwaites and others with such success, is available for a very large class of objects, but there is much difficulty in preparing both the cells and fluid in which they are to be preserved; and after all, not only is the expence considerable, and the necessity of keeping a large quantity of very brittle objects in a separate cabinet, with a very strict system of labelling, if the collection is to be of any real value, an unavoidable waste of much time, but after all, even in the best hands, the varnish is apt, after some months, to get into the cells and destroy the delicate specimens. Besides which, objects so mounted are, in consequence of the thickness of the cells, of no use for the microscopes called doublets.

A very easy and compendious method of preserving all such preparations as readily imbibe water has lately been proposed by C. Müller, which bids fair to be of great value. Slices of the very best and most translucent talc are cut of any convenient size, and made so thin that they will admit of being easily divided with a fine pointed penknife. The lamina is then to be slit to the middle, and the object inserted in the fissure with a little water. It will be found convenient if possible to make the fissure nearer to one surface than the other, and to mark the divided end by cutting off the corners. With a little practice it will be found that the division will always be effected in such a way as to secure the cohesion of the two laminæ, and the retention of the object. When the objects are wanted for the microscope it will be necessary merely to dip the marked end of the talc in water, with a pair of pincers; and by means of capillary attraction, the object will at once be properly moistened. A slip of paper neatly gummed upon the undivided end, will at once answer the purpose of a label, and will point out the upper surface of the talc, a matter of some importance where deep doublets are used, supposing the lower division of the plate to be thicker than the upper. It is clear that objects so preserved may be kept between the same sheets as the specimens from which they are taken, and will therefore be immediately accessible without any loss of time. In a collection of Mosses, for instance, and Jungermanniæ, especially where the specimens are small and unique, and where in consequence it is often impossible to examine the peristome more than once, unless the preparation can be preserved, we have an admirable method of making even the rarest individuals available for future observation.

The same method will apply to the greater part of fungi and other Cryptogams, and to a host of minute analyses of higher vegetables. It is inapplicable only where, as in Algæ, the tissues alter so much in drying as to retain few of their characters, and where the application of moisture does not make the tissues swell out to their original size. It is, however, possible that this method may be modified, so as to comprise even this important class of microscopic objects.

## ON THE HUMEA ELEGANS AS ADAPTED FOR OUT-DOOR DECORATION.

The Humea elegans for planting round or near fountains placed in the centre of a flower-garden, stands unrivalled. Its graceful drooping tresses of silky brownish orange-coloured flowers, which glitter in the sun, when moved by the breeze, give it a charm beyond description, and it is now becoming a general favourite. Although introduced from New South Wales in the year 1800, it is only of late years that this fine biennial plant has been used to any extent for out-door decoration, and it may be truly said that no plant gives more grace to the *tout ensemble* of the garden than it does. Whether as a back line to a long border of flowers, as a single specimen to let into the lawn or for the centre of a bed or vase, to form avenues on a small scale, it is most charming; and as its culture is easy, and its period of beauty extends from May till November, I think that a brief notice of it, and the best mode of cultivation, will be acceptable to your readers.

In the month of June, sow the seeds in a pan of light soil, and place it in a warm frame until the plants are in rough leaf, and then remove them into a cool frame, where they can receive plenty of air, and slight shading during hot sunshine for a fortnight, when they will be ready to pot off singly in thumb pots, using light rich soil, and plunging the pots to the rim in sand or sawdust in a cool frame. Keep them close and shaded until sufficiently strong to stand, when they must be gradually exposed to the sun and air; after which they will only require to be covered with the glass sash during cold or wet weather. Shift into larger pots throughout the autumn and following spring, as they require it, taking care never to let them become pot-bound, as their beauty is much lessened by being in any way stinted, either in pot room, moisture, or richness of soil. By liberal treatment they will retain all their foliage in a healthy green state until finally destroyed by frost. During winter, a low temperature, plenty of air, and being kept near the glass, suits those intended for planting out better than heat and a close atmosphere. Give plenty of water before turning them out of the pots, and also for a week or two after planting, until they are fairly established in the soil, which should be composed of turfy loam and well decayed manure or leaf-soil.

When kept under glass to flower in pots for in-door decoration, they are not half so beautiful as when exposed to the open air; their colour in-doors being a kind of greenish pink, which gives the plants a sickly appearance. Slightly fumigating them during the spring months will keep them free from insects, which are apt to infest the under surface of their foliage. *The Writer of the Calendar.*

## BRITISH SONG BIRDS.

(Cage Birds, No. II. *)

No. XXVII.—You will find that the sight of a nest-bag, and a peep at the two nest boxes, will soon inoculate the "happy pair" with a desire to enter upon the duties of an active life. The chances are, that the very first day they enter a breeding cage will see the nest-bag pulled to pieces, and the nest itself progressing far towards completion—the *hen*, be it observed, is the most alert in this matter.

Whilst cosily seated on the building material, and busily arranging it for the reception of her eggs (the average number of which is from two to five), the hen will keep on giving utterance to a constant succession of very peculiar, but expressive, conjugal notes. It is quite easy to see that each one of these notes is full of the "dear"-est meaning, and thoroughly comprehended by the male. His lordship, like a good husband, will be observed thoroughly attentive, tenderly affectionate, and ready, at a moment's notice, to do her ladyship's bidding. Thus, at one time, we find him feeding her, while sitting on the nest; at another time, arranging her moss, hair, and wool; and, at all times, lavishing on her the most "delicate attentions," anticipating, indeed, her every wish. So passes the honeymoon.

The mutual affection evinced by these delicate little creatures is most extraordinary. Nor do their tender endearments cease until the young ones are hatched. Then come on the cares of state. The great responsibility from henceforward devolves on the male, to whose care the hen mainly entrusts her infant brood. He has to feed them, tend them, and watch over them; while the mother flies leisurely about, and exercises herself, resolutely bent upon recruiting herself, and recovering her lost strength. If she interferes in the feeding of the young, it is by courtesy more than by an assumption of right; but there are, let me add, many exceptions to this general rule.

As the young will, generally, be hatched on the 13th day, have in readiness some soft victuals in a saucer, for their parents to feed them with—such as the yolk of fresh, hard-boiled egg, sponge biscuit, and scalded Rape seed; the whole moistened in the first instance with boiling water, but not made too thin. This should be given fresh, twice daily. A little well-seeded Chickweed, quite ripe, should also be given to the old birds at this time, twice or thrice a week at least.

When I gave a strict caution that your birds should be left unmolested and quite private whilst breeding, this had reference more particularly to the early part of the process. When the young are hatched, it will be *needful* every now and then to look at them quietly. If they appear as young birds should do, red and healthy, with their crops distended, all is well. If, on the contrary, they are of a pale sickly hue, and their crops are empty, then at once construct them, as neatly as may be, a new nest (after first scalding and drying the materials), and change the one for the other; change also the nest box. This done, carefully remove the

* Our "Treatise on the Canary" is this day completed. It is highly gratifying for me to be enabled to state, that its originality and utility, as well as fidelity and perspicuity, have been universally commended. The copious extracts from it, which have appeared, week by week, in all our principal Papers, are, moreover, confirmatory of the fact.

The Nightingale is now amongst us, waking the grove with his voice of melody. *His* praises we shall *attempt* to sing, next week—a glorious task, indeed, and worthy "of a poet's pen." I must, however, take the "lower flight;" yet need I not be altogether *prosey*.

nestlings with a warm hand, and place them in their new abode. On examining the old nest, you will find it full of minute vermin. Subject one of them to pressure under a pin's head; the blood emitted once ran in the veins of your innocent nestlings, who, from their very birth till this moment, have sustained these vermin in life! ! *Never* neglect this act of duty. You will thereby save the lives of many a parent and many an offspring. The old birds will thoroughly understand what you are about, and will show themselves well pleased when the change has been effected. I shall speak more of these vermin by-and-bye.

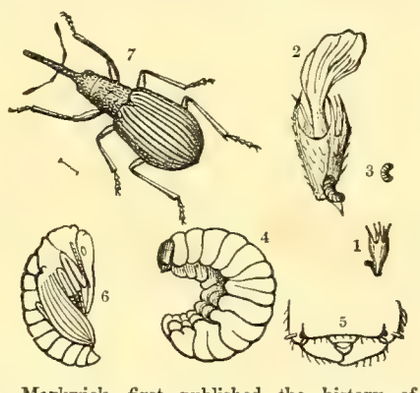
Before your first brood can well feed themselves, it is more than likely that their Papa and Mamma will be anxious to extend the branches of their family tree. This is why I recommended your cage being furnished with *two* nest boxes, in two separate divisions. Keep the cage, therefore, well cleaned, and the bottom well covered with bruised mortar and chalk.

When the nestlings are about a month old, their parents have an odd way of getting rid of them—viz., by pecking at them, and hunting them about all over the cage. They look at them as if they were interlopers, and quite able to get their own living. This is, therefore, the proper time for removing them into separate habitations. Place them in mahogany cages, made precisely as I have already recommended (See "British Cage Birds," No. 3), and hang them up in a warm situation. In a few days the males will freely "record" their song, and give full evidence of the pleasure they feel in being possessed of "a house of their own." As young canaries are very imitative, and copy all they hear, let me again advise their being made the associates of none but first-rate songsters, from their very infancy. It is more difficult to *un*learn than it is to teach. As for the hen birds, unless you retain a few of the strongest for the purpose of breeding from them at a future time, they should be got rid of with all convenient haste. They are perfectly useless.

With respect to hybrids—I have taken no notice of these, under this head. Goldfinch-mules and linnet-mules, being bred in a different manner, will receive full notice under the respective *Treatises* on the "Goldfinch" and the "Linnet." These birds may be reared to immense advantage; and if well taught in their infancy, their value can hardly be stated. They will live to a "green old age."

I should here remark, perhaps, that the change of diet, from soft to hard food, should not be too sudden. Place some of each kind in the cages of the young birds, and withdraw the "nursery diet" by degrees. Be sparing with your green meat, and also any little luxuries that may act too violently on the internal machinery of your pets. Avoid both sugar and hemp-seed; giving them occasionally a little maw-seed, German paste, sponge-biscuit, and stale sweet bun. Thus instructed, you have it in your own power to rear some of the finest song birds that were ever known. You may, moreover, live perfectly independent of the whole tribe of bird-dealers, with whom, *entre nous*, the fewer dealings you have the better. *William Kidd, New Road, Hammersmith.*

## ENTOMOLOGY.



### The Pear-shaped Weevils.—No. II.

The Ulex nanus is occasionally attacked in France by one of the small Pear-shaped weevils, which deposits its eggs in the thin twigs, thereby causing the formation of galls, somewhat like beads strung on a string, at greater or less distances apart. We are indebted to M. Perris for the discovery of this curious economy in an insect of this group, no other species having been observed to form galls, which do not, however, appear to prevent the growth of the plant. If one be opened soon after it is formed, the interior is found to consist of a green tissue, more succulent towards the centre, where a small yellowish egg is to be seen; soon afterwards this egg produces a larva or yellowish grub, which by gnawing away the substance of the gall (which serves it for food) forms a more or less spacious cavity, within which it resides. During this period the substance of the gall becomes more dry and compact, the outer coating forming a crust or shell having nearly the consistence of wood. The caterpillar is of a very long oval form, yellowish in colour, smooth, and destitute of legs; the head small, of a reddish brown colour; the jaws strong, horny, and bifid. The body consists of 12 segments, each of which, except the 2d, 3d, and 12th, are provided with a pair of breathing pores. The pupa is naked (that is, not inclosed in a cocoon), of a yellowish tint, the parts and limbs of the perfect insect being easily perceivable; the legs folded on the breast and belly, the elytra applied to the sides and striated, with the wing-cases extending beyond them. The perfect insect, to which M. Perris has applied the name of *Apion Ulicicola*, measures about one-sixth of an inch in length; it is entirely of a deadish black, covered with short grey pile; the snout is glossy, the thorax roughish, and the elytra striated.

This insect passes the winter state in the form of a larva, which changes to a pupa in the spring, the final transformation to the perfect state taking place in May and June. The larva of this beetle is occasionally attacked by a beautiful little hymenopterous parasite (Eulophus Ulicis, Perris), which deposits sometimes as many as five or six eggs in the gall when the larva has attained a considerable size, thus dooming the unlucky inhabitant to the cannibal attacks of such a number of these voracious parasites. (Annales Soc. Ent. de France, 1840, p. 90, Pl. 6, I.)

At the beginning of last February I received from H. T. Stanton, Esq., several pods of the common Furze, each of which contained several specimens of Apion (Oxystoma) Ulicis, alive and in the beetle state, remaining within the pod until it should burst and allow them to escape, they appearing to make no attempt to do so by gnawing holes through the skin of the pod. It was thence evident that they had been reared within the pod, the larvæ having fed upon the seeds, which were much gnawed. In one of the pods I found a small white footless grub enclosed in a slender cottony cocoon, the front of the body of this grub being much more attenuated, the segments of the body more constricted, and the mouth without well developed jaws, under jaws, &c. These characters, together with the circumstance its of being found so late and at a time when the real inhabitants of the pod had assumed the perfect state, is sufficient to prove that the small grub in question is not the larva of Oxystoma Ulicis, but of a hymenopterous parasite, which keeps it in check. The perfect Oxystoma is found almost throughout the year, and is very common where the Ulex europæus abounds.

The various species of Clover and Trefoil are subject to the attacks of several species of Apion. Thus Apion assimile devours the leaves and heads of Trifolium ochroleucum; Apion meliloti is found on Trifolium melilotum. The larva of Apion flavipes devours the heads of Trifolium repens, and Apion flavifemoratum (alias A. Trifolii and A. africans), does much mischief to corps of Clover, Trifolium pratense.

Mr. Markwick first published the history of this species in the sixth volume of the Linnean Transactions. On examining the state of a crop of Clover, in the month of August, he found in many of the heads several small white grubs, invariably placed on the outside of the base, beneath the individual calyx of each floret, eating through the bottom, and thereby destroying the germen or rudiment of the future seed. These larvæ were like the nut grub in miniature, having a white body, black head, and three small prominences or tubercles on each side of the breast, supplying the place of legs. Having placed a number of the blighted heads of Clover in a box, he found, 10 days afterwards, a number of the Apions running about, as well as many of their "chrysalids sticking to the stem at the base of the individual floret, exactly in the same position as I had found the larvæ; nay, I even saw one or two of these weevils crawl out from their chrysalids. Under these circumstances, there can be no doubt that the before-mentioned larva changes to a small white chrysalis, which differs but little from it, except in being egg-shaped and motionless, and this produces a small blackish weevil with a long beak, whitish belly, and yellow legs." Mr. Markwick adds, that, in 1798, 4½ acres produced 16¾ bushels of Clover seed, worth 41*l.* 17*s.* 6*d.*; whereas in 1800, when the field was attacked by the weevil, the same quantity of ground produced only 7½ bushels, worth 18*l.* 15*s.*, the deficiency of 9¼ bushels, worth 23*l.* 2*s.* 6*d.*, being attributable to the devastations of the Apion flavifemoratum.

Mr. Markwick's account of the pupa state of this insect is not very clear, since he speaks of it as an egg-shaped chrysalis, very like the larva; and adds that he saw the Apion creep out of the chrysalis—statements which seem to imply that the pupa state was inclosed in an egg-shaped covering or cocoon, which is, in fact, the character given by Mr. Kirby in his subsequently published monograph on the genus. M. Perris, however, expressly says that the pupa is naked, and such was the state of the pupa which I found in the pods of Lathyrus arvensis, described in my former paper. Mr. Lehmann also, in his additional observations on the Clover Apion, says, "that having consumed three or four of the seeds, it remains in the place of the last, where it is sufficiently sheltered, and changes like other weevils into the pupa or chrysalis state, through the transparent skin of which an experienced eye may trace the different limbs of the future animal;" thus fully proving that the chrysalis of Mr. Markwick, and the pupa folliculata of Mr. Kirby, is a naked pupa, not enclosed in a cocoon.

A still more precise account of the transformations of this insect has been published by M. Guérin Méneville in the Annales of the French Entomological Society (1843, p. 65). Our figures 1 to 6 are copied from M. Guérin's illustrations; those given by Mr. Markwick being so small as to be quite unintelligible. M. Guérin adds the interesting fact that the larva of this Apion is kept in check by two small hymenopterous parasites, namely, the Calyptus macrocephalus of Nees, and the Pteromalus Pione of Walker. Our figures 3 and 4 represent the larva of the Apion Trifolii or apricanus of the natural size and magnified; figure 5, the front of its head more strongly magnified; figure 6, the pupa magnified; figures 1 and 2, a floret of Clover, pierced by the larva, of the natural size and magnified; and figure 7, the perfect insect magnified, the natural size indicated by the line below the figure. *J. O. W.*

## Home Correspondence.

*The Chrysanthemum, a spring-flowering Plant.*—The following plan of culture was practised by me in 1836 and 1837, and on the 10th of May, 1837, I gained a Banksian Medal at Chiswick for a Chrysanthemum, having 60 blossoms on it, all open at one time. The sort was the Paper-white, and it was perhaps the only Chrysanthemum ever seen in flower at so late a period. In the month of April I took as many suckers as were wanted, and planted them out in well prepared ground, about 2 feet apart. As soon as they began to grow I topped them, and continued doing so with each succeeding growth, until the plants began to get shrubby, in which condition they needed no stakes. If a succession of plants was wanted to blossom late, or in the commencement of the next year, I kept topping a few for the purpose; and in dry weather I watered them with weak manure water. I potted my plants on the 1st of September in 8 and 10-inch pots, and started them by putting them into a close house, or pit, for seven or eight days, until they had made young roots, excluding all direct sunshine, and syringing them twice a day. My Chrysanthemums that season were very fine; plants in front of a conservatory had scarcely lost a leaf on the 5th of December, and about 40 of them had not opened all their flowers; several of those which did not show bloom were put into the stove, and one of them gained the Banksian Medal in question. Now what was done then can be effected now, and during the season of growth the stem can be made to grow either long or short at the will of the cultivator. I see no reason why a Chrysanthemum should be trained up a stick, with half the stem naked, detracting from the beauty of the plant. Great improvement has been made in the blooms, but none in training, while by proper management a long succession of those beautiful winter flowers may be obtained. *James Cuthill Camberwell, London.*

*Management of Timber Trees.*—Having lately made a tour through some parts of Essex, Herts, and Cambridgeshire, I had an opportunity of observing the way in which forest timber is managed in these districts, but in no instance could I see the smallest approach to scientific culture, so as to produce useful timber. It may truly be said that in England there is no science less practically understood, or one that meets with less encouragement, than the management of forest timber. At the formation of the Royal Agricultural Society of England, it was stated that one of the objects that Society had in view was to encourage a better method of cultivating timber plantations; but where is there an instance of any improvement having taken place? In 19 out of every 20 cases the whole management of forest timber is left to persons who never received any instructions in the art. Under such circumstances no improvement can possibly be expected. In walking through a young plantation of 10 or 12 years' growth, that had just undergone a course of thinning and pruning, the axe had been used very lavishly, and without any regard to the future growth of the permanent trees, or the value of the nurse plants, two-thirds more of the latter being removed than ought to have been cut out at any one thinning. In the pruning, every branch and twig from the ground to three parts up the trunk, had been hacked off, some of them close to the stem, others 3 or 4 inches from it, and in some cases the pruner, by his awkwardness in missing his aim, had cut the tree half asunder, leaving the greater number of the deciduous trees like a mop stuck on the top of a pole, with six or more competing shoots. By such injudicious management, if the trees are left in their present condition, as in all probability they will be, there being no person on the estate that can point out the proper method of repairing the injury, such trees will, when cut up into planks, exhibit the effects of the treatment they received in their youth. *J. D.*

*Memoranda from Java.*—This is one of the finest and most fruitful of the Sunda Islands. Its form is nearly that of an oblong square, which is traversed from east to west by a chain of large mountains; these exhibit the remains of ancient volcanos, which are now clothed with the vegetation of many ages. The fine new species of Rhododendron lately introduced into England are inhabitants of such situations. The mountains, in most instances, are covered with almost impenetrable forests, and with a few exceptions, the soil on them is fertile. Between those of the first or grand, and those of the second series, are immense plains, some of which are much elevated above the level of the sea, and on these the cold is sensibly felt. They are the most densely inhabited and best cultivated portions of the island. In some parts the heat is oppressive, rising occasionally above 107° Fahr., with from 20° to 25° variation in 24 hours. Notwithstanding this, however, taking it altogether, the climate away from the swamps is healthful and pleasant, the perpendicular sun-beams being considerably cooled by the sea and land breezes. On the tops of some of the mountains it is not uncommon to find the temperature in the months of May, June, and July below 29°, and occasionally even lower, and ice ¼ inch thick may often be discovered on the ponds. The two monsoons, the dry and the wet, are latterly not at all regular. The

former, during which easterly and south-east winds prevail, generally commenced towards the middle of April and continues until November, and sometimes as late as December. The rainy season is accompanied by westerly winds, and both monsoons by severe thunderstorms; but more especially the wet one. The land is richest near rivers and in valleys, and even near towns, where it is employed in the production of vegetables; it requires very little manure or labour to cause it to yield heavy crops. Java produces Rice in large quantities, Coffee, Sugar, Pepper, Indigo, Cochineal, Nutmegs, Cinnamon, Maize, &c. The latter is grown on the hilly parts, where it is too cold for Rice. Maize does not suffer from cold until the temperature falls below 45°, and on the other hand no degree of heat is injurious to it. It supplies the natives with the greater portion of their food. *John Henshall.*

*Franciscea confertiflora.*—This fine species is well worth a place in every stove, on account of its handsome trusses of deep lilac flowers, and excellent habit. I have one now under my care, 2 feet high, and 2 feet 5 inches in diameter; it has 20 shoots, 7 of the strongest of which are bearing trusses of about 30 flowers, each blossom being an inch and a half across, while the smaller shoots bear trusses, consisting of from 6 to 25 flowers; when these fade, more succeed them; the shoots grow erect, and the blossoms stand well up, and are slightly scented. My plant has been in blossom these three weeks; the colours of the blooms do not change to so light a tint as in the case of the broad-leaved Franciscea, and the species is of much better habit, and grows more freely; the foliage also is much handsomer; it has not at the present time dropped a leaf from the lower branches, the loss of which is so detrimental to the appearance of the Franciscea latifolia, when it attains a considerable size; the leaves of the Franciscea confertiflora are a handsome fleshy dark green waved, and rather larger than those of Franciscea latifolia; it has been grown in three parts turfy peat, and one part burnt loam and silver sand. *W. K., Knowsley Hall, Lancashire.*

*Conifers.*—With regard to the notice on the growth of Conifers at Dropmore, I would add my opinion that the common notion of the quasi-identity of Juniperus Bedfordiana, Gossainthania, and Virginiana is erroneous; knowing the two former as yet only in the state of bushes, they certainly appear very distinct from any of the varieties of the red Cedar that I have seen. Jun. Gossainthania rather approaches the character of Jun. Bermudiana, of which I have a young tree nearly 18 feet high. *S.*

*Span-roofed Pineries.*—Has any person tried a span-roofed house running north and south (passing east and west) glazed with rough plate glass, for fruiting Pines in the winter? If not, will such a form of house answer better with sheet glass? And is there any objection to such a situated house? It is submitted that there would be plenty of light at all times, and no necessity for shading in summer. *W. W.*

*Stoke Newington Chrysanthemum Society.* — Mr. Nicholls having been compelled through visual infirmity to relinquish the office of Secretary to this Society; the members, with a view of testifying their appreciation of his past services, met at the Rochester Castle, on Thursday, the 17th, to present him with an elegantly chased silver drinking cup, bearing the following inscription:—"Presented to Mr. John Nicholls by the members of the Stoke Newington Chrysanthemum Society, as a token of their esteem and regard:" Mr. Croxford presided, faced by Mr. E. Sanderson. The former, after adverting to the services Mr. N. had rendered the Society, and regretting the cause of his retirement, presented him with the cup, which was then filled with wine and passed round the company. Mr. Nicholls returned thanks in an appropriate speech. *E. Sanderson, Hon. Sec.*

*Renovating Old Trees.*—The advice which the late Sir Henry Stewart communicated in a letter to Admiral Sir T. Livingstone, Bart., on the renovation of decayed trees, may be also useful to your correspondent "Nemus," if applied to his Beech trees. Sir Henry says, "Agreeably to my promise I shall now give you an idea of my method of reviving or resuscitating old trees, which has often succeeded with myself, and which I here recommend to others; but there is no account given of it in the notes in my treatise on the 'Application of the Science of Physiology to Practical Tree-culture,' and particularly in removing large trees for ornament. The decay of old trees, both in England and Scotland, has been a subject of general complaint, during at least a century, and it is observed with regret that their place does not promise to be very speedily supplied by existing woods and plantations. The general cause of the decay of trees are twofold, the first proceeds from diseases to which all woody plants are subject, the second from extreme old age, but more frequently from their having exhausted the pabulum within their reach. The pathology of the vegetable tribe in this respect differs materially from that of the human species. Among the sons of the forest there are no vicious efforts made by individuals, as among us, by means of disease, to shorten life; there are no gourmands nor sensualists, by fatal indulgence and artificial luxuries, to bring on a premature old age; the laws of Nature in trees are allowed freely to operate, and their existence therefore may be reckoned on, and even prolonged by art to an indefinite period. It has been said that the roots of trees in a favourable soil will go abroad in search of their food to a distance from the stem equal to the entire height of the tree taken from the ground; and wherever this is found to hold good, trees will live to a very great age, especially in a deep and calcareous soil. Of your two fine old trees at West Quarter in Stirlingshire, which I lately examined, a Holly and a double-flowering Thorn, I must say that they appear to me to have declined chiefly from the latter of the two causes above-mentioned, namely, their having exhausted the food or pabulum in their immediate neighbourhood; and in the case of the Thorn, in some measure, from the ground being overstocked with other plants that greatly crowd upon it, even to the exclusion of light and air, without which no plant can flourish. As to the Holly, it seems stunted, and hide bound, and sends out no free shoots at top, such as a tree in health, in so fine a soil and climate, ought to do. The terminal growths of the Thorn also have begun to decay, and if some salutary remedy be not speedily adopted to excite the roots to fresh action, it is plain that the evil will ere long extend to the greater branches, and as a necessary consequence to the trunk itself." He then recommends the clearing away of the Ivy from the stem of the Thorn, and to clear the ground for a considerable space of overshading shrubs and bushes; secondly, to dig a trench round the tree not exceeding three and a half or four feet out from the stem, the trench to be five feet broad, and deep enough to penetrate the soil and subsoil; in doing this, the workmen may fearlessly cut through all the roots they meet with, leaving only three or four great ones on the south and south-west sides, to act as cables in resisting the severe winds that usually blow from those quarters in every part of the island. The good earth from the trench is to be saved, and [the bad wheeled away, the trench is to be filled with well prepared earth and dung, so as that a proper chemical action may be excited throughout the mass, and the whole rendered fit for the food of plants; all dead wood is to be removed carefully with a saw, all moss in the spring is to be taken from the bark, and the stem well marked two or three times during the summer season, with soap and water, and a soft brush. By following the above method, which, however elaborate it may appear in the description, will be very easily reduced to practice, I feel confident that many fine old trees in gentlemen's parks, that are now allowed to decay, might have another century added to their existence. In a tree of considerable age, it is to be observed, that much figure cannot be expected to be made the first year in the elongation of its terminal shoot; and for this plain reason, that effects must necessarily be preceded by their causes, whether they lie on the surface or otherwise; but the leaves will speedily become larger, and of a deeper green colour than for some years past; and by the autumn of the second year, it will be admitted that the tree is in some sort about to renew its growth. In conclusion, he adds, the month of February, or beginning of March, according to the season, before the ascending sap begins to stir, would, of course, be the best time to carry into effect the method of resuscitation above detailed. *P. Mackenzie.*

*The Calceolaria.*—This is so lasting and beautiful a plant that a few words respecting its cultivation may not be unacceptable. It may be propagated either by cuttings or seed. The latter is undoubtedly the best plan. The seeds should be sown about the beginning of August, and placed in a shady situation—in a Vinery, for instance. If properly treated, the seedlings will be fit to transplant into small pots on the 1st of October. They should be placed in heat for a few days, and afterwards removed to a cold frame or pit, which can be kept free of frost without the use of fire-heat. When they have become established in small pots, shift them, about the 1st of January, into the pots they are to flower in—8-inch pots are the best. They succeed well in a soil consisting of five-eighths charred loam, one-fourth rotten leaf-mould, and one-eighth peat, to which should be added a little silver sand. When they receive their final shift they should be placed in a cold frame on a good bed of coal-ashes, in order to keep slugs and worms away from them. At the same time air should be given on all favourable occasions, and as the spring advances they should be liberally supplied with water, syringing them occasionally, to keep down green fly. The plants should remain here until the blossoms begin to expand, when they should be removed to the house in which they are to flower, where they should have plenty of air, and they should be shaded in sunny weather. *M. P.*

*Culture of the Chrysanthemum.*—I read with interest the lecture on this subject, delivered by Mr. James, before the Stoke Newington Chrysanthemum Society, and it is not my intention to find fault with that essay, because I have never seen Mr. James's plants; at the same time I cannot think that his system will produce such good Chrysanthemums as I have been in the habit of seeing during these last three years in a neighbour's garden. I will describe them as near as I can. The plants are about 18 inches high from the pots, with from 12 to 18 shoots, each of which produces a bloom as large as a Dahlia. Some of the blossoms have measured 6 or 7 inches in diameter. All who have seen them have expressed their admiration of them, and have said they never saw anything of the kind to equal them. I have been growing my Chrysanthemums on the same plan for these last two years, and I am confident that they can be grown and flowered every year with as much certainty as any other florists' flower. I am of opinion that if the proper culture of this plant was generally known we should soon hear of Chrysanthemum shows all over the kingdom. I am anxious to see this take place, and I trust that my neighbour, who is Mr. Ivory, gardener to G. Grout, Esq., Tring Park, Herts, will give the public the benefit of his mode of cultivation, in the shape of a small pamphlet, say at a shilling, and it would be honestly worth 5s. to any gardener who wanted to grow dwarf plants. The old system of management is altogether wrong. *Henry Coombs, Gardener to T. P. Halsey, Esq., M.P., Great Berkhampstead Hall, Herts.*

*The Sweet Chestnut as Timber.*—In turning over the pages of some of the early volumes of the "Transactions of the Horticultural Society," a few days since, I met with the following passage in a paper, read before the Society, by W. Atkinson, Esq., Jan. 15, 1833, which may possibly be of service in elucidating points relating to the durability of the Spanish Chestnut as timber:—"The Quercus sessiliflora contains so small a portion of the silver grain or flower (?), that wood of that kind from old buildings has frequently been mistaken for sweet Chestnut. During the last 30 years I have taken every opportunity of procuring specimens of wood from old buildings, and particularly what the carpenters called Chestnut; but I have never, in a single instance, seen a piece of Chestnut from an old building. What has been taken for that wood I have always found to be Quercus sessiliflora, mistaken for Chestnut." The author then alludes to the roof of Westminster Abbey, about which so much has been said. He tells us that during some repairs he procured portions of the wood, and that it was Quercus sessiliflora, beyond doubt. While this note has lain upon my desk, I have asked an old carpenter, who is working within a few yards of me, what his experience will allow him to speak in favour of the wood of the sweet Chestnut, for durability; his answer was to the effect that it was second only to Oak. *G. L.*

*Adulteration of Condiments.*—It appears that pepper, mustard, arrowroot &c., are not the only articles deteriorated by dishonest tradesmen and dealers. A report issued by the Pharmaceutical Society, describes an ingenious, but unwarrantable system of adulterating isinglass, an article extensively used for fining purposes, and for preparing the luxuries of the wealthy classes. Russian isinglass is the air bladder of the sturgeon dried, rolled into thin sheets, and cut into very fine shreds. The system of adulteration detected, consists in rolling out common gelatine in a similar manner, and placing one sheet of the spurious matter between two of isinglass. After cutting the deception is very difficult of detection, but it may be marked by a comparison with the really genuine specimen, or by the disagreeable gluey flavour of the adulterated article when dissolved in boiling water, and tasted without sweetening. The prepared gelatine alluded to is about 15*d.* per lb., while the value of isinglass averages 17 or 18 shillings. *Thomas H. Collins, 2, College-place, Chelsea, April 15.*

## Societies.

National Floricultural, *April* 24.—R. Stains, Esq., in the chair. Fifty new members were added to the lists, and 28 more were proposed for election at the next meeting, making the total number of members 175. As regards subjects of exhibition, there was a goodly display of Cinerarias, a few Pelargoniums, some Rhododendrons, Auriculas, and Pansies. Messrs. Henderson, of Pine-apple-place, sent a collection of Cinerarias, in which the best were Pauline, Lettice Arnold, Madame Sontag, and Lady Gertrude. Mr. Ivery, of Peckham, had, among others, Ormsby Beauty, Electra, and Blue Perfection. Mr. E. G. Henderson, Wellington-road, Pauline, Brilliant, Charles Kean, Formosa, Effie Deans, Lady Hume Campbell, Georgiana, Amy Robsart, and Enchanter. Pansies, in the shape of cut blooms, were furnished by Messrs. Edwards, Turner, and Bragg; and Mr. Turner also showed six Auriculas in pots. Mr. Henderson had some variegated Pelargoniums. Mr. Ayres again showed his crimson-flowered Oak-leaved Pelargonium, and the fancy kind, named Lady Rivers. A Rhododendron, called Jacksoni, came from Messrs. Jackson, of Kingston. In appearance it was somewhat striking, being deep blush, striped on the outside with rosy pink. Among seedlings a Certificate was awarded to Mr. Hoyle, of Reading, for Pelargonium "Chieftain," a variety having a good habit and well formed flowers, whose upper petals exhibited a dark crimson blotch margined with scarlet, while the lower petals were vermilion. Mr. Turner had a Pelargonium named First of May, which was commended for form of flower and habit. The upper petals consisted of a dark crimson blotch edged with rose, the lower ones being rose blotched with crimson. A fancy Geranium called Formosissimum, from Mr. Ayres, was good in form, truss, and habit, while in colour it was an improvement on Anais. The same grower had also a promising variety named Gypsy Queen. Among Cinerarias a certificate was awarded to Mr. Smith, of Hornsey, for Alba Magna, a good white with a dark disk. Ditto to Mr. E. G. Henderson, for Marianne, a medium-sized white-ground flower, with a lilac edging; habit fair. First class ditto to the same, for Marguerite d'Anjou, whose habit and general symmetry were good. Flowers bold, rich crimson, surrounding a dark disk. Model of Perfection from Mr. Ayres, was commended, for fine form and novelty of colour, which was shaded purple. Beauty, from Mr. Ivery, was also commended for its habit and white flowers faintly margined with lilac. Lady of the Lake, from Mr. E. G. Henderson, was good; but it was not sufficiently distinct from Cerito. An Auricula from Mr. Griffin, named Beauty of Bath, received a first class certificate. It was a grey

edged flower, of good substance and outline, and well proportioned. We noticed among other things some seedling Heaths on the table; but though very pretty they were not sufficiently distinct from aristata to deserve distinction.

Royal South London Floricultural, *April* 23.—This exhibition, the first of the season, was held at the Horns Tavern, Kennington. Few stove and greenhouse plants were produced, and as a florist show, it was certainly inferior to former years. For the best pair of Auriculas in the amateur's class, the first prize was awarded to W. S. Ginger, Esq., for Litton's Imperator, and Oliver's Lovely Anne; 2, to Mr. Moseley; 3, Mr. Chapman. Nurserymen: 1st, Mr. Turner of Slough, for Ringleader, Squire Chilman, Prince of Wales, and Conqueror of Europe. 2, Mr. Dickson, of Acre-lane, Brixton, for Ringleader, Oliver's Lovely Anne, Hedge's Britannia, and Taylor's Glory. Several collections of Auriculas were shown, and some Polyanthuses, among which we remarked Pearson's Alexander, King, Princess Royal, and Buck's Geo. IV. Pansies: Amateurs: 1st, J. Edwards, Esq., Holloway; 2, Mr. Parsons, Enfield. Nurserymen: 1, Mr. C. Turner, Slough; 2, Mr. Bragg, ditto; 3, Messrs. Hart and Co., Guildford. The leading flowers shown were—Hales' Sir R. Peel, Duke of Norfolk, Ophio, Rubens, Bertha, Mr. Beck, Leader, Almanzor, Juventa, Disraeli, Mrs. Hamilton, Addison, Supreme, Queen of England, Mrs. Beck, Robert Burns, Miss Edwards, Privateer, Climax, Ibrahim Pacha, Thisbe, Zabdi, Elegant, and Sir John Franklin. Dora and Euphemia are two large showy seedlings, which will make fine varieties for exhibition, and must be constant, from the number of blooms shown. A nice collection of Cinerarias was exhibited by Mr. Robinson, and there were also a few seedlings, for which a first-class certificate was awarded to Mr. Smith, of Hornsey, for Queen of Beauties, a small white flower with a dark centre.

## Garden Memoranda.

Horticultural Society's Garden, Turnham Green.—The large mass of Phalænopsis amabilis, which Mr. Fortune obtained from Manilla, is now, as it nearly always is, beautifully in flower in the Orchid-house; as are also the Skinner Cattleya, (bearing 10 spikes of highly coloured purple blossoms), several Oncids, and a few Dendrobes. In the adjoining greenhouse, we remarked, among other things, the great-headed Gueldres Rose (Viburnum macrocephalum), and the double white flowered Chinese Peach—introductions whose value in the arboretum has not yet been tested; but from both of which much may reasonably be expected. Forsythia viridissima was also in flower in this house, as well as against the open wall, on which it requires about the same treatment as a Peach tree, and for a south aspect, in a somewhat sheltered situation, few wall plants are more effective. In the new house, which has lately been erected for the more speedy and abundant production of plants for distribution, were nice young examples of Sikkim Himalaya Rhododendrons, raised from seeds presented to the Society by Sir William Hooker. The two-coloured Cantua was in flower here, as were also the white-blossomed Eranthemum, than which a better winter flowering plant hardly exists; the scarlet Scutellaria, Tetranema mexicanum, Manettia cordifolia, the ever-flowering Achimenes picta, and the useful Turnera elegans. In regard to the plunging material employed in this house, it has been found that sawdust by itself does not answer near so well as when it is mixed with coal ashes or cinders. Managed in this way it is rendered more porous, and permits the heat to permeate it more readily. The Camellias planted against the north side of the wall, which divides the small flower garden in front of the glass houses from the experimental ground, have bloomed beautifully this year, and at present one of them is quite loaded with flowers. A spreading bush of C. reticulata, planted out in a wooden box in this garden, where it can be covered with a glazed sash at night, and, in the event of unfavourable weather, is quite a mass of rosy pink; and this has been the case with it for weeks past. Where Camellia blooms, in a cut state, are wanted in quantity, a better plan than this could hardly be adopted for their production. The Camellias in the large conservatory have likewise flowered well this year, as have also some of the fine leguminous plants and Rhododendrons which the house contains. In order to slightly increase the vigour of the Luculia gratissima, planted out in the bed here, where it has blossomed profusely and beautifully, every winter for years, a trench has been taken out round it, and new soil added to its roots. Its top was also at the same time pruned in, and it is now beginning to make young wood freely. The appearance of the arboretum has been much improved by the removal, where they had become too thick, of some of the less important kinds of trees; the walks have been all newly gravelled and rolled, and the Grass on the lawn closely cut. The small walk running along the bottom of the conservative wall has been widened and straightened by the removal of a short cross wall, against which the large Arbutus procera grew; the latter has been formed into a standard, the conservative border has been made narrower, so that the plants on the wall can be conveniently examined from the walk, and, in addition to the advantage, the effect of all this has been to materially improve this part of the garden. Following the broad boundary walk which has been completely gravelled, and furnished at short intervals with seats, the borders at the same time being entirely re-arranged, and planted copiously with Berberis aquifolium for ornamental under growth, we arrive at the new flower-garden. This is now completed, and in June it will be the scene of an exhibition of American plants, by Mr. Hosea Waterer, of Knap-hill. The Rhododendrons are already nearly all planted, and, judging from their size and appearance, as well as from the varied surface—the miniature hill and dale—supplied by the formation of the ground, a display may be anticipated such as has never before been presented by an exhibition of the kind. But this is not the only purpose for which this ornamental ground has been formed. It is intended to be a "garden of flowers" all the year round, and to this end it has been, and will still be, furnished, as opportunity offers, with such plants as will best carry out that object. In preparing an eligible site for an American show, however, improvements in the conduct of the ordinary exhibitions have not been lost sight of; for 150 feet of new tent have been added for the better accommodation of plants. The iron tent will be altered so as to suit Geraniums, and for the large collections which used to be shown there, two stations, which advance from the general line of tables, have been formed in one of the long tents. By this arrangement it may be expected that a more effective exhibition will be produced. In the orchard little alteration has taken place since our last report. The buds of the different kinds of fruit-trees have been thinned considerably by the sharp frost which occurred on the night of the 6th and morning of the 7th inst., when the thermometers registered 11° of frost; but we are glad to state that sufficient yet remains for a crop.

## Miscellaneous.

*Hartley's Rough Plate Glass.*—The importation of glass into France is at present prohibited. Special permission has, however, been granted by the French Government for the introduction of a quantity of Hartley's Patent Rough Plate, for experimental purposes, on the application of some influential horticulturists, who have witnessed the results attained by the use of that article in this country. *Sunderland Herald.*

*Baked Potatoes.*—It is computed that there are 60 tons of baked Potatoes sold in the streets of London every week during the season, viz., from September till the beginning of April. The average takings of each vendor is 6*s.* a day, and the receipts of the whole number throughout the season are supposed to be 14,000*l.* *Cornwall Gazette.*

*Sale of Orchids.*—A small collection, just imported, consisting chiefly of Dendrobes, and the magnificent blue Vanda (V. cærulea), was sold last week by Mr. Stevens. The Vandas fetched from 2*l.* to 10*l.* 10*s.* per plant, and the Dendrobes from 10*s.* to 5*l.* 5*s.* A few Aerides, Cœlogynes, Saccolabiums, and Cymbidiums, were also sold at the same sale, at prices varying from 10*s.* to 3*l.* 15*s.* per lot.

*Death of M. Wahlenberg.*—From Stockholm is announced the death, at the age of 71, of the distinguished botanist and geologist, M. Goeran-Wahlenberg, Professor at the University of Upsal, and director of the botanical garden in the same institution. M. Wahlenberg is stated to have spent 30 out of his 71 years in scientific journeys throughout the different countries of Europe; and the results of these travels he has recorded in a variety of learned works. M. Wahlenberg has left his rich collection and numerous library to the University of Upsal, in which he was a student—and to which he has been attached in various capacities during upwards of 43 years. *Athenæum.*

*On the Nature of Cork. By Professor Mit cherlich.*—Cork, which is next to cellulose, the most important constituent of the cell-wall, is so difficult to obtain in a state of purity, that the author does not venture at present to express any opinion upon its composition; when obtained in a pure state, another name must be given to it. It sometimes forms a thin, shapeless continuous coating of the entire plant; sometimes it constitutes the outermost cellular layer of the stem; very often it forms several cellular layers, as in the Potato. In the latter it forms a row of cells, readily distinguishable both by their structure and chemical reactions from the subjacent cells containing starch; the number of superimposed layers is different in different varieties of the Potato. This layer is easily separable from boiled Potatoes, and from the cells consisting of cellulose, which are filled with starch. This substance is very readily distinguishable from cellulose by its reactions with nitric and sulphuric acids. Concentrated sulphuric acid, which immediately dissolves cellulose, does not act upon this substance until the lapse of a very considerable time; thick cell-walls resist its action longer than thin ones; at last, especially on the application of heat, brown products are formed. Nitric acid of 1·2 spec. grav. oxidises it, even below the boiling point of water; the cells first swell, and the product is then soluble in potash; the cells soon separate from each other, and by the continued action of nitric acid a series of acids are formed, the final members of which are suberic and succinic acids. The first products are red, the colour becoming more intense when combined with alkalies; they are fusible at the boiling point of nitric acid, and soluble in alcohol. The same products are obtained, but in different quantities, when cork, the peel of Potatoes, or even the cuticle of Aloe lingua, which resists the action of sulphuric acid for several days, is boiled with nitric acid of 1.2 spec. grav. In the water-bath the corky matter is so readily oxidised by nitric acid that when cells of cellulose are mixed with its cells, the latter remain unaltered, on filtering the residue and exhausting with alcohol as soon as nitrous vapours cease to be perceptible. We sometimes meet with thick-walled cells of cellulose, which exactly resemble those of the stone of stone-fruits, but which also occur frequently in the bark of many trees and in the cork layer of the Oak. After deducting the cellulose, the ash and the substances soluble in alcohol, the corky layer of Potatoes was found to consist per cent. of—

| | |
|---|---|
| Carbon | 62.3 |
| Hydrogen | 7.15 |
| Oxygen | 27.57 |
| Nitrogen | 3.03 |

With nitric acid, 100 parts gave 6.2 parts of a fatty acid soluble in alcohol. Cork from the Cork Oak, carefully separated by excision from the brown matter running transversely across it, yielded per cent.—

| | |
|---|---|
| Carbon | 65.73 |
| Hydrogen | 8.33 |
| Oxygen | 24 54 |
| Nitrogen | 1.50 |

Another quantity of the same piece, treated in the same way with nitric acid, yielded 39.67 per cent. of a fatty acid and 2.55 per cent. of cellulose. Alcohol extracted from 100 parts of the same cork 1·15 part of a fatty matter difficultly soluble, and 5.4 of a fatty substance readily soluble in this menstruum. The cork was used for analysis without any previous treatment, and in a perfectly dried state. The composition given by Mulder for the cuticle of Agave Americana nearly agrees with the above, as does also that of cork given by Döpping. Exuberant growth of cork cells is common. In Cornus alba, and most trees, it is seen on the young branches; we either meet with a mere tumid state of the bark, or the exuberant growth increases to such an extent that rupture of the uppermost layers of cells takes place; hence as the exuberant growth proceeds to a greater extent in few plants only, lenticular glands are formed. In the Cork-Maple this exuberance is greatest on the lower branches, which are surrounded by moist air, so that a copious formation of Cork occurs upon them; it does not however form a connected layer, as in the Cork Oak. Exactly the same exuberant growth occurs in the Potato. The tuber is the end of an underground stem, which has become thickened; the stem is usually furnished with only a single layer of cork cells; the tuber itself has five or six such layers, frequently still more. Both on the stem, and especially at the tuber, small swellings are perceptible, even while both are quite young. A transverse section of these shows that they are formed by an increase of the cork cells; when coloured with iodine, they are not rendered blue by sulphuric acid; they are not altered by it, whilst the adjacent cells, which consist of cellulose, are immediately dissolved. On the further development of the tubers, the number of cells at these spots rapidly increases, and in much greater proportion than that of the other cells, so that the outermost become separated from each other. In the full-grown tubers, deep cavities or pits originate in this manner; these are covered with cork cells, but are not closely connected, so that the moisture of the soil is able to penetrate in an unchanged state to the more deeply-situated starch-cells. A process of decomposition commences at these spots, by which the agriculturist, on keeping them through the winter, frequently loses half his crop of Potatoes. The corky layer is difficultly permeated by water; it thus protects the plants, not only from liquid, which might penetrate from without, but it also prevents their drying. Potatoes, the surface of which is uninjured, may be kept for months without becoming the least flaccid, and losing scarcely anything in weight. The author has kept Potatoes in a drying chamber at a temperature slightly above 86° F. for months. Uninjured Potatoes lost about 3 per cent. in weight; the pitted ones almost twice as much. Potatoes which had been cut through the middle shrunk up in a few days, and when cut in slices they were almost perfectly dried in the same time. Even below 212° F. the cork of the Oak parts with all its water in a drying apparatus; and the small extent to which it transmits water and liquids is best shown by its common application to the closure of bottles filled with liquids. A layer of corky substance, in fact, prevents the penetration of moisture. Conviction may readily be obtained by means of iodine and sulphuric acid, that the most delicate vegetable hairs are covered by a thin layer of corky substance (cuticle). Fresh cotton-wool imbibes water with difficulty. If the corky layer be removed by chlorine, or some other oxidising agent, the wool may be moistened as readily with water as any other substance which consists only of cellulose. Before treatment with chlorine, cotton wool can hardly be impregnated with mordants; unbleached cloth becomes coloured in spots only, perhaps only between the fibres (hairs); whilst, as any one may readily convince himself by the examination of sections under the microscope, the cotton-wool fibre is coloured to the middle when it has been previously bleached. The author considers it as not improbable, that cellulose and the corky substance, with the fatty matters covering them, are secreted by the same cell; and when the cellulose has been absorbed, the corky substance alone remains; moreover that the corky substance forms the outermost part of the cell-wall, and connects (cements) the cells with each other, just as the walls of the cork cells are so thick, and so closely packed together, and so intimately connected with each other, that the wall belonging to each cell cannot be distinguished. This circumstance may also yield an explanation of the reason why the

cells of wood, the stones of stone-fruits, &c., are so readily separated from each other, which can be so beautifully effected by ebullition with nitric acid, especially when a little chlorate of potash is added to it according to Schultze's direction. *Ann. der Chem. und Pharm.* lxxv., p. 305; *Reports of the Berlin Academy*, March 1850, p. 102; *in the Chemical Gazette.*

## Calendar of Operations.

*(For the ensuing week.)*

PLANT DEPARTMENT

Stoves.—The increased amount of heat and moisture in these structures, aided by longer days and more powerful sunlight, is of course, inducing a development of new growth, and it is the province of the gardener to take care that this should be so directed as to make each individual plant approximate as nearly as possible to a perfect specimen. To this end they should be carefully and constantly watched, as every piece of neglect or mismanagement, however trifling in itself, tends in a proportionate degree to defeat the object in view. To lay down more than general rules is impossible; but it is necessary to urge three things upon every cultivator of plants; these are, observation, reflection and action—indispensable at all times, but at no season more so than at present. Premising that the plants have been carefully potted in suitable soils, the next point is situation, the temperature of which should be in proportion to that of the localities to which the plants are indigenous. Theory points out the advantage of a moderate bottom heat, as the earth is invariably some degrees warmer than the atmosphere; practice proves this, and proves also that an excess of heat is as injurious to the roots as to the tops. Ample space for every plant is indispensable, and it is impossible, if the plants are at all crowded, to make handsome specimens of them, however well they may be attended to in other respects. After securing the largest possible amount of light, as much heat and moisture may be supplied as the plants will bear without producing weak or spindling growths; taking this as the criterion, any individual plant which seems to require a warmer, or cooler, a moister, or drier situation, should be accommodated accordingly. Plants of a shrubby habit will require, besides the general direction of the shoots, the occasional stopping of any young growths which are unduly taking the lead; and climbers on trellises will require daily attention, to prevent their twining about the wires, and reaching the top of the trellis before the bottom is properly furnished. On the other hand it is not a good plan to keep the tender young growths tied in to their extreme points, as the practice has the effect of crippling them and preventing their progress; and the plants, especially of delicate species, soon acquire a stunted appearance. We prefer allowing the shoots of strong growing kinds to keep from 12 to 18 inches in advance of the tied-in portion, taking care, however, to prevent entanglement. Mealy bug, scale, and other insects which torment stove plants, increase with frightful rapidity at this season, and it is necessary to make great exertions to keep them even in check. Great care is necessary in watering newly potted plants to prevent the fresh soil from becoming soddened and soured. When any plant is observed to be in this state, it should be shaken out, repotted in sweet soil, and more carefully watered for the future. But if this operation is to be of any service, it must be performed without delay, as the roots of plants are speedily injured and destroyed if allowed to remain in contact with unwholesome soil. Thunbergias, Clitorias, and other climbing tender annuals, should be transferred at once from 4-inch pots to those in which they are intended to flower, in order that they may at once be furnished with a suitable trellis; the soil for Thunbergias can scarcely be too rich. Ipomœas of the annual kinds should occasionally be stopped, to induce the formation of laterals, and to equalise the strength of the plants. Abundance of light is necessary, to prevent weak long-jointed shoots, and when their growth is nearly completed, and the plants begin to produce flower-buds, the amount of air should be considerably increased, in order to prepare them for the cooler atmosphere of the conservatory. Ipomœa Learii and I. ficifolia are excellently adapted for the autumn decoration of the conservatory; for this purpose they should be potted in 10 or 12 inch pots, grown in stove heat till the end of May, and then removed to cooler quarters. The plants will flower more freely if they are kept in their pots than they will if planted in the soil; but there is an advantage in setting the pots on the surface of the soil, and allowing the plants to root through, as they are thereby enabled to guard themselves against accidental drought, and the nutriment they derive by the same means contributes to maintain a healthy appearance to a later period without interfering with the profusion of their blooms.

FORCING DEPARTMENT.

Vineries.—In the earlier houses, use the utmost diligence to keep down insects, especially the red spider; this attention will be particularly required in houses where the ripening of fruit renders it necessary to maintain a drier atmosphere. Where proper care has been taken to keep the enemy in check, little difficulty will be experienced; but if this is or has been neglected, the gardener will stand a chance of seeing the leaves ripen as soon as the fruit, and, of course, he must expect only a limited quantity of elaborated sap for the benifit of the future crop. Applying a wash of sulphur to the hot water pipes or to the surface of the flues, is the easiest and quickest method of destroying these insects. Melons.—In determining the number of fruit to be matured on each plant, exercise as much caution as you would in regulating a crop of Grapes; the proper medium of size, and perfection of flavour, depend on the plants being neither overstimulated nor over-cropped; the latter fault should be carefully avoided, as by it, not only are the fruits of the first crop inferior, but the chance of a second crop is rendered hopeless. Admit air freely during warm sunshine, and maintain a moist atmosphere by means of evaporating pans, and by sprinkling the paths and soil with water. Strawberries.—Continue to forward successions of this useful fruit, and by fumigating or syringing destroy aphides on the leaves and fruit of those which are in progress; this demands particular attention, as these little pests suck the juices out of the fruit while in its young state, which of course spoils its appearance, and prevents its swelling. With proper attention Strawberries should now be obtained as good as at any season; and every means which will contribute to produce fine well-flavoured fruit should be put in practice. Placing the plants near the glass, where they can have a free circulation of air, but at the same time be guarded against cold currents, is very important. The small weakly berries should be thinned out, leaving from six to ten of the most promising upon each plant. Up to the time when the fruit begins to change colour, manure water may be applied with advantage once a week, but after that it should be entirely withheld, and even clear water should be given more moderately. The flavour of the fruit very much depends upon careful attention to these points.

FLOWER GARDEN AND SHRUBBERIES.

The evergreens which were placed in the flower-beds during the winter should now be removed to the reserve garden, in order that the ground may be prepared for its summer occupants. The beds which have been filled with Crocuses, or other winter and spring flowering bulbs, are generally prepared for this purpose by taking up the bulbs about this time; such a practice, however, is very objectionable, on account of the foliage not being sufficiently ripened; and even if the bulbs are left in the ground until properly matured, and then taken up, the flowers are not nearly so fine or so strong as when left undisturbed. Every objection may be removed, and much unnecessary labour prevented, by laying a few inches of fresh soil on the beds for the summer flowers, without disturbing the bulbs. When this operation is being performed, the leaves of the Crocuses should be tied together in knots, that they may have time to mature themselves, without interfering with their successors. In removing the latter in autumn, they should be drawn out of the ground, in order to prevent injury to the bulbs beneath; at the same time, a portion of the spring top-dressing should be removed, sufficient to leave about 2 or 3 inches from the surface. By this method, gorgeous masses of flowers are displayed, both summer and winter, without the plants of one season interfering with those of another.

KITCHEN GARDEN.

Those who have sown their Leeks in a frame (according to former directions), with the intention of transplanting, should now get the ground ready for them. To produce this excellent vegetable in perfection, it should be grown as large and as quickly as possible, as the flavour is thereby rendered much milder. As the Leek is fond of moisture, its roots have a natural tendency downwards, deriving their nourishment principally from below the reach of the scorching sun of summer. The ground for this crop should be dug 18 or 20 inches deep, and the manure laid into the bottom of the trench, which should be previously loosened up with a fork. Of the planting we will speak in a future number. After this time it is better to sow Lettuce where it is to remain. The drills should be drawn 10 or 12 inches apart, and a few seeds dropped in at intervals of 8 inches; these patches, as soon as they are fairly up, should be thinned to one plant. It is better to avoid transplanting Lettuces in summer, as the tap root is liable to get broken in the operation, and the plants have to depend for their support on the surface soil, which for this crop is too much exposed to the drying influence of sun and wind. The plants are thus rendered deficient of that crispness and succulence which is so indispensable in this salad, and are much more liable to run to seed. In hot summers, transplanting will only succeed in such ground as that of a London market gardener, where the soil is very rich and moist.

HARDY FRUIT GARDEN.

Wall trees on which the fruit is set, should have their covering of Spruce or Yew branches gradually thinned; particularly where the latter is used, as the leaves continue there much longer than they do upon the Spruce. Commence the disbudding of Peaches and Nectarines by removing the foreright and back buds now; but defer the final arrangement for 10 days or a fortnight longer. After the blossoms are fairly set, advantage should be taken of a fine morning to wash the trees with the engine, for the double purpose of removing decayed blossoms, and destroying the green fly. Be careful not to get the trees too thick of wood; but if they are plentifully furnished with blossoms, thin out some of last year's shoots, wherever there is a superabundance of them; taking care to remove side shoots only, and in cutting them, to leave the lowest bud on each to produce a new shoot. In this manner, young wood may be obtained in parts of the tree which would be otherwise barren. Let particular attention be paid to hand-picking, and destroying caterpillars.

State of the Weather near London, for the week ending April 21, 1851, as observed at the Horticultural Garden, Chiswick.

| April. | Month & Age. | Barometer. | | Temperature. Of the Air. | | | Of the Earth | | Wind | Rain. |

The highest temperature during the above period occurred on the 28th, 1841—therm. 81 deg.; and the lowest on the 27th, 1835, 29th, 1836, 28th, 1846, and 1848—therm 27 deg.

## Notices to Correspondents.

Asphalte: *E Y L.* We object to this, because of the bad taste and smell it communicates to water long after it is applied. Gutta percha is much cheaper than lead; but we cannot say their relative price. You will learn by applying to any one of the thousand dealers in the former. We have no objection to it.

Aquatics: *P W A.* Water Lilies do not produce scum upon ponds. It is produced by the presence of minute Confervæ, and can only be cured by putting the water in rapid motion, or by keeping ducks and such birds to eat it.

Bees: *Anna.* The last named hive by all means, and that sold by Milton is the best we have seen. The others are toys, very costly, and they rarely answer. *Y.—P T O.* If the hive is a wooden one, take out all the old comb, and it may be used again; but if it is a straw one, it is better to put it aside and use a new one. *Y.*

Books: *J H S.* Dr. Lindley's "School Botany"‡

Cinerarias: *Oxon.* The colour you name is by no means a scarce one among Cinerarias. We have them now of all shades of blue.

Clematis: *Anon.* What is C. odoratissima? If by that name you mean Cl. montana, then we presume that its roots are too much confined; it is a very rank grower, and wants a great deal of food at the root.

Fancy Dahlias: *E H.* You will find a list of the best of these at p. 72 of the current year's volume.‡

Gardeners out of Place: *G Kelly.* It is unreasonable of you to expect such letters to be answered. The absence of a reply is in fact an answer—in the negative. You can have little knowledge of the world not to know that time in England is too precious to waste in needless letter writing. As to putting a penny stamp in your letter, that is wholly unnecessary: nobody expects you to do so.

Horse Chesnuts: *J N V.* The deformities are caused by the young branches having been injured last year on one side; probably about midsummer. In attempting to repair the injury by rapid growth, the wounded side has lengthened more than the sound side, and hence the curves. What may have produced the injury we have no means of judging. Has any one been firing shot among the branches?

Insects: *J N C.* The insects in your Cucumber frame are a very minute species of mite (Acarus), which have, most probably, been reared in the vegetable manure. It would be well to take up the plants, and saturate the earth well with boiling water; and each plant might then be very closely covered with a small frame, and well fumigated. *W.—H W.* The Peas sown are sadly infested with a species of millepedes, or thousand legs (Julus pulchellus). The ground must have been very foul; it would be well to serve it as recommended in the last answer, and then re-sow it with Peas for a later crop. You may also entrap the millepedes in great quantities, by laying slices of Turnip on or under the surface of the ground. *W.—W S.* The minute specks on the under-side of the Camellia leaf may possibly arise from the punctures of some insect (none of which are now visible), but, we apprehend, rather from atmospheric causes. There was no insect in the quill, from the Cucumber frame, one of the corks having got loose; but see the two preceding replies. *W.*

Mistletoe: *P T O.* It will take and grow freely on the Apple or the Thorn. Slit the bark and insert a seed or two here and there, where you wish it to establish itself, which should be on the under side of the branches, or the birds will eat the seeds.‡

Names of Plants: *G W.* Gongora truncata and Oncidium pubes.—*Erzeroum*, 939, Cakile maritima; 934, Setaria italica; 922, Vitex Agnus Castus; 931, Phytolacca decandra; 923, Plantago Psyllium; 918, Siegesbeckia orientalis; 921, Pancratium illyricum; 794, Hypecoum erectum; 902, Xanthium strumarium; 894, Linaria dalmatica; 895, Bidens tripartita; 860, Prunella vulgaris; 843, Serapias lingua; 845, Mespilus germanica; 853, Berberis vulgaris; 839, Erythræa Centaurium; 838, Tilia europæa; 835, Polypodium vulgare; 833, Polytrichum commune; 830, Ruscus Hypoglossum; 831, Aristolochia Clematitis.

Salvias: *Tyro.* It is doubtful whether the blue Salvia would succeed treated in the manner mentioned at p. 246. It might, however, be worth while to try the experiment.‡

Vines: *A Constant Reader.* You state that so long as dung beds were made on the border, the Vines bore well, although the surface was as hard as if concreted; and that since the border was broken up and renewed at top, there has been a great falling off in produce. It is evident from the bunches curling up and proving blind, like the specimen received, that there must be a fault somewhere. It is not in the management of the house, for according to your statement that is proper enough; nor is it in the breaking up and top-dressing of the hardened border, for this process is often beneficial. But your Vines were formerly accustomed to warmth at root from dung-beds—these you have discontinued; and no improvement, in other respects, can possibly make up for the loss of heat. With regard to the shoots not bleeding when you tried to ascertain the flow of sap by cutting after the buds had broken, that is no criterion of their being in bad health, for the expanding leaves generally appropriate all the sap, even when the roots are in full action, which cannot be the case whilst the border is very much colder than the house. This condition, the sole cause of your complaint, you will doubtless remedy in future.‖

Weigela rosea: *Notts.* Cuttings of the young wood inserted in silver sand now, and covered with a bell-glass, will be found to strike root freely.‡

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS,

AS THE

ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by Dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9l. 10s. per ton, or 9l. 5s. in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.

40, Bridge-street, Blackfriars, London.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

MR. J. C. NESBIT, F.C.S., F.G.S., Consulting and Analytical Chemist, Laboratories, 38, Kennington-lane, London.—PRIVATE INSTRUCTIONS in Chemical Analysis, and the most approved methods of making ARTIFICIAL MANURES. Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

GUANO AND OTHER MANURES.—Peruvian Guano of the finest quality; Superphosphate of Lime; Gypsum; Salt; Nitrate of Soda; Moffat's Patent Concentrated City Sewage Manure, and all others of known value.—Apply to MARK FOTHERGILL, 204, Upper Thames-street, London.

MANURE DEPOT.—PEAT CHARCOAL.

TO FARMERS AGRICULTURISTS, AND OTHERS.

G. H. FOLEY, Essex Coal Wharf, Lea-bridge, Middlesex, Agent by appointment to the Irish Amelioration Society, for the sale of the above. All needful particulars will be given on application at the above address.

Price of the unmixed Charcoal, 60s. per ton, sacks included. Mixed with Nightsoil, 45s. per ton, sacks included.

DESICCATED ANIMAL MANURE.—This Manure, which has proved so eminently successful in the culture of both Cereal and Green Crops, can now be had of the Manufacturers, J. M'CALL and Co, 60, Spring Gardens, Manchester; RITCHIE and M'CALL, 137, Hounds-ditch, London; and of all Agents. Price 6l. 10s. per ton, including bags delivered on the rail in Manchester.—Copies of Analysis and Testimonials forwarded post free on application. Agents wanted.

HOSE FOR LIQUID MANURE, Fire-engine, and agricultural purposes, made of canvass, lined and coated with gutta purcha; it is about one-third the price of leather or india-rubber, will convey liquids of all kinds under a heavy pressure, it is extensively used at the Government public works; also by the navy, and amongst agriculturists, giving universal satisfaction. Testimonials and prices may be obtained of Messrs. Burgess and Key, 103, Newgate-street, sole manufacturers.—London Agents: Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.—Country Agents: Messrs. Ransome and Parsons, Ipswich; Messrs. J. and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. S. Wilson, Agent for Scotland.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

THE ANNUAL COUNTRY MEETING of 1851 will be held, by the gracious permission of Her Majesty and Prince Albert, in the HOME PARK, WINDSOR, in the week commencing MONDAY, the 14th of JULY.

Copies of the Prize Sheet, containing the terms, conditions, and amount of the respective Prizes, and the Rules of Exhibition, and also copies of the requisite printed Forms of Certificate, may be obtained on application to the Secretary, 12, Hanover-square, London. All Certificates must be returned, filled up, to the Secretary, on or before the **17th of May**, the Council having decided that in no case whatever shall any Certificate be received after that date.

In the application for Certificates, the Character and Age of the Animals to be exhibited should be stated, in order that the proper Forms of Certificate may be sent.

By order of the Council,

JAMES HUDSON, Secretary.

12, Hanover-square, London, April 26.

# The Agricultural Gazette.

*SATURDAY, APRIL* 26, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

THURSDAY, May 1—Agricultural Imp. Soc. of Ireland.
WEDNESDAY, — 7—Agricultural Society of England.
THURSDAY, — 8—Agricultural Imp. Soc. of Ireland.

THERE can be no person, whether actually engaged in any profession or merely proposing to join it, but must acknowledge the need of some education, in order to its successful prosecution. This may safely be said, notwithstanding the outcry which is being raised by many against the cultivators of the soil in connection with this subject. We are persuaded that there is not a tenant farmer in the country but will insist as heartily as any agricultural chemist of the day on the necessity of AGRICULTURAL EDUCATION. The difference between the two relates not to the need, but to the nature of the education required. In our own country, the Royal Agricultural College at Cirencester has by no means prospered as it has deserved; and, in the State of New York, Professor JOHNSTON tells us* the establishment of an agricultural college, at the expense of the State, receives its strongest opposition from among the farmers of the National Assembly; but in neither ought the feeling thus indicated to be regarded as altogether hostile to the cause of agricultural education. Professor JOHNSTON seems to attribute it to a personal feeling of pride or jealousy on the part of the agricultural body. "To provide more instruction for my son in the business I myself follow is to acknowledge my own want of information;" and this, he says, is a degree of humility which the mass of the people cannot bring themselves to exhibit. We hardly think that the indifference of the agricultural body to those facts in chemistry and other sciences which bear upon their own professional practice, is to be attributed to anything so paltry and childish as this. It is rather due to the lessons which, whether accurately or not, they have gathered out of long experience as to the real source of profit in farming. And there is, as we believe, so much truth on both sides of the controversy between farmers and philosophers relating to this subject, that, if it were to be treated controversially, we believe either side of the dispute might be safely espoused: so that while addressing farmers on the subject, who already hold whatever is true on their side of the question firmly enough, one might be content to insist almost exclusively on the advantages of a scientific education for the agricultural apprentice; on the other hand, in addressing the Professors of an Agricultural College, who are already far more sensitive on the subject of these advantages than ourselves, we should be inclined to follow the example of their opponents, and insist, almost exclusively, on the necessity for an education of the body as well as of the mind. We have however, to treat the matter not controversially but positively, and the whole truth, therefore, needs to be stated. And so the advantages not only of the skill to be acquired by habit and practice in the field, but of the abstract truths which may be learned in the class-room, have to be insisted on.

We must, however, be satisfied to accomplish one half of our task at a time; and if for the present we join the practical farmer in an address to the teachers and professors of our agricultural colleges and schools, we shall probably give expression to his feelings on agricultural education, or at least to so much of them as we ourselves concur in, somewhat as follows: "Money making is a distinct art and profession, not necessarily incompatible with farming, nor indeed with any other of the numerous occupations in which our neighbours are succeeding or failing around us—but distinct from them, depending for its success on rules and habits of its own. We do not say that the annual balance-sheet, whether of a farmer or a manufacturer, is dependent wholly on his knowledge of this art; it is, no doubt, dependent on the plan and details of his year's proceedings; its losses may have arisen from a plan of operations opposed to natural laws, of which he was ignorant, or from faulty details, by which he has been involved in a wasteful expenditure—we do not say that a knowledge of natural laws, as they are arranged under the different sciences, might not have increased his gains; nor that a little acquaintance with the ordinary practice of his profession might not have diminished his losses—but we do say, that men with the widest general knowledge, and the most accurate acquaintance with farm practice, may nevertheless fail of attaining the chief end of farming; and we do say, that the most accomplished student ever sent out by an agricultural college has yet to learn what professors cannot teach him before he can be sure of realising that test of agricultural perfection—farm profit. This is a point on which students should be informed. You can, we will admit, teach them both the right plan and the correct details of an agricultural year—but they must also be taught that the annual result may be bad, notwithstanding a plan and details, and even good in spite of them, according to the *business habits* which they bring to bear on their superintendence: for farm profits depend upon the personal supervision by the master of every minute and penny spent, far more than upon anything else. And skill in marketing, and patient industry in the daily superintendence of the details of an annual routine, cannot be communicated at agricultural colleges."

This expresses, we believe, pretty nearly the feeling of the practical farmer; and there is nothing stated in which we do not fully agree with him: the error consists not in the opinions themselves, but in the idea that they are either opposed to, or opposed by, the advocates of a scientific agricultural education. Their reply must be reserved for another occasion.

* Notes on North American Agriculture, Economical and Social. By J. F. W. JOHNSTON, M.A., &c. Wm. BLACKWOOD, and SON, Edinburgh and London.

## ON THE INTERLINING OF CROPS.

BISHOP OF ELY.—"The Strawberry grows underneath the Nettle and wholesome berries thrive and ripen best neighboured by fruit of baser quality."—*Henry 5th.*

LIEBIG says, "It is evident that two plants growing beside each other will mutually injure one another, if they withdraw the same food from the soil;" and he adds, "Plants will, on the contrary, thrive beside each other, either when the substances necessary for their growth, which they extract from the soil, are of different kinds, or when they themselves are not both in the same stages of development at the same time."

The interlining of Beans with Cabbages or Turnips has been practised for a long time with success in the island of Jersey and in England by the Earl of Lovelace, Mr. Hewitt Davis, and Lord St. John of Melchbourne, and it is also a common practice to interline in our gardens. But this is so done, not always on the conditions that Liebig supposes requisite for the full perfection of their growth. In the island of Jersey, and in our gardens, two crops are grown together, and at the same time; and this is also the practice of Lord Lovelace, but they appear rather to have been so grown as being the intermixture of a tall and a low growing plant, than of having been adopted as possessing the conditions of extracting from the soil different kinds of substances. Mr. Hewitt Davis and Lord St. John seem to have adopted the intermixture upon the same principle of tall and low-growing plants; but these, I must think fortuitously, under the second condition of Liebig, of both not being in the same stages of development at the same time; they come indeed rather under our denomination of stolen crops, and perfect their growth, and occupy the ground after the removal of the plant of prior development. Had a scientific view been entertained by these intermixtures, there does not appear to me any reason why two low-growing or two tall-growing crops should not have been interlined on the first condition of Liebig, that of drawing different elementary matters from the soil. I do not wish to say that the plants so grown do not use up different kinds of, or various proportions of the same elementary matters, for possibly no two plants of different families draw the same matters from the soil. I am, I believe, drawn into a false term; I should say use up or assimilate, for it is highly probable that plants have no power of choosing what they shall draw from the soil; they must receive what the water they do draw up by their roots contains in solution, be it nutritious or injurious. We know if poisons are so offered to them they cannot refuse them; they, however, possess the power of separating the nutritious from other matters which they so receive, and which I should think is purely a chemical affinity, derived from the parent plant, and first implanted in it by Him who willed its being.

It is under the two conditions stated by Liebig that I propose to submit to the consideration of the readers of the *Agricultural Gazette* the subject of interlining crops of the most distinct families; that is, those the advocates of an alternate husbandry consider, in the practice they recommend, as such, and which opinion is borne out by their chemical analyses. I mean those of our Cereal and culmiferous families, and I do hope that in instituting the inquiry it will be taken up by some one better qualified to discuss the subject.

The successful interlining system must depend on those two conditions of Liebig, and upon the same principle on which is founded our rotary system as regards the first condition, the power of assimilating either different elementary food, or different proportions of the same food; the same condition, indeed, holds (and there is then in truth but one condition in two parts) with plants not in the same stages of development at the same time; for it has been found that the same plant, at different stages of its growth, does assimilate various proportions of elementary matter.

It cannot be questioned that those matters a plant does not appropriate must be returned either to the air through its leaves, or to the soil through its roots, we cannot attribute either to the leaves or to the roots a discriminating power of choice; if they are returned by the roots, agreeable to the experiments of Macaire, they may be retained in the soil for future crops, and thus become available in our alternate husbandry; if, on the contrary, the leaves discharge them into the air, they are, except in so far as they may fall to the earth and be absorbed by the soil, lost to the future crops under the alternate system; but they become immediately available in the interlining system, for there are plants sufficiently near to lay hold of them and appropriate them.

It is admitted that there are certain matters that the plants get rid of through their leaves; the interlining has then this advantage over the alternate one of giving to its vegetation the matters thrown off into the air, and it enjoys equally with the alternate husbandry the advantages it derives from the change of crop in its vegetation, taking up those matters which, according to Macaire, are discharged by the roots; for the interlining system is also an alternate system.

I think the experiments of Macaire require confirmation. I do not see that the roots of plants are supplied with excretory organs, but we know that the leaves are; we know that they thus get rid of certain gases; we know that they thus part with the water of perspiration, and we have no reason to doubt that they may also so discharge even such inorganic matters as do not enter into their system. Liebig says that fluids in a state of evaporation carry with them bodies which are not of themselves capable of volatilisation; his words are—"A liquid during evaporation communicates the power

of assuming the same state in a greater or less degree to all substances dissolved in it, although they do not of themselves possess that property." And it has been adduced as a proof of the circulation of the sap that they do so get rid of the colouring matters they have been artificially made to imbibe by their roots. It is stated that the coloured ascending fluid has been observed to the leaves, that it has there lost its colour and been seen to descend from the leaves colourless or as a milky fluid. Poisons appear also to be discharged by the leaves.

My experiments have tended to confirm the views I submitted in the *Agricultural Gazette* of 1844, on this subject; I can alone attribute the greater products under peculiar circumstances of certain garden experimental crops to their receiving a greater supply of nutriment from the air through their leaves, this nutriment having its origin in the soil, the air being the medium through which it is conveyed to the leaves; and its escape from the earth, as well as its composition in the earth, being facilitated by the stirring of the soil about the plants. Although the opinion of the roots having the power to refuse matters that do not enter into the composition of plants has been exploded; yet if we admit the immediate action of leaves on the matters offered to them, we cannot, I think, deny them a power of discrimination and of choice in what they imbibe.

But whether they have this discriminating choice, or whether they must take in all that is offered to them, and then throw off those matters which the plants do not assimilate, the matters so discharged or so refused will be found floating in the atmosphere surrounding them, disengaged and ready to be taken up by any contiguous plants of different elementary constitutions.

By these considerations, by observation, by the success that has attended the interlining of green crops of others, and by small experiments of my own, I have sufficiently satisfied myself of the probable profitable return from the interlining of cereals and vegetables, if in the practice insuperable difficulties do not occur; and I have therefore this year placed under this cultivation nearly five acres of land. My expectations are that I shall derive one-half more return than had each crop been grown separately; at the same time, however, more labour will be expended. The crops interlined are Cabbages and Wheat.

In a future paper I propose to give a detailed account of my operations and of the expenditure on them, and also those attending a wide-rowed tillage of Oats, extending, I expect, to about eight acres. In this, in answer to a question put by "J. H.," I will say I do not use one-half the quantity of seed Oats usually sown broad-cast in this country. *J. M. Goodiff, Granard, March 25.*

## THE COTTAGE OF THE AGRICULTURAL LABOURER.

The slow and gradual upward progress of the social system renders it very probable, if not absolutely certain, that any considerable amelioration of the lowest class of society must apply to a generation yet unborn, and consequently the comfort and social happiness of the present existing race must chiefly depend on the humanity and kindness of their employers, whether strictly immediate, or not. It is most proper and just, that wealth be used in providing for the maintenance and comfort of the labour by which it is produced; and surely no employment of it can be so pleasing to humanity, or more agreeable to the feelings of a just benevolence.

The social system of the agricultural employment renders it more variable, and consequently less comfortable than other sources of labour. The occupier of a farm, even under a lease, has only a present interest in the holding, and he pays no attention to permanent objects, further than they serve his temporary interests. The buildings on the farm are only used to serve a certain purpose, which is often far removed from any idea of comfort to the inmates, and it is certainly not his province to produce objects that would remain for the benefit of others, after his removal from the occupation. He gets no yearly income from the hovel of the labourer, nor from any expenditure he may make upon it, and therefore it occupies neither time nor attention from him. And no blame can be attached to the farmer, the system is in fault, which leaves permanent objects to be cared for, by a temporary interest, and gratifies a sordid purpose at the expense of justice and humanity. This neglect on the part of the landowners, has been very instrumental in producing the wretched hovels or sheds in which the agricultural labourers are lodged, and which form a blot of no small magnitude on the farm practice of some of the farming districts of Northumberland, and the South of Scotland, where the genius of agriculture may be truly said to have fixed its chosen residence. Here the land of the very best quality, the most complete Turnip farming, the highest rents, and the richest and most enterprising tenantry in Britain, exhibit the most wretched specimens in the kingdom, of the accommodation that is given to the labourer, who is the moving power, the sinew and strength of every active operation. The houses are of one apartment, about 20 feet by 16 feet in size, where a family is huddled together, as in a pinfold, without any comfort of separation, or the means of preserving the common decencies of life. Immorality becomes a part of the system, and is thus engendered and fostered from the very first entrance into life. The house of one apartment is nothing better than the stall of a stable, where the animal eats and sleeps in the same enclosure. Rational creatures are in this way nothing removed beyond the beasts that perish; they labour and exhaust their power, and derive the rewards of toil in one respect on an equality with the dumb brutes.

It is the bounden duty of the landowner to provide the proper accommodation of the labourer, as it forms a part of the permanent furniture of the farm, for the use of which the occupier pays a stipulated yearly rent. And as the landowner has both the means and the power of making the proper and necessary arrangements that are consistent with humanity and congenial with benevolence, remarks on this subject may be applied to their own individual sense of social propriety. Bad accommodation forms a very large part of the illiberal treatment which alienates the affections of the lower orders, begets carelessness, and produces the evil feelings of dislike and revenge. The contentment that is produced by the comfort and convenience of a dwelling, goes a long way in removing other irksome circumstances of labour. The garden affords occupation and amusement, and a food in vegetables, which is of all others the most innocent and agreeable to the animal functions. A neat, clean cottage, which is provided with the requisites to yield that appearance, forms a very pleasing attraction to the weariness of toil, and confirms the natural attachment to family and home. Such an appearance begets the idea of being somewhat raised in the scale of society, which exerts a very powerful and lasting effect in producing the habits and feelings of independence, in raising the notions of respectability, and in assuming and sustaining the form of character which is equally useful in the fear of its instability and in the dread of its loss. This comfort of the dwelling, along with the healthy employment and beneficial produce of the garden, will banish the depression of spirits that attends the sight of misery and the want of comfort after the toil of the day is over, and will employ the vacant mind apart from the sources of wickedness and the haunts of dissipation. Those pests of society, in the form of ale-houses and beer-shops, are supported by the want of just attraction being afforded in the proper place, where the attention may be fixed and the occupation riveted.

The first step towards the comfort of civilisation is the decent separation of age and sex, or the providing of separate apartments. And the first step in making this division consists in separating the sitting and sleeping apartments, or in having apartments for both purposes; and it is most agreeable with convenience and comfort that the sleeping apartments be removed from the ground floor, and that they are most airy, dry, and comfortable, in the second story of a building. The business of cooking creates a disagreeableness to the persons who are not employed in the operations, and is incompatible with the cleanliness that is essential to the comforts of life. A bed in the sitting apartments always emits a stale odour, that is both offensive and unhealthy, and creates much additional labour in the frequent alterations of the furniture, and the sweepings of the apartment. One single apartment for the whole family is utterly incompatible with the maintenance of the decencies of life, than which nothing more strongly contributes to the prevention of immorality, and the consequent commission of crime. One apartment for general purposes demands another room, for the purpose of some little degree of retirement.

Another most essential requisite to the comfort of any human dwelling, is the having some back apartments where the scullery-work is performed, and where the utensils are kept from view. No part of provision is more necessary than this back accommodation, without which the kitchen or common apartment will be always dirty and encumbered. And these apartments must be in number sufficient to yield the amount of accommodation that is required, or the purpose will be left undone, and the object will not be promoted.

It must be conceded to be a very beneficial arrangement by which the keep or use of a cow in milk forms an item in the wages of the labourer. No substance in common use can be compared with milk for the rearing of a family of children; and, where it is not required in the original form, the use of it in butter and cheese is always available. But in order not to raise a large village of back buildings attached to the cottages, we think it is preferable that the labourers' cows be housed at the farmery, and have the common food of the farm. And in case of the agreement being for the use of a cow, it may be inferred that when one animal goes dry, another giving milk will be afforded, which will continue the supply of the article to the labourers without interruption. The keeping of a pig is most absolutely necessary to every labourer; and when a quantity of Potato-ground in the farmer's field forms a part of the wages by valuation, the refuse of the produce, joined with the garden stuffs, may be arranged to bring forward two pigs yearly, and will require some Beans and Barley-meal to finish the process of fattening. This article is of a vast advantage to a family, and should never be neglected. The late William Cobbett very pithily observed, that some flitches of bacon being prepared for the winter's use, prevents stealing and poaching much more effectually than whole volumes of penal statutes. It is socialism of the right sort; it softens the temper, restrains the desires, and promotes the domestic harmony. A sty for the pig is a provision of the first importance in arranging the back premises. Poultry can also be kept in a small number, and one apartment will accommodate both ducks and fowls.

Poultry require much warmth, and when duly provided to them, eggs and young chickens can be got almost throughout the whole year. In this case, the poultry-house is placed in the centre of the cottage and between the fire-places, in order to enjoy the warmth that will arise from the fires. The door opens from the back area, and the house may be used for poultry only, and be fitted for hatching and laying eggs. The fuel, either wood or coals, must be under a roof and within a lock and key, and requires a small apartment. The process of washing the clothes of the family and the necessary utensils require a wash-house of tolerable dimensions, where all dirty work will be performed. The ashes must be carefully preserved for manure, and require a house for that purpose.

We hold that a piece of garden ground for the purpose of raising some fruits and vegetables, is not only useful, but indeed necessary, to every rural occupancy. Without it, the country is changed into a solitude, and the enjoyments of it are shut against the very persons who are the chief instruments in producing its pleasures. The average extent of a labourer's garden may be fixed at one-sixth part of an acre. This small expense falls on the landlord, and, certainly, no outlay can be better expended. The front of the cottage may range from east to west, in the front of the garden, and at a small distance from a road. The position should be dry, and the situation airy; but as these advantages cannot be got at pleasure, it is proposed to place the entire area of the cottage building on a terrace, or to raise the interior of the cottage above the outside level, and to ascend by steps. It is essential that a dry foundation be obtained, and the floors may be raised by a mass of broken stones to the height of the flooring, from the depth of the excavation. It has been frequently recommended as an absolute rule, that the diagonal line of all cottages run north and south, in order that the sun may shine on every side of the house, between the rising and setting, for the purpose of promoting warmth and evaporation. Such an advantage is certainly very desirable; but circumstances will very much impede its general adoption. It will be most convenient when the front of the cottage runs parallel with the road, unless the point of exposure should be insurmountably objectionable. A few trees round the cottage, or a clump on the most exposed side, will be very ornamental.

A porch is a very useful appendage to a cottage dwelling, as it breaks the dull uniformity of a bare wall, and it shelters the door from stormy quarters, and also affords some little inside room. If possible, the garden should surround the cottage; but if the situation prevent that object, it should at least be close to the house. An isolated garden is not so attractive, and is never so well managed, as when it surrounds or closely adjoins the cottage. A spring of water may be found or sought near to the cottage, and may be brought to it in a rill, or in a pipe; if not, a well must be sunk, and a pump erected, and then two cottages may be joined together, and the well can supply both habitations, by distribution, in the back yard. The provision of water is the most indispensable of all requisites to human life.

Every cottage should contain two apartments on the ground floor, and three bed-rooms in the second story, which may be wholly in the side walls, or half in the roof. It will be advantageous that there be fixed in each bed-room a bed of four posts with boarded bottom, and remain as the furniture of the cottage, which will very much assist the labourer, and add very little to the original cost of the building. The back premises are a pig-sty, fuel-house, wash-house, house for ashes, poultry-house, and privy. They are built as lean-to's, on the posterior wall of 10 feet in height, and slope to 6 feet in front. The water from the roof of all the houses is collected into a tank, from which it is used to assist the drainage of the house.

The cottage must have a door in front and behind to promote ventilation, and secure cleanliness: the doors must not be placed directly opposite each other, so as to cause a straight current of wind.

Two cottages are very economically joined together sideways. Squares, circles, and polygons, have been devised to contain a number of dwellings—but such congregations are most generally productive of rudeness and immorality, and are destructive of the simplicity which flows from a rural education. Much idle gossiping is occasioned, and tale-telling gives rise to perpetual heats and strifes; except on very large farms, more than two cottages joined together is not eligible.

Such an important subject as the comfort of the labouring population, which is the source and support of every kind of wealth and prosperity, cannot be let go without an earnest recommendation that the cottages be made the proprietors' concern, and not left to the mercenary care of gain in the charge of the temporary occupier of the land.

No furniture or landed property can be more valuable to the possession of it, or add more to the beauty of the landscape, or afford a greater degree of satisfaction to a benevolent mind, than a number of comfortable and economical cottagers' dwellings erected in the required positions, and inhabited by families of health and prosperity, warmed with gratitude and chained by affection to the soil of their birth. And these chains are by no means of difficult fabrication, nor are the materials costly, or the workmanship laborious. An adequate provision and comfort to enjoy the use of it constitute the whole sum of the amount—the latter item giving a relish which a greater quantity of the former would not impart. The father of children looks more to their comfort than he regards his own, and he feels more for his wife's labour and inconvenience in the awkwardness of the dwelling,

than he does for his own daily toil. The pleasures of a neat home naturally console him for the labours of a dreary day, and the joys of a cheerful fireside commit the cares and toils of life to a drowsy forgetfulness. On the other hand, the sight of misery, after a hard day's toil, depresses the spirits, and impresses the idea, that do what he will, the labourer must be comfortless, and too often drives him to the beer-shop, where the artificial exhilaration leaves only a greater despondency. But when he sees the intention of making him comfortable evinced in the erection of a convenient dwelling, he will immediately add to it his own industry, as far as he is able, and will avail himself of the means that are offered of making himself more respectable by his own exertions. The beginning has only to be made: and if our observations shall in any way lead to the very desirable consummation, the labour will be cheerfully rendered. *J. D.*

## ON THE TULLIAN SYSTEM OF CULTIVATION.

No. II.—Satisfactorily assured, from repeated experiments, that the grain crop in rows, at sufficient distances to admit of working the ground through the whole period of its growth, will be more productive than if sown in any other way;—convinced that it is as capable of becoming a fallow crop as any green crop, and that it will be found as superior to the broadcast crop as the Turnip has been proved to be; and decidedly of opinion that an increased fertility of the soil will be a certain consequence of a continuous fallowing,—I was right well pleased to find the able pen of Mr. Rawstorne again employed in recommending the practice of Tull. He will, I feel assured, be pleased to find that he does not stand alone, although sustained by one so little worthy of being his comrade, and that an old soldier in the cause is again in the field; and not on the broad sheet alone, but on the still broader bosom of our mother earth, and on a scale, though humble, yet sufficient to prove the principle. As pertinent to my purpose, and as his observations may have escaped from the memory of the older, and may not have been seen by the later readers of the *Agricultural Gazette*, I will take leave to give two extracts from a notice of this system by Mr. Rawstorne, in the *Agricultural Gazette* of the 10th of March, 1849; he says, referring to the "New Husbandry:"

"Mr. Evelyn tells us that, take of the most barren earth you can find, pulverise it well, and expose it abroad for a year, incessantly agitated (that is, stirred often), it will become so fertile as to receive an exotic plant from the furthest Indies, and to cause all vegetables to prosper in the most exalted degree, and to bear their fruit as kindly with us as in their natural climates." And he asks, "What effect did Mr. Tull produce by this stirring of the land? Merely this, that he grew on the same land in succession, for 12 years, excellent crops of Wheat, without an atom of manure."

Listen to this, ye farmers of limited capitals, and learn how to meet a fallen market and drive the foreign corn-grower from our coasts. But you will not credit it; you will not believe chemists that, in admitting the atmospheric air to your soils, and which can only be done by keeping them open to receive it, the organic matters floating in the atmosphere enter it, and are laid hold of by the clayey particles of the soil, and retained by them until, by superior attraction, or by some other more powerful property of vegetable life, they are deprived of it by your growing plants, while this same admission of air at the same time disengages and renders soluble the inorganic matters which have been shut up in bonds of iron since the creation, that the whole act together to supply your crops with the elements of their formation. You may not credit the chemist, but you must have confidence in your own practice; you know that in diligently fallowing, by repeatedly stirring for twelve months, a clay soil, you render it capable of doing what it would not have done before, of producing a good crop of Wheat. This has been done to get rid of weeds, no doubt a necessary object, and it has long been thought that this was the only object it accomplished; and I have known some of our older writers express astonishment that such fertility should be caused by turning such minute vegetable matters into the ground. We now know better, and ascribe not the fertility to the weeds, but to a never failing and abundant source of fertility, the atmospheric air, with what it holds suspended in it. If then, by allowing a free inflow of atmospheric air for one twelve months, we induce a fertility that gives us a crop where we would not else have had it, why should not the same means employed a second year give us a second crop, and so on in succeeding years, till we had exhausted the whole of the inorganic matters of the soil within reach of our spades or ploughs; and Liebig says, thousands of years have been required to break down the soil, and thousands of years will be required to exhaust its alkalies. And he adds, "A single cubic foot of felspar is sufficient to supply a wood, covering a surface of 26,910 square feet, with the potash required for five years." But can they ever be exhausted? they must continue to exist in the earth, in the air, or in the water, for they cannot be annihilated. According to Liebig, those that have become soluble will be exhausted by injudicious cropping, and the land rendered sterile; but by a year's fallowing, that is, the land placed in a favourable position, by continual exposure to the atmosphere, to be acted upon by its air with the matters it contains, it has its crude alkalies rendered soluble and gives them up in sufficient quantities for a crop: he says, "The fallow time, as we have already shown, is that period of culture during which land is exposed to a progressive disintegration by means of the influence of the atmosphere, for the purpose of rendering a certain quantity of alkalies capable of being appropriated by plants."

We can attribute the neglect of fallowing, which Mr. Rawstorne complains of, to nothing but the want of a due appreciation of its effects, and to an ignorance of its manner of operation; in pressing on the agricultural world then the importance of a continual fallow, I must endeavour to show its *modus operandi*, although I am aware in doing so that many of the readers of this Paper are better acquainted with the subject than I am, but they may pass it over. I write for those who are not.

Whatever may be the age of this world we inhabit, it is unquestionable that before the time of the creation of the present races the earth had taken on much of its present appearance, that the fertile lands had been formed by the gradual mouldering down of rocks. We cannot doubt this, for we see the same operations of Nature going on before our eyes every day; naked rocks rise from their ocean bed, naked as the new-born babe, hard, and apparently impenetrable, but by the varying actions of the air, of the rain, of heat and of cold, their indurated surfaces soften, scale off, and moulder down; washed by the falling rain and their own gravity, they sink into the hollows, and vegetation commences; by the same actions continuing on the fresh exposed surfaces, in conjunction with, and aided by, the decaying vegetables, the quantity and depth of soil in these hollows is increased; the lofty trees now tower in their height, and the bare and naked rock has become an isle of beauty fit for the residence of man. The same effects of the same causes are to be seen in the crumbling ruins of a feudal age. Time walks triumphant, with his all-subduing agencies, over the finest forms of sculptured art; their fair proportions still remain, but they are all that do remain, their sharp outlines are all rounded off, their whole form deeply corroded, roughed, and pitted by those atmospheric influences which Heaven has given to man, that by his labour he may enable them to operate in that soil which is to give him his daily bread. Yielding to such all-powerful agencies, rocks and stones split asunder, surface after surface scale off and give up the substances, the alkalies, the oxides, they held imprisoned "as fast bound in iron," that are required for the support and very being of vegetable life. That these substances are so necessary is justly inferred by their being found in all vegetables, in the parts of them that are not volatilised by the action of fire; that is, they are found in their ashes.

This slow process of Nature formed, then, our arable lands, as in the words of the celebrated Liebig, "Thousands of years have been necessary to convert stones and rocks into the soil of arable land, and thousands of years more will be requisite for their perfect reduction; that is, for the complete exhaustion of their alkalies." This natural process the farmers of Ireland, of Italy, and of other countries, avail themselves of, though in utter ignorance of its laws, to restore fertility to their soils by leaving them for some years in unworked fallow, or, as it is significantly called in Ireland, "waste." "The fallow time," adds the same authority (I again quote the passage, for it is one to be recalled), "is that period of culture during which the land is exposed to a progressive disintegration, by means of the influence of the atmosphere, for the purpose of rendering a certain quantity of alkalies capable of being appropriated by plants. Now it is evident that the careful tilling of fallow land must increase and accelerate this disintegration."

A very powerful agent in this disintegration appears to be carbonic acid. "The interesting experiments of Struve," observes the same great Liebig, "have proved that water impregnated with carbonic acid decomposes rocks which contain alkalies, and then dissolves a part of the alkaline carbonates." Now as the substances which constitute the principal mass of every vegetable are compounds of carbon, it follows that carbon makes up a very large part of the matters we give to the soil as manures, and it is evident, that by fitting the soil to receive the carbon of the air, we may diminish the mass we give to the soil in the form of manure.

But the beneficial effects of working a fallow are not limited to inorganic nature, they extend to the decaying animal and vegetable matters we have deposited in the soil, as manures, to increase its productiveness; by exposing these matters to the same natural actions to which the alkalies of the soil are thus submitted, they are thus more minutely divided, and more intimately brought into contact with these alkalies. Various compounds are thus rapidly formed in a fit state to be taken up by plants, and an immense and incalculable fertility is induced in the soil.

We know that these atmospheric influences are necessary for the decay of our manures; for when they are excluded from our dung-heaps, by these latter being closely packed and tramped, they do not ferment, but the matters of which they are composed remain in the same state in which they were heaped together; so in a great measure do they remain in an unmoved soil. "In a soil," says Liebig, "in which the air has no access, or at most but very little, the remains of animals and vegetables do not decay, for they can only do so when freely supplied with oxygen, but they undergo putrefaction, for which air is present in sufficient quantity. . . . The frequent renewal of air by ploughing, and the preparation of the soil, especially its contact with alkaline metallic oxides, the ashes of brown coal, burnt lime, or limestone, change the putrefaction of its organic (animal and vegetable) constituents into a pure process of oxidation; and from the moment at which all the organic matter existing in a soil enters into a state of oxidation or decay, its fertility is increased."

Now animal and vegetable bodies in a state of putrefaction are not in a state to afford nutrition to plants; on the contrary they are injurious, their strong attraction for oxygen, which they require to enable them to enter into a state of decay, "depriving everything in contact with them, even the roots and plants themselves," of a portion of their oxygen. It is not, indeed, till, by a free admission of air, they have been enabled, by the absorption of its oxygen, to enter into decay, that they are able to give out nutritious compounds to plants.

I have thus found salt, in a dry season, deprive the soil of the little moisture in it, so as to prevent the vegetation of Barley for several weeks, until rain fell; whereas where the salt was not used, the Barley came up in reasonable time.

It has been objected to fallowing, that the frequent stirring of the ground assists and promotes the escape of much nutritious matter, in the form of gases, from the soil; and that great chemist, Sir Humphry Davy, was of this opinion; but since the discovery of Way, that the aluminous particles of the soil have so strong an affinity to ammonia that water will not wash it from them until they are saturated, this objection is in a great measure removed; yet admitting that there be an escape of nutritious gases from the soil in fallowing, yet it would not exist in the case of a cropped fallow, for the growing plants would take up by their leaves probably all those matters which escape from the soil in gases, and for which purpose Nature has evidently furnished them with the orifices on their lower sides; and, again, supposing there to be a loss in naked fallows, it furnishes us with a still stronger proof in favour of fallowing, as evidence of its powerful effects in bringing into action the inherent nutritious powers of the soil; for if the land can afford to sustain this loss, and yet, after a year's fallowing and exposure, is made to produce a crop which it would not have done before, how great must be the fertility called forth by this operation.
*J. M. Goodiff, Granard, Feb. 8.*

## Home Correspondence.

*The Guano Trade.*—The great importance of guano to the interests of British agriculture induces me to ask a little space for a remark or two on your Leader of the 19th inst. You mention some errors which had been fallen into by a previous correspondent, for the purpose of throwing discredit on his statement, and which, as I quite agree with him in the spirit of that statement, I will shortly explain before proceeding further. First, you say he erroneously states the price at 10*l.* a ton, the importers' price being really 9*l.* 5*s.* Very few farmers, indeed, can take the guano at the importers' price, as they do not sell in quantities less than 30 tons; and as, in almost all cases, it must be either reshipped or sent by land into the interior of the country, it very seldom costs the farmer at his own place less than 10*l.* a ton. Next, you say he is "wrong again" in naming Messrs. Gibbs, Bright, and Co. as the importers, Messrs. Antony Gibbs and Sons being the sole importers. Surely, this is a very venial error, Messrs. Gibbs, Bright, and Co. being, in so far as the public are concerned, the Liverpool branch of Messrs. Antony Gibbs and Sons, of London, and the importers into Liverpool, and wholesale agents for the article. On these two points, therefore, your correspondent has not greatly misled your readers. Another, which he does not seem to have urged, and which admits of no dispute, is this, that whereas guano is now being brought from the guano islands at about 3*l.* a ton of freight, which last year cost 4*l.*, and previous to that 5*l.*, it is quite clear that, whatever the farmer can afford to pay for it, the importers can afford to sell it from 1*l.* to 2*l.* a ton cheaper, with the same margin as formerly for the Peruvian Government. If they could afford to sell it at 9*l.* 5*s.* when they paid 5*l.* a ton for freight, they can equally afford to sell it at 7*l.* 5*s.* when they pay only 3*l.* It is needless to tell us about payment to English bondholders, shipping charges, commissions, &c. These were all paid before, and the fall in the rates of freight is clear profit to the Peruvian Government or the importers, if they decline to share it with their customers. Now, if this was an open trade, I agree with you, that the importers are entitled to sell the article at the highest price they can obtain for it, and take all the usual fair advantages that the current of events may favour them with. But as it is a monopoly, we are entitled to inquire whether, when the privilege becomes greatly abused, it is not possible to adopt a remedy. The discovery of Ichaboe caused an instant fall in the price of Peruvian guano of one-half. We know that the guano islands of Peru are nearly inexhaustible, and there can be no doubt that the discovery of another source of supply would at once defeat this monopoly. But the farmers of England, who have so important an interest in this question, are entitled to ask at the present moment the sympathy of their own Government, and to hint to the Foreign Secretary the propriety of his making some arrangement with the Peruvian Government by which the guano trade may be thrown open with equal advantage to that Government, and their bondholders, and manifest gain to the landlord and shipping interests of this country. Instead of the 140,000 tons doled out to us by the "only" importers in 1850, we should soon see at least the 280,000 tons which the unfettered enter-

prise of our merchants found for us in 1845. *James Caird, Baldoon, N. B.* [There is no one for whose opinion we entertain more sincere respect than Mr. Caird. Nevertheless, he must permit us to remark, that in all things exactness is important, and in nothing more so than in such a question as has been raised upon the guano trade. Inaccuracies in an ascertained point, lead to suspicion of inaccuracy in other matters out of sight; and, we own that until we have some evidence that freights have been reduced from 5*l.* to 3*l.* we must doubt that fact. What we want to show is, that the importers are not the persons to blame for the price of guano; and that they are not monopolists. The monopoly is in the hands of the Peruvian Government: and their agents, who sell it on their account, have nothing to do with it. If Lord Palmerston can succeed in inducing the Peruvian Government to direct the price to be reduced, no one will rejoice more than ourselves.]

*Preparation of Peat Charcoal.*—Having observed an inquiry in a late Number of your Paper, respecting the best method of preparing this manure, I have great pleasure in informing you, that some years ago I had several hundred loads prepared by an Irish family, at 9*d.* per square yard. The plan followed was simple enough. Sods were cut out of the bog early in spring, and set on edge to dry; after remaining for several weeks a cart load of brush-wood and a few coals were put down, and the dried sods carefully built over them, in a conical shape, holes being left at top and bottom to facilitate the draught of air. The fire was drawn out at the bottom holes, and a fresh layer of sods piled all round and over the top of the first mound. In this way the work proceeded, until I had sometimes as much as 700 square yards in a heap. The men earned 18*s.* a week, but I do not consider them over paid, as the work required great attention, especially in windy weather, when there was a danger of the fire burning too fast. The peat should only be charred, and it made an excellent manure when applied at the rate of 25 to 30 carts to the acre. *C. E. L. T.*

*Experience in Land Draining.*—So little has the right draining of clay land been understood, that at the present day we find land drainers disputing as to the depths, distances, directions, and materials for the drains. We cannot, therefore, be surprised to find conflicting opinions given, based on experience, as to the results of draining. I must confess, with very few exceptions, I cannot recal instances of draining done four years ago that I would point to as having been sufficiently well done to be effectual; and even of the draining doing at the present day, by far the greater part is being badly done, and will be found to be but partially effective. Were the views of the land drainers rightly limited to the mere prevention of mischief, from standing water (and I fear much of the draining that has been done has been laid out with none other), then the question of assisting the draining by ridging would be unimportant. But the prevention of mischief is by far too narrow a boundary to limit the utility of draining to. The descent of rain has been clearly shown to carry both warmth and nutriment into the soil, whilst its passage over the surface takes both away. The extent to which land is fertilised by the passage of rain through the ground, has, I conceive, as yet been far too little considered. The action of rain in its descent is to dissolve and carry both organic and inorganic matter into the soil, and I imagine the earth owes its continuous power of supporting vegetation mainly to the supplies of nutriment which are thus brought to the roots of vegetation, and which, but for this solving and carrying action of rain, would soon be exhausted. It is from a want of understanding this use of rain that the practice of laying up of wet ground into high ridges, so that the rain shall rapidly pass into the furrows and away, has prevailed; and farmers, in their anxiety to preserve their crops from injury from standing water, have been guarding their land from rain, as if it were poison, and they have been discharging it into their ditches, unmindful of the loss of manure, and of the good its descent would do their land. This being so, we should not readily trust to any one's experience as to the occasion for continuing the old 8 feet ridges, after the land has been *well* drained. I can only say that mine leads me to believe that the strongest clays may be laid sufficiently dry by drains of 4 feet depth, and at 25 feet distance, and without the assistance of ridging, which, for reasons I have given, I think very objectionable. *Hewitt Davis, 3, Frederick's place, Old Jewry.*

*The Present State of Irish Agriculture.*—A nation whose agriculture is feeble and imperfect, cannot be really prosperous, no matter how advanced its progress be in the other arts. Agricultural education becomes, therefore, a subject of paramount importance in Ireland, where agriculture not only constitutes the chief employment of the people, but an occupation pursued with a total disregard to every scientific fact, and a reckless abandonment of all order and routine. The effects of such indifference may be clearly found in the periodical calamities which have overspread the country. This indifference must be resolutely grappled with, and made to surrender to a more enlightened exposition of husbandry. The prepossessions of centuries require to be treated with a gentle hand, by consolidating a sound wholesome system of education, which time aided by reflection will show the errors into which our people are plunged. Agricultural education is daily becoming more immediately required as an elementary branch of instruction, towards the accomplishment of a useful member of society. Agricultural literature is taught in the elementary schools of Switzerland, Prussia, Germany; and the Russian capital acknowledges the value of such information. The people of the United States are loud in demanding State agricultural schools. English and Scotch Universities, the Queen's Colleges, all communicate the same kind of knowledge. Would that some of our landlords had graduated in agricultural science, then we might have been spared the recital of those unhappy differences between landlord and tenant, and had a more exalted adjustment of a tenant's rights. In Ireland the humbler classes have not been forgotten in sharing in the advantages of industrial knowledge. The National Board have wisely considered the agricultural education of the people a primary concomitant to the success of their system. They have established an extensive Model Farm, at Glasnevin, near Dublin, where instruction in the theory and improved practice of agriculture is given by a highly qualified master. They have annexed small farms to many of the village national schools dispersed over the country, from which the most deserving pupils are drafted to the Glasnevin Model Farm, and there, by a higher course of instruction, and a more extensive field of practice, are fitted for the various situations as agriculturists, land-stewards, &c. Thus a number of young men are interspersed over the country—they settle down and become agents in the march of industrial happiness—disseminating the seeds of practical intelligence by the steadiness of their own examples. What system of education so cheap—so practically useful, can elevate the lower and middle classes of the community from that moral, social, and rural ignorance to which they are enslaved? How are we to attack the strong-holds of prejudice and error in husbandry except by thus practically elucidating solid and material improvements on model farms, however small: for a farmer who knows how to farm, will have his farm in good condition and productive, be it large or small; a farmer who is idle and ignorant will farm badly were he to have a county in his holding. To raise the depressed condition of Ireland, I see no means so surely, so safely, or so permanently calculated to effect the purpose as education—literary and agricultural combined; to impart intelligence with industry—to create a prosperous and a happy people. The desire of knowledge well directed and wisely applied is likely to produce healthful impressions. *Libra.*

*Agricultural Education.*—In your Paper of the 29th of March you made some judicious remarks on the management of small farms; and as the subject is important, I beg to call still more attention to it. Some people regret that the free admission of foreign corn must of necessity sweep away our small occupiers, and drive them into the labourer's ranks, or compel them to emigrate. This would indeed be a deplorable alternative, but I conceive there is no necessity for it. And as the safety, happiness, and prosperity of a nation depends more on the comfortable condition of the industrious classes than on the wealth of the affluent, I will try to point out means by which the labourers and little farmers, aye, and great ones too, may be benefited. There is more need of improvement in small farms than large ones, though it is greatly needed on both. The occupiers of both may take many valuable hints from labourer's allotments and market gardens. If they were rightly trained from youth, those small occupiers and allotment labourers would be able to thrive better with low prices than the great farmers, the small cultivators being consumers of a considerable portion of their produce, for which they have always a certain ready home market in their own family. Since many old people will not abandon their old prejudices and old practices, we must attend particularly to the training of the young. Let us begin with the education of the labourer's children, who ought to become good cultivators of their own gardens, and some of them ought to be able to rise by their own industry, skill, and economy, to the rank of little farmers, and from their offspring others ought, by similar means, to have a chance of becoming farmers on a larger scale. To effect this, let the excellent plan adopted by the Commissioners of Education in Ireland be extended throughout the kingdom, but more especially in Ireland, Wales, and the Highlands of Scotland; *vide Agricultural Gazette*, page 203. Let us have a good agricultural school with a small school farm established in every agricultural parish, and two or three model farms in each county, together with a few agricultural colleges dispersed throughout the length and breadth of the land. And, in addition to the model farms, let the principal schools hire a field, or a portion of one, of a neighbouring farmer, for experimental ground. This should be a separate concern from the model farm, which ought to be conducted on more regularly fixed principles. It would be desirable that the experimental field should be of an equal quality, and that the field should be changed as often as requisite. For this purpose some neighbouring farmer might be induced, by a liberal tempting offer, to part with a suitable adjacent field, with the concert of the landlord or agent, who would hardly object, since the plan is calculated to improve the cultivation of his estate, even if it should be injurious to that individual field. Such proceedings would tend greatly to improve the condition not only of the labourers and small farmers, but of the great ones too, and the community at large. Present difficulties powerfully call the attention of landowners and agents to these matters; and it is to be hoped they will zealously promote such means of improvement, and that in benefiting others they will actually promote their own interest, for we can hardly do good to others without sharing more or less in the benefit. This remark applies to the Government, which, with a paternal care that would secure its stability, should ever hold out a fostering hand for the encouragement of industry and enterprise, but without meddling too much, so as to cramp the efforts of those who should be left as free as possible. And what more agreeable and generally beneficial subjects can engage the attention of our rural and other legislators than such as tend to promote the productiveness of our own land, and the comfort and well being of its inhabitants, particularly its industrious classes. Mr. Davis and Mr. Smith's plan for trench-digging the wide intervals between growing crops is much to be recommended. Let science guide the hand of industry, and success will crown their efforts. *O. F.*

*The Acre.*—Permit me to offer, for the guidance of several of your inquiring correspondents and the public in general, the difference of an English and Irish acre of land. The difference is 300 square yards:

| | English Square Measure. | Irish Square Measure. |
|---|---|---|
| 30¼ yards are 1 pole or perch.... | 49 yards are 1 pole or perch. | |
| 1210 ,, are 40 poles or 1 rood.... | 1960 ,, are 40 poles or 1 rood. | |
| 4840 ,, are 160 ,, or 1 acre.... | 7840 ,, are 160 ,, or 1 acre. | |

English statute measure is reckoned by Gunter's chain of 100 links, of which 10 square chains constitute one acre. *Hardy and Son, Maldon, Essex.* [Can you give us the Cunningham and plantation acre, the Cornish, Cheshire, Scotch, and others, to complete the table.]

*Skylarks.*—The skylarks were destroying and continue to destroy my spring crops of Wheat, Rye, Barley, Oats, Beans, Peas, and Vetches, and the fact of their so doing will produce another fact, that I must discontinue such spring sowings if I can devise no means of arresting their deadly depredations. And another fact will be the result, that very many able-bodied labourers and their families will be denied that employment which would keep them out of the poor-houses here, or perhaps swamping your labour market in England, or your pauper markets, if I may use the expression, towards the large cities and towns throughout "happy" England, where "unhappy" Irishmen are wont to congregate. How on earth could Mr. Kidd, even with his "nimble pen," fertile brain, facetious turn, and elegant style, combat all these whilst he, with a humanity which all must admire, denies me the reasonable advice which I respectfully sought of him. I look forward with much interest to the letter which will contain the natural history of the lark, and am glad, for the sake of natural history itself, that I have broached this subject. Few people outside of this county, nor did I whilst in my early days in this my native county, think the dear lark to be so deadly a depredator on such crops as I have enumerated; so that if Mr. Kidd cannot on principle, a principle which I admire, assist me, I will presume to assist him in the natural history of the lark, whose principal food in this corn-growing county, at least, is the pulpy part of the germinated grain, discovered and ferreted out on seeing the young shoot over ground. No other bird that I am aware of seeks the grain in this stage so voraciously, except the rooks, whose depredations are nothing compared to those of the larks. The larks will occasionally extract from the husk or bran the Wheat, Barley, or Oats before vegetation sets in; but it is only in the stage which I have attempted to describe they do the irreparable mischief a thousand fold worse than that done by crows, who can be scared or shot, without any extraordinary cost; but I verily believe, a man, on every rood of land, with a deadly "Shilmalier," or "Queen Anne," in his hand, could not save the crops last March, at least, from the larks; and what makes the matter worse, if possible, the finer the tilth, the more readily they effect their purpose. I take leave to inclose a card for Mr. Kidd, that he may know my whereabouts, should he be disposed to favour me with a visit. I will certainly, if I can visit the World's Great Fair next summer, avail myself of the pleasure of waiting on him. In the meantime, I must remain grateful for his polite attention, in admiration of his beautifully written and highly interesting letters, as well as in devotion to his humane principles. *A Shilmalier.*

*Larks.*—I see by a note appended to Mr. Kidd's letter in reference to the lark question, that he doubts whether larks eat grain at all. I can assure him that the larks here are similar to their Irish brethren in this respect. I once had complete faith in their innocence, but growing suspicious I observed them more closely, and even committed the sacrilegious act of shooting four or five. A *post mortem* examination compels me to pronounce them guilty of eating Wheat, Barley, and Oats when sown, and even after the plant has sprung up through the ground, the latter, particularly with Wheat. I am astonished that Mr. Kidd, possessing so much ornithological lore, should be ignorant of this fact. Probably, the wide difference which he imagines to exist between his Richmond larks and the Irish ones, would be considerably narrowed if on some bright morning in the seed-time, he would take a walk in the corn fields, armed not with a murderous gun (I would not hurt his feelings by such a request), but with a good telescope. He would then perhaps see that his favourites charge a very handsome per centage for their musical services, fully more at this season in the shape of grain, than of wire-worms and insects I fear. The song of the lark

> "Soft is his lay and loud,
> Far in the downy cloud"—

is no doubt very beautiful, and comes in spring with additional relish, after a winter of London fogs, but it is a question, on both sides of which a great deal may may be said—whether after all the farmer does not pay too much for his whistle. *J. Foreman, Kinnaber, Montrose, N. B.*

*Spade Labour.*—I have read with much pleasure in your *Gazette* of the 29th March an article from the talented pen of the author of "The Word in Season to Farmers," and which I consider is one well deserving the attention of all parties interested in the present improving state of agriculture, and calculated to convince all incredulous speakers and thinkers that will not yield to anything but the plain alphabet of undeniable proof in such matters as seem from their complicated experience to be impossible. If farmers in general would practise the system adopted by Mr. Smith, what an immense good it would produce to the farmer, to the landlord, and particularly to the labouring classes, our humble brethren, by whose industrial labours the whole machinery of Society is kept in continual working: and all of such who are now inmates of the poor-houses, where they are supported at the expense of the farmer, in indolence and ease, might issue forth from the murky walls of their gloomy habitations, breathe a purer atmosphere, and become useful instead of burdensome to the farmer. Let 8 or 10 hearty labourers be set on an acre of ground with spades, and when these men are trained to the use of those tools, I have no doubt whatever but they will earn a moderate rate of wages and accomplish the work for the price quoted by Mr. Smith. The spade used should be one of proper construction, and to this point particular attention should be paid, not by the mere theorist, but by the practical spadesman—the man of head and hands. If the spade is too short it will cause unnecessary strain and fatigue of the body. On the other hand, if it be too long, the fault is even worse, as it will keep the workman at too great a distance from his work, in which position he will not be able to accomplish more than half the quantity of work which he would with one of a medium length, which cannot better be described than thus: the spade standing close by his side, the box-handle should fit under the armpit of the man who works with it; one of this description, 18 inches to be occupied by the handle, will suit the capacity and convenience of every workman according to his dimensions. If any person doubt the truth of these peculiar remarks, let him practise and advise others to practise, and I warrant he will experience the truth of them. By spade labour can the fresh subsoil be brought up (and which no horse-power could accomplish to such perfection) to do the duty for which Nature provided it, and when exposed to the action of the various chemical agents which the atmosphere eternally supplies, will tend to a considerable saving of manure, and with the Tullian system of cropping will enrich the farmer with an abundant harvest, the landlord by enhancing the intrinsic value of the land, and the labourers, as I have said before, by affording so much employment. By spade-labour, in deepening the soil, we shall find the rich treasures which our forefathers allowed to remain, where the two sons of the dying man, related in the parable, found the treasures which he bequeathed to them between 18 inches and the top; and if we go a little deeper, we shall find more; and if the system should be once generally adopted, in a few years we should find the fertile soils of the sister isle to equal in worth the golden soil of California. Objections may be raised to some of the items in the balance sheet of Mr. Smith, but I think if the man who would make them would set about the experiment economically, and on a fair stratum of land, he will, in course of time, have reason to credit and coincide with Mr. S. in his statements. I think the experiment of "Amicus Tull" could not be looked on as a fair trial, his land being so extremely hard and difficult to trench, having to be worked with a pickaxe, while that of Mr. Smith was, and could be, worked with the spade; and even that, admitting it might have been an average of his own farm, on which he tried the experiment, the first trenching was the hardest to be done, and therefore the dearest, and will save him the same trouble at least for seven years to come, during which time annual diggings from 10 to 14 inches in depth will be found sufficient. Neither is it essential for proprietors to employ no other than a man of such major dimensions as that described by "Amicus Tull," for I think it is more by the heart and will of a man than by the bulk of his body that the work is done. The only objection to all Mr. Smith's statements is, that though he will admit of manuring, yet he is far from being an advocate of that valuable stimulant to vegetation, the intrinsic value of which, with any method of tillage, is too well known to need any superfluous comment. Hoping he will add to his valuable work the use of manures, and hoping it may succeed in its objects, the system may still be adopted and theorised, I conclude with the Irish phrase of "God speed the spade." *E. F., Phœnix Park, Dublin, April* 10, 1851.

*Allotment Culture.*—I have for several years cultivated a plot of land to advantage, having grown some very superior crops of Wheat, Beans, Barley, and roots. I have grown Wheat at the rate of 6 quarters 5 bushels and 6 gallons per acre, from a crop dibbled at the rate of a bushel per acre; but I have since grown crops equally as good from a half bushel per acre, dibbled by Dr. Newington's hand-dibble, which is by far the best implement I have yet seen, by which small holders can deposit their seed. A half bushel of seed is amply sufficient when dibbled early in September in a good and well-cultivated soil. I have this season a very superior crop of dibbled Wheat on a plot of ground dibbled at the rate of a half bushel per acre; if there be any fault in it, it is too thick. I generally hoe my Wheat four times, which I consider to be greatly advantageous to the growth of the plant. I have grown surprising crops of Barley, cultivated in the same manner as the Wheat. I generally plant my Long-pod Beans in double rows, at 3 feet apart, and interline a row of roots or Cabbages. I have hitherto found the interlining system to answer very well indeed. I intend next October to commence getting five crops from the same piece of ground, which can be easily done within the space of 13 months, a plan of which is given in the *Agricultural Gazette* of the 29th March, at page 203. Stirring frequently between the rows of all kinds of root crops greatly improves their growth; the best instrument for that purpose is that very excellent implement of Dr. Newington, which he calls his hand row-hoe or cultivator; it is equally adapted for hoeing Wheat or any kind of crops sown in rows. I have this season used the three-pronged fork instead of the spade, and like it much better. It can be worked with greater ease, and does its work more effectually. Those with whom it is not convenient to trench their land should dig it with a fork to the depth of 14 inches, as does John Sillet, of Kelsale, near Saxmundham, Suffolk, who gets his living off 2 acres of land. I would strongly recommend his pamphlet on "Spade Husbandry" to the notice of all small holders. I have just prepared a piece of ground for Swedes, and as I do not want to bury the manure deep in the soil, I am at a loss how to cover it; but it has just occurred to me how this difficulty might be overcome. After the manure is spread, a man with a breast plough could easily turn it over to the depth of 2 or 3 inches, but it would take a long time in doing. If Dr. Newington would attach a kind of plough-share and shell-board to his cultivator, I think it would cover the manure famously at almost any depth you please, and this kind of plough would be also famous for ploughing and stirring the soil after being dug with the fork. This addition would, in my opinion, be a great improvement, and make the implement complete, and prove very beneficial to all small holders. *W. Griffin, Eydon, near Daventry.*

## Review.

*Land Draining, Embankment, and Irrigation.* By James Donald, C.E. W. S. Orr and Co., London.

This is one of a shilling series of rural hand-books, commenced by the late H. D. Richardson, of Dublin, to some of the numbers of which we have already referred as they appeared. The present is by a gentleman who has occasionally contributed to our own columns, and whose practical skill and well informed mind are both well illustrated in the volume before us. It is a plain statement and description of the details of its subject which all can understand, and by which, no doubt, many will benefit.

METEOROLOGICAL REPORT.—April.

(*Continued from page* 253.)

| Date. | Time. | Max. | Min. | Wind.—Weather. |
|---|---|---|---|---|
| Apr. 16 | 11.10 a.m. | 29.68 | ... | E. Very heavy rain and stiff breeze all day. |
| * | 11 p.m. | ... | 29.55 | ENE. evening. Do. weather. |
| 17 | 5 a.m | ... | 29.56 | SSW. Brisk breeze, and warm pleasant day. |
| | 11 p.m. | 29.73 | ... | |
| 18 | 8 30 a.m | ... | 29.74 | Southerly. Moderate breeze, and pleasant day. |
| | 11 p.m. | 29 81 | ... | |
| 19 | 6..30 a.m | 29.88 | ... | White frost. Beautiful calm fine day, and very little wind. |
| | 6.40 p.m. | 29.87 | ... | Calm afternoon, and bright starlight evening. |
| | 9.45 p.m. | ... | 29.86 | |
| Sun. 20 | 8.20 a.m. | 29.60 | ... | a.m. northerly. Heavy appearance on edge of horizon at W. to NW., but nearly calm. Noon, easterly. Light breeze, and overcast. |
| † | 10 p.m. | ... | 29.38 | Evening, S., light. Damp mist. Night, very heavy rain. |
| 21 | 6.45 a.m. | ... | 29.43 | S., moderate. Overcast, but dry. Towards noon, began a heavy driving rain, which lasted till 6 p.m.; a very warm genial day. |
| | 11.15 a.m. | 29.45 | ... | |

* This would be a storm coming from the south, over France and Holland, and curving to westward of north, on overtaking the preceding storm.

† A storm coming from the westward, and passing over France to the south of east, being deflected from its proper course by the preceding storm.

Dorchester, April 24th. *F. P. B. M.*

(*To be continued.*)

## Calendar of Operations.

APRIL.

Essex Farm.—Since my last we have been doing nothing worth reporting; from the continued wet weather it has been impossible to get upon the land till within the last fortnight; we have finished sowing the Barley after Turnips, it being impossible to keep the sheep upon them to feed them off sooner; this is not the way we like, as it has always been found that early sown Barley yields best, sometimes as much as three quarters per acre difference, but it should never be put in till the land is in a fit state, if the weather will allow it. We have finished dibbing Carrots; this is the second year we have put them in this way, and though not so expeditious as drilling them, it saves much labour when they are fit to single out, as well as allowing us to put into the hole, after the seed is dropped, a small handful of a mixture of guano and burnt earth saturated with urine; this helps the young plant on rapidly in the spring months. The way we dib them in is with a dib with five points set in a frame six inches apart, having a double handle, the man setting his foot upon the frame, making the holes 2½ inches deep. The land is well "menued" in the autumn with farm-yard dung, and ploughed twice before Christmas, if possible; it cannot be too fine. It is left the last time ploughed before dibbing on bouts, the holes being made along the top of the bout, this leaves a space of about 18 inches between the rows, which is a good distance to get between with a horse hoe. Carrots are so well liked by all cattle that we grow more every year; we have also put in the Mangold, both the long red and orange globe; the latter I think the best, but the red keeps longest, and it makes a change to the cattle; we dib them in with the same dib as I mentioned for Carrots. They are dibbed on yard ridges; they are ploughed between two or three times during the summer, as well as horse hoed; they have been found most valuable his spring; as the Clover and Grass has not as yet started at all, there cannot be anything except for sheep these three weeks or a month; there are many farmers round who have had to buy already: the hay is almost all gone, and as the sheep have had to be kept on the pastures so late, I doubt much whether there will be a heavy crop of Grass. The ewes and lambs have been for these few last days on a field of red Clover, a little forwarder than the rest, but it does not stand before them any time, though they have Mangold Wurzel thrown down to them. The Wheat looks here most beautiful, a rich green, and tillering well, and lying close to the ground. The early sown Barley also looks well. *E. X., near Braintree.*

### Notices to Correspondents.

Books: *Filius Æsculapii.* Low's "Elements of Practical Agriculture" is as good a guide as you can have.

Dairy: *P T O.* Milk and cream will churn, although they be not sour enough to curdle.

Hotbed: *P T O.* Cow litter and dung will make one: which will maintain a lower heat a longer time than horse-dung.

Italian Rye-grass: *Tyro* It will not answer to let it remain another year; at least it has not generally answered, but you will be able to judge better a few months hence.

Mangold Wurzel: *F. C.* Your dairy experiences are attributable to the diet of the cows. Mangold Wurzel is apt to make the butter white, hard, and difficult to get.

Manure: *Burbage.* The following answer is, we are sorry, too late for your purpose. It is given from a practical judgment of the subject and not after consultation of chemical authorities. If 10 tons of soiled litter and manure just thrown out of feeding stall and stable be worth 30s, the same manure allowed to rot in a heap for 8 months may perhaps be 5 or 6 tons, worth 4s. a ton; but made into compost with earth and rotted, then it will be worth all its original cost, *plus* what value of labour may have been expended upon it.

Meat Produce: *Examiner.* We have to apologise for the delay. 20 tons of Swedes 26 cwt. of Clover hay, 40 bushels of Barley, 1 ton of oilcake, with a quantity of straw not specified, ought to have produced 9 or 10 cwt. of beef.

Potatoes: *A B.* They will, most likely, be the later for strong ammoniacal manuring; it will tend to the growth of leaf, though no doubt, if unchecked by disease, to that of tuber also. You may fold sheep and lambs on Pares towards the end of May. If they are very young, cut for them 24 hours in advance. Beans or Peas are better than oilcake as a corrective of looseness.

Poultry: *Lady M.* It is difficult, on the information given, to assign a cause for the mortality among the Dorking chickens. *With us*, the weather alone would be a sufficient cause, the last few weeks; but where Lady M resides, it may have been warm and genial. The answers to anonymous and undated inquiries cannot be so precise as they ought. Perhaps part of the stock wants changing.—*Mrs. M* Cooice Bantams are apt to suffer from being too carefully guarded. Good Barley would not give them the cramp. They require green food, worms and insects, broken egg-shells or burnt oyster-shells, and perhaps more air, sunshine, liberty, and dusting holes.

Southdowns: *T S.* Southdown breeders always advertise their annual sales. As to the cross between the southdown and blackfaced heath breeds, your question has been handed to a good authority.

Erratum. In the article published last week on the "Management of Steam Engines," there is an erratum, which should be corrected thus: "the coals *best* suited for household purposes are generally least suited for the engine" The one requiring coals that swell and cohere in the grate; the other working best with coals that open readily, and thus extend the surface for oxydation.

## Markets.

COVENT GARDE , April 26.

Hothouse Grapes are becoming very plentiful, and, considering the season, they fetch but indifferent prices. The same remark applies to Strawberries. Good Pine-apples are scarce, as are also dessert Apples. Oranges and Lemons are plentiful. Nuts remain nearly the same as last week. Vegetables of all kinds are abundant and good. French Beans are very plentiful. Carrots and Turnips are dearer. New Cornish Potatoes may be obtained at from 1s. to 2s. per pound; old kinds realise better prices. Lettuces and other salading are sufficient for the demand. The best Mushrooms fetch 1s. 3d. per pottle. Cut flowers consist of Heaths, Pelargoniums, Camellias, Mignonette, Double Primroses, Stephanotis floribunda, Cinerarias, Moss and Provins Roses.

15s. 3d.; Wallsend Adelaide Tees, 15s. 3d.; Wallsend Tees, 15s. 3d.—Ships at market, 104.

HOPS.—FRIDAY, April 25.

Messrs. Pattenden and Smith report that the market is steady and firm at late prices for all Hops with colour and quality.

POTATOES.—SOUTHWARK, April 21.

The Committee report that the market continues to be moderately supplied, but quite equal to the demand, which is limited. The following are the quotations:—York Regents, per ton, 80s. to 100s.; Scotch do., 70s. to 80s.; ditto Cups, 60s. to 70s.; Cambridgeshire and Lincolnshire Regents, 60s. to 80s.; French whites, 60s. to 70s.

SMITHFIELD, MONDAY, April 21.

We have a shorter supply of Beasts, but there are more than can be sold, even at reduced prices. Being Easter week there is a small attendance of buyers. The number of Sheep is considerable for the day, the demand excessively small; a large proportion remain unsold. Lambs and Calves meet with a dull sale at lower rates. From Holland and Germany there are 222 Beasts, 900 Sheep, 139 Calves, and 87 Pigs; from Norfolk and Suffolk, 2000 Beasts; from Scotland, 500; and 100 from the northern and midland counties.

| Per st. of 8 lbs.—s | d | s | d | Per st. of 8 lbs.—s | d | s | d |

| Half-breds ... 4 | 0 — 4 | 4 | | Calves ... ... 2 | | 8 — 4 | 0 |
| Ditto Shorn ... 3 | 6 — 3 | 10 | | Pigs ... ... 2 | | 8 — 3 | 6 |

Beasts, 3254; Sheep and Lambs, 22,560; Calves, 194; Pigs, 400.

FRIDAY, April 25.

The number of Beasts is not very large, but more than adequate to the demand. The small amount of business that is transacted may be quoted as on Monday. The supply of fresh Sheep is small; some of those left from Monday are on offer today, and a few lots of foreigners. Trade is still very bad, and prices remain about the same, although there is more disposition to purchase. Lambs are more in demand. Trade is very heavy for Calves, and prices are with difficulty maintained. From Germany and Holland we have 52 Beasts, 330 Sheep, and 198 Calves; from Scotland, 100 Beasts; from Norfolk and Suffolk, 300; and 85 milch cows from the home counties.

| Best Scots, Here- | | | | Best Long-wools . 3 | | 8 to 4 | 0 |
|---|---|---|---|---|---|---|---|

Beasts, 645; Sheep and Lambs, 6000; Calves, 326; Pigs, 410.

MARK LANE.

MONDAY, April 21.—The supply of English Wheat was again short this morning; the best samples realised about the prices of this day se'nnight, but out of condition parcels, of which it principally consisted, were a heavy sale at a decline of 1s. to 2s. per qr. for Essex, while that from Kent remained unsold at a late hour, although offered at a reduction of 2s. to 3s. per qr. Foreign Wheat is in limited demand, and its value is nominally unaltered.—There is very little Barley offering, which brings fully late rates.—Beans and Peas meet a fair sale at former prices.—Oats are taken at the quotations of this day week.

| PER IMPERIAL QUARTER. | s. s. | | s. s. |

FRIDAY, April 25.—The arrivals of grain this week have been moderate. The attendance at market on Wednesday and this morning was thin, and the English Wheat left over from Monday is still undisposed of. The demand for foreign is of such a retail character that we cannot alter our quotations.—Barley, Beans, and Peas are unaltered in value.—Oats are in good inquiry, and rather more money was realised.—In Flour there is scarcely anything doing.

LIVERPOOL, TUESDAY, April 22.—The arrivals from Ireland and coastwise during the week have been insignificant, but from foreign ports supplies have been pretty liberal. Owing to the intervention of the Easter Holidays, the trade since Tuesday last has been very quiet, without perceptible alteration in the value of any article. At this day's market there was a fair attendance of buyers, who, however, acted with much caution, and only a small business resulted. Fine fresh Wheats were in fair request at late rates, but inferior sorts were easier to buy. Flour must be noted 6d. per sack and barrel lower. Fine mealing Oats were saleable at full prices, but inferior qualities difficult to move, except at a decline of ½d. per 45 lbs. There were several buyers of Barley for Wales in attendance, and, being scarce, realised an advance of 1d. per 60 lbs. Beans and Peas without change. Indian Corn meta little more attention at last Tuesday's prices.——THURSDAY, April 17.—The supplies of grain and Flour have been moderate for the last two days, with the exception of about 7000 sacks of French Flour. The weather has broken, and we have had cold easterly winds with rain. The grain market has been without activity since Tuesday, and no material change has occurred in the value of Wheat, Flour, Indian Corn, or any other article. The usual holiday season has much interfered with business.

GRASS AND OTHER SEEDS.

THOMAS GIBBS AND Co., the Seedsmen to the "Royal Agricultural Society of England," corner of Half Moon-street Piccadilly, beg to call the attention of their friends to the following Seeds:

Mixtures of selected Natural Grasses for laying down Land to permanent Meadows and Pastures, apportioned to suit the nature of the soil.
Mixtures for portions of Parks near Mansions.
Mixtures for Garden Lawns and Grass Plots.
Mixtures for renovating Old Pasture Land.
Italian and other Rye-grasses.
White Belgian and Red Altringham Carrots.
Gibbs' new very large Parsnip.
Orange Globe Mangold Wurzel.
Long Red and other kinds.
Drumhead and Thousand-headed Cabbages.
Swedes, Hybrids, and other Turnips.
Clovers, Kohl Rabi, French and English Furze.
Sainfoin, Rape, Tares, White Mustard, and all Agricultural and Kitchen Garden Seeds, &c.

Priced Lists are now ready, and will be forwarded free, on application, by post, or otherwise, to corner of Half Moon-street Piccadilly, London.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND CO. beg to notice their mixtures of GRASS SEEDS for Laying Land down to Permanent Grass, are now ready for delivery. They have reduced the price to 30s. per acre, allowing 2 bushels 12 lbs. to the acre.

Mixed sorts for improving old Grass Land, 1s. 2d. per lb.

Fine sorts, for forming Lawns, 1s. 3d. per lb. Directions for sowing will accompany the Seeds.

GEORGE GIBBS and Co. will feel happy in sending general priced Catalogues of Agricultural and Garden Seeds, on application to 26, DOWN-STREET, Piccadilly, London.

HARTLEY'S PATENT ROUGH PLATE-GLASS FOR CONSERVATORIES, &c.

See Article in the GARDENERS' CHRONICLE of Saturday, December 8, 1849.

"Continued experience leaves us no room to doubt that this is the best material yet produced, and that it will in time supersede glass of all other kinds for the greater part of Gardening purposes." . . . "As for the article substituted for Rough Plate . . . it is wholly unfit for any horticultural purpose." . . . "The best sample of it which we have yet seen was Manufactured by MESSRS. HARTLEYS, AND SOLD BY MESSRS. JAMES PHILLIPS & CO., 116, BISHOPSGATE STREET."

See the *Gardeners' Chronicle* first Saturday in each month.

GREENHOUSE AND CONSERVATORY BUILDING ESTABLISHMENT, HOT-WATER APPARATUS MANUFACTORY, KENSALL-GREEN, HARROW-ROAD, LONDON.

JOHN TAYLOR begs most respectfully to call the attention of the Nobility, Gentry, and Gardeners, to the very superior manner in which he erects all kinds of Greenhouses, Conservatories, Forcing Pits, &c., and all other buildings for Horticultural purposes, combining all the most modern improvements with elegance and utility. His manner of heating Horticultural Buildings, Churches, Chapels, Public Buildings, Entrance Halls, &c., has received the greatest approbation from the Nobility and Gentry by whom he has been extensively engaged.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

WARRANTED BEST MATERIALS AND WORKMANSHIP, AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

PURVEYOR TO HER MAJESTY, H.R.H. PRINCE ALBERT, AND THE KING OF THE NETHERLANDS.

JOHN BAILY, 113, Mount-street, Grosvenor-square, London, Dealers in all sorts of USEFUL AND ORNAMENTAL POULTRY; Domesticated Wild Fowl; Gold, Silver, and common Pheasant Eggs for Hatching; all sorts of Fancy Fowls' Eggs, large Aylesbury Ducks, &c.

BAILY'S registered PHEASANT AND POULTRY FOUNTAINS, by which Birds are ensured a supply of clean and wholesome water, and the lives of thousands of Chickens and Pheasant Poults saved—1¼ quarts, 17s. 6d.; 7 quarts, 15s. 6d.; 3 quarts, 13s. 6d. Drawing and particulars forwarded by post on application.

BAILY'S "Hints for the Management and Fatting of the Dorking Fowls for the Table," price 1s. 6d.

BELFAST.

THE IMPROVED FLAX MACHINERY.—Persons wishing to erect Mills for preparing FLAX from the Straw can be supplied with the IMPROVED MACHINERY, recommended by the Royal Flax Society, on application to the Makers, M'ADAM, BROTHERS, and CO., Engineers, Soho Foundry, Belfast.—April, 1851.

DRAINING.—A Country Land Agent and Surveyor, having several extensive contracts for Draining Land near London, will give practical instruction on Draining, Tile-making, and Levelling (and Land Surveying, if required).—Address, by letter, to A. B., 2, Montague-street, Portman-square, London.

TO AGRICULTURISTS.

THE SUBSCRIBERS, in returning their sincere thanks to their numerous Customers for the liberal patronage which they have so long enjoyed, beg earnestly to solicit the attention of Agriculturists and their friends in England to their improved Light GRUBBER, combining both cheapness and efficiency. The Implement was strongly recommended by the East of Berwickshire Farmers' Club, at their meeting in December last; and the numerous parties who have since honoured us with their orders have expressed their high satisfaction with it as a most efficient Implement. The price, with travelling wheel, complete, is only 65s., delivered free to any station on the North British Line.

As the Turnip season is now approaching, the Subscribers take this opportunity of calling attention to their improved Turnip-sowing Machines, which they feel confident will give entire satisfaction to those who may favour them with their commands. The price is Six Guineas, and every attention will be given to the speedy execution of orders by

SCOULAR AND CO.,
Haddington, N.B. Agricultural Implement Makers.

ANTHONY'S PATENT AMERICAN CHURN.—In addition to the numerous testimonials already published, the following one has just been received:

"Huntingdon, April 14th, 1851.

"Gentlemen,—About a year ago I purchased of you one of Anthony's Double-Acting American Churns. My small dairy was then managed by a very obstinate servant, who hated novelties, and you are well aware that I was at first much disappointed with it; but I have now great pleasure, after some experience of the merits of the Churn, in adding my testimony to its great value.

"Instead of my servant being put out of temper as heretofore by turning the old-fashioned barrel churn from half an hour at least to sometimes an hour and a half, and being surprised with bad butter as the result of all her labour, I now can depend upon obtaining first-rate butter in 10 or 12 minutes. No dairyman ought to be without such a churn, and you are quite at liberty to make what use you please of this letter.

"I am, Gentlemen, yours obediently, CHAS. MARGETTS.

"To Messrs. KEY and Co."

For prices and further testimonials, apply to the Depôt, 103, Newgate-street, London.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, BREWERS' USE, &c.
FLEXIBLE INDIA-RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES for TUBING.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, Gas Fittings, Chemical and all purposes where a perfectly sound WATER-PROOF and FLEXIBLE PIPE is required.

Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently Flexible in all Temperatures, and are therefore particularly suitable for Fire Engines; and, from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes.

Testimonials and Prices may be had on application to the Manufactory.

Waterproof FISHING BOOTS and STOCKINGS, PORTABLE INDIA-RUBBER BOATS and BATHS, made to order.

N.B. Vulcanised India-Rubber Garden Hose fitted with roses, jets, and branches, complete, with union joints ready to attach to pumps or water cisterns.

All orders or letters addressed to J. L. HANCOCK, at the Manufactory (and Warehouse), Goswell-mews, Goswell-road, London, will meet with immediate attention.

## SALES BY AUCTION.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will Sell by Auction, at the Mart, Bartholomew-lane, on WEDNESDAY, April 30th, and FRIDAY, May 2d, a fine collection of CARNATIONS AND PICOTEES, AURICULAS, AND HEARTSEASE; also Climbing Roses in pots, Dahlias in dry Roots, Geraniums, Fuchsias, Verbenas, and other plants in bloom.—May be viewed the morning of Sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

EAST INDIAN ORCHIDS, AND A FEW FROM AFRICA.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King-street, Covent Garden, on FRIDAY, the 2d of May, at 12 for 1 o'clock, an importation of Choice ORCHIDS, from the East Indies. They have arrived in splendid condition per overland route, and comprise several new kinds, particularly a beautiful Dendrobium, a new Vanda, and fine plants of Saccolabium Blumeii major (true); Dendrobiums Dalhousianum, formosum, Chrysatoxum aggregatum major, tortile, and others. In the sale will be included some plants of the finest of all terrestrial Orchids, "Disa grandiflora," and some specimens of Angræcum caudatum from Africa.—May be viewed on the morning of sale, and Catalogues had of Mr. J. C. STEVENS, 38, King-street, Covent-garden, London.

ORCHIDS.

THE PROPERTY OF THE LATE GEORGE WALKER, Esq

MR. J. C. STEVENS is favoured with instructions from the Executors to submit to sale, by Auction, at his Great Room, 38, King-street, Covent-garden, on TUESDAY, 6th May, at 12 for 1 o'clock, the collection of ORCHIDS, removed from Eastwood-hall, Notts. It consists of a general selection of the most popular varieties, many of which are fine specimens, and well established plants.—May be viewed on the morning of sale, and Catalogues had of Mr. J. C. STEVENS, 38, King-street, Covent-garden, London.

ISLEWORTH, MIDDLESEX.
TO FLORISTS AND OTHERS.

MR. WATERER will sell by Auction, on WEDNESDAY, April the 30th, at 11 o'clock, Three GREENHOUSES, BOXES and LIGHTS, and 3000 GREENHOUSE PLANTS, Roses, Pinuses, &c.; by order of Mr. Stedman, declining that part of the business, which comprises the erection of three Greenhouses, with Cisterns, Flues, and Flower Stages, 2000 Greenhouse Plants, including a choice collection of Geraniums, Fuchsias, Mimulus, Verbenas, Heliotropiums, Cacti, Hoya imperialis, Lilium lancifoliums, Camellias, and other plants: 1000 potted Roses of the most choice sorts; Cedrus Deodaras, Araucarias, Pinus grandis, and a great variety of other choice plants. May be viewed the day previous and morning of sale.—Catalogues had upon the premises, and of Mr. WATERER, Auctioneer, Land and Timber Surveyor, Chertsey, Surrey, who will forward catalogues on application by letter.

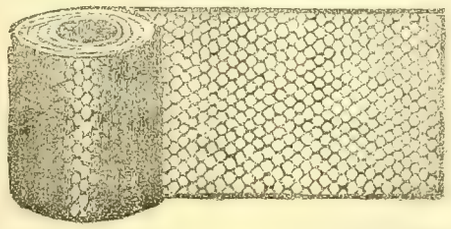
BEDFORDSHIRE.—Great Barford, near Bedford, Biggleswade, and Sandy.—Valuable Freehold Estate, tithe free and land-tax redeemed, giving votes for the county.

MR. EDWARD PALMER will sell by AUCTION, by order of the Mortgagee, at the Golden Cross Inn, Great Barford, near Sandy, Bedfordshire, on TUESDAY, 13th of MAY next, at One, in 11 lots, of about 3 acres each, an important FREEHOLD ESTATE, consisting of about 34 acres of land, all adjoining, and delightfully situate on an eminence facing the south, at the entrance of the village of Great Barford from Bedford, near the Wesleyan Chapel, having an extensive frontage to the road, and commanding a beautiful prospect. The land is of excellent quality, and suitable for building cottages, with garden ground attached, the cultivation of which in this neighbourhood has been found so exceedingly profitable, from the easy transit of vegetables by rail to the London markets.—N.B. Two-thirds of the purchase-money may remain on mortgage if required, or the whole, if satisfactory security is given.—Particulars, with plan and conditions of sale, may be had 14 days prior to the sale, of Mr. BENJ. CHANDLER, Jun., Solicitor, Sherborne, Dorset; Messrs. POOLE and GAMLEN, Solicitors, 3, Gray's-inn-square, London; Mr. W. WALLEN, Jun., Architect and Surveyor, 14, Basinghall-street, city, and Greenwich, Kent; at the Law Property Assurance and Trust Society's offices, 30, Essex-street, Strand; at the Golden Cross Inn, Great Barford; Swan Inn, Bedford; White Swan, Biggleswade; and at the Auctioneer's Offices, 20, Change-alley, Cornhill, London.

THE MOST SUPERB BED OF TULIPS IN EUROPE.

MR. R. LAWRENCE, of Hampton, will sell his unrivalled bed of TULIPS, of the splendour of which some idea may be formed by the number of fine varieties: viz. 30 Louis XVI., 16 Musidora, 12 Pompe Funebre, 12 Fabius, from 4 to 10 each of Bysantium, Pandora, Parmigiano, Brown's Polyphemus, ditto Ulysses, Dicken's Duke of Devonshire, Marcellus, Rose Arlette, Lyde's Queen of Hearts, Brown's Magnificent, Strong's King, Nora Criena, Thalia, Vivid. Besides several each of Lac, Coronation, Iago, Apelles, Salvator Rosa, Lord Collingwood, Marshal Soult, Selim, Groom's Queen Adelaide, Lady Exeter, Laura Lawrence, Hepworth's Queen of the North, Dutch Ponceau, Goldham's Maria, Brown's Sylvia, Jeffrey's Elizabeth, La Belle, Nanette, Lawrence's Lady Sale, and nearly every flower that has been raised worth cultivation, by Lawrence, Clarke, Lyde, Dixon, Strong, Walker, Glenny, Goldham, Brown, Groom, &c. Persons desirous of receiving Catalogues, may send their addresses to Mr. R. LAWRENCE, Red Lion, Hampton (where the bed may be seen, from the 1st of May to the day of sale); Mr. LOCKHART, 84, Fleet-street; and Mr. GLENNY, Strand. Catalogues will also be forwarded to the principal Seedshops.

FOR PUBLIC SALE, at the New Corn Exchange Tavern, Mark-lane, on MONDAY, 28th April, at 2 o'clock precisely, about 350 Tons GUANO, imported from Valparaiso.—Catalogues and further particulars in due time from J. A. RUCKER and BENCRAFT, Brokers, 26, Commercial Sale Rooms, Mincing-lane, London.



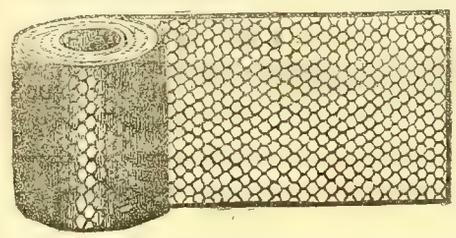
FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

TO BE LET, a HOUSE, with Four Acres of LAND, on the Brighton Railway—Rent, 20*l.*; pleasantly situated, facing the clump of trees adjoining the Horley Station, one hour's distance from London-bridge. An excellent opening for a Market Gardener. The two best rooms, which have French casement windows, would let furnished during the season to pay the rent.—Enquire of the Station Clerk at Horley, who will point out the premises and give the Landlord's address.

TO BE LET, on moderate terms, a NURSERY GARDEN, with a comfortable House, Green and Hothouses, and about an acre of land, with a very improving business, and good neighbourhood, situated close to a market town, and within a few miles of other good market towns. Tenancy to commence at Michaelmas next; or, if required, arrangements could be made for immediate possession.—For further particulars, apply to A. Z., Office of this Paper.

GALVANISED WIRE GAME NETTING.—
*7d.* per yard, 2 feet wide.



| | Galvanised. | Japanned Iron. |
|---|---|---|
| 2-inch mesh, light, 24-inch wide ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch " strong " ... | 9 " | 6½ " |
| 2-inch " extra strong " ... | 12 " | 9 " |
| 1½-inch " light " ... | 8 " | 6 " |
| 1½-inch " strong " ... | 10 " | 8 " |
| 1½-inch " extra strong " ... | 14 " | 11 " |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

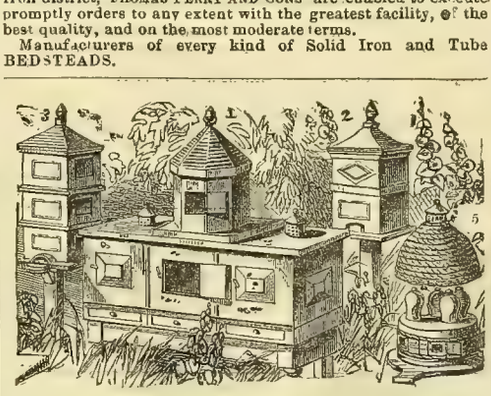
| | | | | | |
|---|---|---|---|---|---|
| 12 inches wide | 3*d.* per yard. | | 30 inches wide | 7½*d.* per yard. | |
| 18 " | " 4½*d.* | " | 36 " | " 9*d.* | " |
| 14 " | " 6*d.* | " | 48 " | " 1*s.* | " |

Galvanised do., 1*d.* per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each. Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wirework; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

IRON GATES, HURDLES, WIRE WORK, &c.

THOMAS PERRY AND SONS,
252, OXFORD-STREET (NEAR HYDE-PARK),
And Highfield Works, Bilston, MANUFACTURE all kinds of Park Entrance, Carriage and Field Gates, Wickets, Wrought and Cast Iron Gate Pillars, Plain and Ornamental Fencing, Palisading, and Balconies.



Ox, Cattle, Sheep and other Hurdles;

Tree Guards, Garden Seats, Garden Rollers, Wheelbarrows.

Hay Racks, and Stable Fittings, &c., and Wrought and Cast Iron Work of every description. Wire Work in great variety, comprising Gothic and other Fencing, Flower Stands, Trainers, Arches, Pheasantries, &c.

The works being situated in the centre of the Staffordshire Iron district, THOMAS PERRY AND SONS are enabled to execute promptly orders to any extent with the greatest facility, of the best quality, and on the most moderate terms.

Manufacturers of every kind of Solid Iron and Tube BEDSTEADS.

BEE HIVES, as shown at the GREAT EXHIBITION of 1851, by GEO. NEIGHBOUR and SON, 127, High Holborn, London. No. 1, Nutt's Collateral Hive; 2, Improved single Box-Hive; 3, Taylor's Amateur Bar-Hive; 5, NEIGHBOUR'S Improved Cottage Hive, working three or five Glasses; the Ladies Observatory Hive, &c. &c.

A priced Catalogue, with drawings and particulars, forwarded on receipt of two postage stamps.

AGENTS.—Liverpool: Wm. Drury, Castle-street. Manchester: Hall and Wilson, 50, King-street, Glasgow: Austin and M'Aslin, 168, Trongate.

THE BIRMINGHAM CATTLE SHOW, 1851.

THE PRIZE LISTS FOR CATTLE, SHEEP, PIGS, and POULTRY, are now ready, and Copies may be obtained from the Honorary Secretary.

T. B. WRIGHT, Hon. Sec.
Union-street, Birmingham, April 26, 1851

EXHIBITION, 1851.—HOME EVERYWHERE.
TENTS for the MILLION.

At BENJAMIN EDGINGTON'S Marquee, Tent, Flag, and Rick Cloth Manufactory, 2, Duke-street, Southwark. A Warehouse, 208, Piccadilly.

The following Second-hand Marquees to be sold reasonably—250 feet by 28, 180 feet by 40, 120 feet by 33, and 150 feet by 20. Emigrants' Tents fitted up complete.

A number of Second-hand Rick Cloths in good condition, with poles, &c., complete.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Sheddings, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

FOR PORT LYTTELTON, CANTERBURY SETTLEMENT, with liberty to land passengers and goods at the under-mentioned Ports in New Zealand, the first-class Passenger Ships, LADY NUGENT, 668 tons Register, for Canterbury, Nelson, and New Plymouth, to sail on the 28th of May; DUKE OF PORTLAND, 533 tons Register, for Canterbury, Wellington, and Auckland, to sail on the 28th of May, lying in the East India Docks, chartered and provisioned by the Canterbury Association.

Rates of Passage:—Chief Cabin, a whole Cabin between decks, 42*l.*; Second Cabin, 25*l.*; Steerage, 16*l.*; Children under 14, one-half. Each ship carries an experienced Surgeon.—For Freight, Passage, or further information, apply to J. STAYNER, 110, Fenchurch-street; FILBY and Co., 157, Fenchurch-street; or to FREDERICK YOUNG, Manager of Shipping for the Canterbury Association, 74, Cornhill.

EMIGRATION TO CANTERBURY, IN NEW ZEALAND.—A LIMITED NUMBER OF ASSISTED PASSAGES in the Steerage of the first-class ships DOMINION, 584 tons Register, and BANGALORE, 877 tons Register, to sail from London on the 8th and 28th of May, will be granted to persons of the Working Classes, being Gardeners, Shepherds, Farm Servants, Labourers, and Country Mechanics, for which application should be made at the Emigration Office of the Canterbury Association, 9, Adelphi-terrace, Strand, London. By order of the Committee of Management,

H. F. ALSTON, Secretary.

TOOTHACHE PREVENTED by using BRANDE'S ENAMEL for filling decaying Teeth, and rendering them sound and painless. Price 1*s.* Enough for several Teeth. The only substance approved by the medical faculty, as being unattended with pain or danger, and the good effects of which are permanent.

Sold by all Chemists in the United Kingdom. Twenty really authorised Testimonials accompany each box, with full directions for use. Sent free by return of post by J. WILLIS, 59 Fleet-street, London, in return for thirteen penny stamps.

CAUTION.—The great success of this preparation has induced numerous unskilful persons to produce spurious imitations, and to copy BRANDE'S ENAMEL advertisements. It is needful, therefore, to guard against such impositions, by seeing that the name of JOHN WILLIS accompanies each packet.

# READ'S PATENT GARDEN ENGINES, MACHINES, AND SYRINGES.

R. READ begs to inform Ladies, Amateur and Practical Gardeners, and the Public generally, that he has made considerable improvements in his ENGINES, MACHINES, and SYRINGES, by which Water may be dispersed in various densities, from a POWERFUL STREAM to a gentle Shower or Dewfall, and may be applied on the choicest Fruit Trees, Vines, Pines, &c., &c., without the slightest danger of injury. An improved ANGLE BRANCH may be applied to the Syringe for cleansing the UNDER surface of the leaves of Plants, &c., &c. (see Engraving). Manufactured only by

RICHARD READ,

INSTRUMENT MAKER (BY SPECIAL APPOINTMENT) TO HER MAJESTY,

35, REGENT CIRCUS, PICCADILLY, LONDON.

☞ CAUTION.—As Instruments of the commonest description are extensively circulated throughout the Kingdom, and sold as *Read's*, please observe that none are genuine except stamped with the Royal Arms and "READ'S PATENT."

London: LONGMAN, BROWN, GREEN, and LONGMANS.

PROFESSOR SCHLEIDEN'S BOTANY.

Just published, in 8vo, with Plates and Woodcuts, price 21*s.*

PRINCIPLES OF SCIENTIFIC BOTANY; or, BOTANY as an INDUCTIVE SCIENCE. By Dr. M. J. SCHLEIDEN, Extraordinary Professor of Botany in the University of Jena. Translated by EDWIN LANKESTER, M.D., F.R.S., F.L.S., Lecturer on Botany at the St. George's School of Medicine, London.

"More might be said in favour of this remarkable work,—valuable on account not so much of the vast accumulation of facts contained in it, as of the comprehensive manner in which they are strung together. The explanatory comments aid materially to render the text intelligible.... The author is greatly indebted to Dr. Lankester for the skill with which he has made his labours known in this country,—an especially for the ease with which the botanical terms are made conformable to our habitual technicalities in the science."—*Athenæum.*

London: LONGMAN, BROWN, GREEN, and LONGMANS.

NATIONAL FLORICULTURAL SOCIETY, 21, REGENT-STREET, LONDON.

NOTICE TO EXHIBITORS.—Mr. H. Groom, Clapham; Mr. C. P. Lochner, Paddington; Mr. H. Neville, Peckham; Mr. R. Stains, New Road; Mr. W. Barnes, Ware; Mr. T. Moore, Chelsea; Mr. F. R. Kinghorn, Twickenham; Mr. Appleby, Edgeware-road; Mr. W. Cock, Chiswick; Mr. W. Holmes, Hackney; Mr. Robinson, Pimlico; Mr. J. Davidson, Peckham; Mr. Parsons, Ponders End; Mr. Paul, Cheshunt; and Mr. J. Frazer, Lea-bridge, are the Censors specially appointed for the examination of Seedlings at the Society's Offices, 21, Regent-street, on Thursday next, the 8th inst., at One o'clock precisely, and all Plants, Flowers, &c., must be entered, labelled, and staged by that time. A ballot will take place for 28 new members. The nomination of Candidates will be proceeded with; the awards and certificates of the last exhibition announced, and subscriptions received.

By order, JOHN EDWARDS, Hon. Sec.

The rooms will be thrown open to members and their friends, by members' privilege tickets, at 3 o'clock, when the Chair will be taken, and the awards announced.

MONSTER NATIONAL FLORAL EXHIBITION, to be held in Cheltenham, on THURSDAY, JUNE 19, 200*l.* in prizes, and open to all England. Full particulars in the schedules, which will be forwarded on application, by post, to HAMLET W. MILLETT, Esq., Regent-street, Cheltenham. No entrance fee charged to exhibitors.

TUNBRIDGE WELLS.

A GRAND HORTICULTURAL FETE, under the distinguished patronage of H. R. H. the DUCHESS OF KENT, the EARL OF ABERGAVENNY, and the Nobility and Gentry of the neighbourhood, will take place in Calverley Park, Tunbridge Wells, on FRIDAY, the 27th of JUNE, 1851. Two Military Bands will be in attendance. Parties intending to Exhibit are requested to communicate with the Secretary, Parade, Tunbridge Wells, previous to the 10th of June, in order that the requisite space may be secured to them.

May 3. ISAAC CLIFFORD, Hon. Sec.

WARRANTED UNEQUALLED.

ROBERT WHIBLEY is now supplying Selections in Pots, and by Post, from his select Collection of FUCHSIAS. Twelve Varieties, new and distinct, of last year, 10*s.* 6*d.* cash. See List containing a great variety of choice new plants for one stamp.—Nursery, Kennington, London.

HOTHOUSE GRAPES may be obtained at a very moderate price.—Address W. CROUSAZ, Guernsey.

CALCEOLARIA "SULTAN."—This very desirable and shrubby CALCEOLARIA for bedding is now on sale, at 5*s.* each, or two guineas per dozen; habit dwarf, with large dark flowers; it is very hardy, and peculiarly adapted for the flower garden, throwing up a constant succession of its rich ruby-coloured trusses of bloom throughout the season.

Though of a different colour, it is equal for bedding purposes to the well known Calceolaria Kentish Hero, sent out five years since.

JOHN ANDREW HENDERSON and Co., Pine-apple-place, Edgware-road, London.

DAHLIAS.—The largest Stock in the Kingdom, of the finest kinds, both Fancies and other varieties. CHARLES TURNER can supply the above at 12*s.*, 18*s.*, and 30*s.* per dozen, fine constant kinds, and good plants, the selection left to C. TURNER. A list of those not desired should be forwarded with the order. Parcels paid to London, and plants given over to compensate for any additional expense.

A TREATISE ON THE CULTURE OF THE DAHLIA will be presented with each order.

Royal Nursery, Slough.

DAHLIAS.—MR. GEORGE GLENNY says, "Yours is the *very best* Dahlia out; 2000 plants would be sold if kept back and exhibited this year;" also, "it would be fooled away to let it out now." This, however, is unavoidable. The bloom is absolute perfection, and perfectly constant; named by Mr. Glenny, Morgan's King of the Dahlias, and pronounced by him "best of all the crimsons," and "best of all the Dahlias." Height, 4 feet. Plants first week in May, 10*s.* 6*d.* each. The usual allowance to the trade, where a dozen are ordered.—Unknown correspondents are requested to remit to ABRAHAM MORGAN, Cross-street, Oswestry, Shropshire.

BEAUTIFUL NEW LOBELIA, SYMONS'S "AURORA."—This fine Lobelia was raised by C. Symons, Esq., of Lyme Regis, Dorset, who is justly famous for his success in hybridising, and the cultivation of Lobelias. It is a fine deep mulberry crimson, of good habit, with long panicles of bloom, a robust and hardy grower. It is distinct from all others, and will be found a great acquisition.

Messrs. VEITCH and SON can now supply established plants at 5*s.* each, or to the trade, six for 21*s.*—Exeter, May 3.

JNO. HENCHMAN begs to inform the Trade and Furnishers that his choice Collection of above 4000 CALCEOLARIAS is now coming into full bloom; price per 100, 3*l.* 5*s.* Amateurs may furnish themselves with choice varieties at 1*s.* each.

A large stock of Cinerarias and Genista fragrans at equally low prices.—Edmonton, May 3.

STRAWBERRY BEDS.—To those Ladies and Gentlemen who have changed their residence since the 25th of March, or not having an opportunity of forming beds to bear this season, EDWARD TILEY begs to inform them they may yet do so, he having a large stock of Strawberries grown in pots for the purpose of late planting; they are well set with bloom, such as will insure fruit this year, and double the quantity over those planted in the autumn for the next season. They consist of the following first-rate varieties: Kitley's Goliah, Elton Pine, Alice Maud, Cole's Prolific, and British Queens. Any of which can be forwarded at 4*s.* 6*d.* per dozen, hamper and package included. A remittance must accompany the order, either in cash or penny postage stamps.—EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath.

VERBENAS, SCARLET GERANIUMS, PETUNIAS, DAHLIAS, FUCHSIAS, CHRYSANTHEMUMS, and all the popular varieties of Bedding Plants.

*Many thousands of the most showy and favourite Bedding Plants are now ready for sending out, strong and cheap. Persons preparing to plant are recommended to peruse our Priced Descriptive Spring Catalogue, stamped as a Newspaper, to go free by post, and supplied gratis.*

For HARDY PLANTS, consisting of Antirrhinums, Phlox, Pentstemons, Lobelias, Potentillas, Rock, and other Herbaceous Plants, select Flowering Shrubs, Roses, Climbing Plants, &c. &c., see our Autumn Catalogue, supplied gratis.

BASS and BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

CALENDRINIA UMBELLATA, a brilliant and beautiful hardy perennial, 1s. per paper.

The above may be had of Messrs. JEYES and Co., Nurserymen, Northampton.

Payment can be made with postage stamps.

---

A MOST DESIRABLE OPPORTUNITY IS NOW OFFERED TO THOSE ABOUT DECORATING "THE FLOWER GARDEN."

By inspecting YOUELL AND CO.'S New and Descriptive Price List for the present season. It contains all the new as well as the most ornamental plants for bedding, with colours attached. Also a descriptive list of the best Verbenas, Fuchsias, Fancy and Scarlet Geraniums, Pansies, Heliotropes, new Liliputian and large flowering Chrysanthemums, Antirrhinums, Hollyhocks, Camellias, Cinerarias, Gloxinias, as well as a select collection of Stove and Greenhouse Plants.

Catalogues will be forwarded on receipt of two postage stamps.

Owing to the numerous letters of inquiry respecting their new and magnificent Gloxinia "Petoiana," they take the present opportunity of announcing that it will not be ready for sending out until June next., of which due notice will be given.

YOUELL and Co., Royal Nursery, Great Yarmouth.

---

THE FLOWER OF THE DAY—VARIEGATED SCARLET GERANIUM.—This elegant plant is of vigorous habit, the foliage bright green, with a broad silver margin. The flowers light scarlet, in large trusses, like Globe Compactum. JOHN and CHARLES LEE are selling extra strong plants, at 10s. 6d. each. Small plants for bedding on the 1st of June, 60s. per dozen.—Nursery and Seed Establishment, Hammersmith, near London.

---

WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WM. WOOD AND SON beg to offer choice collections of the following plants:—

| Fuchsias | 6 0 | „ 12 0 |
| Hollyhocks, fine sorts, unnamed | | 6 0 |
| Anemone japonica | | 6 0 |
| Escallonia macrantha | each | 3 6 |
| Lycopodium cœsium arboreum | „ | 3 6 |

Extra plants presented to compensate for carriage.

Rose Nippers from 2s. 6d. to 4s. per pair; Metallic Labels for pot Roses 2s. per 100; Scotch prepared Tobacco Paper, highly recommended as the best sort for all horticultural purposes, 2s. per lb.

---

VALUABLE VEGETABLES.—CAULIFLOWERS.—Myatt's improved early, much earlier than the old varieties, more compact and heavier, considered by the raiser as most desirable, quantity very limited; 1s. packets.

BRUSSELS SPROUTS, improved variety, direct from Brussels; 1s. per oz, 6d. per packet.

CABBAGE, MITCHELL'S ENFIELD.—This has been tried at the Horticultural Society's Garden, and pronounced one of the best; 1s. per oz, 6d. per packet.

CABBAGE, CHAPPEL'S COLEWORT, excellent for Winter Greens, 6d. per oz.

CARROT, ST. JAMES', one of the best for small gardens, and shallow or heavy soils; 3d. per oz.

CELERY, COLES' SUPERB RED, very extensively grown last season, and pronounced first-rate; 1s. per oz., 6d. per packet.

LETTUCE, VICTORIA CABBAGE, but little known, but one of the handsomest grown, and which no gentleman's garden should be without.

DUNCAN HAIRS, in offering the above selection from his general List, begs to inform his friends that he warrants them to be as described.

109, St. Martin's-lane, Charing Cross, London.

---

NEW CONTINENTAL VERBENAS.

THOMAS BARNES begs to inform the admirers of the VERBENA that he has a fine healthy stock of the following, which he can supply at the reduced price of 2s. 6d. each, or 24s. the set, viz.—André, Alfred, Augusta, Dorothée, Eloïte de Beyer, Esteve, Jules, Gen. Brea, Mdlle. Gardie, Madame J. Henderson, Montoni, Ne Plus Ultra, and Marianne. With a large collection of the best in cultivation, from 4s. to 12s. per doz.

Catalogues may be had on application.

Danecroft Nurseries, Stowmarket, May 3.

---

| Jullien | FANCIES. |
| Lady E. Cathcart | Kingfisher |
| Leda | Miss Weyland |
| Model | Mrs. Hansard |
| Mr. Palmer | Mrs. Willis |
| Napoleon | Nonsuch |
| Nepaulese Prince | Pretty Polly |

C. TURNER can supply plants of other raisers' new varieties.

Royal Nursery, Slough.

---

FORGET-ME-NOT.

MYOSOTIS AZUREA GRANDIFLORA.—This unique variety stands unrivalled for its colour and habit, being very superior to the older sorts of that lovely flower, the Forget-me-not; it also possesses the following good qualities over them: The flowers are much larger, perfectly hardy, and will stand for many years in the same situation; it is a lively blue, and grows about 9 inches high, producing hundreds of blooms on the plant at a time; flowering from June till October, it will be found very useful for planting on rockwork, making a bed, or forming edgings; being a colour much wished for, as there is a great deficiency of dwarf blue flowers for autumn blooming. The Seed of the above is now ready to be sent out, at 2s. 6d. per packet. Also the following varieties of Flower Seeds can still be had: Hollyhock Seed, 2s. 6d. per packet of 150 seeds; German Aster Seed, 1s. per packet; Sweet-William Seed, 1s. per packet; Antirrhinum Seed, 1s. per packet; and also the other varieties of Seeds named in the former Advertisement in this Paper on the 5th of April. The whole or any part of the above sent postage and package free. A remittance must accompany the order, either in cash or penny postage stamps, for the amount.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath.

---

FINE NEW HYBRID STATICE, "STATICE HALFORDII."

MESSRS. VEITCH AND SON have much pleasure in offering this beautiful hybrid Statice, which was raised by Mr. Blackmore, gardener to Mrs. Halford, of Newcourt, near Exeter, from the seed of S. macrophylla crossed with S. frutescens. The plant is of fine habit, intermediate between its two parents. It is a most abundant bloomer and altogether a very great acquisition to this lovely tribe of plants. It is named in compliment to the lady in whose beautiful gardens it was raised.

Well-established Seedling Plants ... ... 5s. each.
Do. Do., to the Trade, 42s. per doz.

N.B.—A few fine strong Plants of the new STATICE MACROPHYLLA, in 32-sized pots, 7s. 6d. each.—Exeter, May 3.

---

STORY'S SUPERB SEEDLING FUCHSIAS.—FUCHSIA PRINCE ARTHUR (STORY'S).—This is the finest of all the double corolla flowers yet raised and offered by Mr. Story. The corolla is of intense purple and well formed; the tube and sepals are a fine scarlet, smooth and without excrescence, the sepals being sufficiently reflexed to show the corolla to advantage. It is a free bloomer, of good habit and a great novelty. Strong plants, 10s. 6d.

FUCHSIA ATTRACTION (STORY'S).—This is a very attractive flower, of extra large size and brilliant colours. The tube and sepals are vermilion, the corolla a fine purple, and rendered very conspicuous by the sepals reflexing. A free-flowering and saleable variety. Strong plants, 7s. 6d.

FUCHSIA DEVONIENSIS (STORY'S).—This is a fine variety, of excellent habit, with a short scarlet tube, and sepals of fine texture; corolla beautiful, light violet, and well formed. It is an abundant bloomer, and will be an acquisition to every collection. Strong plants, 7s. 6d.

The set of three, taken together, package included, for 21s., for cash (prepayment). The usual discount to the Trade.

Messrs. VEITCH and SON have much pleasure in offering the above beautiful Fuchsias. They are seedlings raised in 1849, and proved in 1850 by W. H. Story, Esq., of Whitehill, Newton Bushell, and were selected from a vast number of seedlings. They are all perfectly distinct, and worthy of general cultivation. Mr. Story's well-known character as a raiser of seedlings will be a sufficient guarantee that he would permit nothing to be sent out, with his name attached, that was not of first-rate character, and calculated to give satisfaction.

N.B.—A remittance or reference from unknown correspondents required; this will be strictly adhered to.

Exeter, May 3.

EXPL.—*The above selections comprise the finest varieties; those marked f. require protection in winter; g. greenhouse plants; h. h. half-hardy annuals; they succeed best sown on a hot-bed, but will do without artificial heat at this season. Mixed packets may be had of all the above sorts, from Aster to Wallflower, at 6d. each; also of the following:—Acacia, 20 sp. g., 1s.; Achimenes, g., 1s.; Anemone, 6d.; Bellis perennis, 40 vars., 1s.; Calceolaria, new spotted, g., 1s.; Cineraria, g., 1s.; Doryanthes excelsa, Gigantic Australian Lily, 1s.; Elichrysum, g., 1s.; Nemophila maculata, beautiful for greenhouse, 6d.; Pansy or Heartsease, 1s.; Primula sinensis, mixed, 1s.; Saponaria calabrica, 6d.* All the above seeds sent prepaid at the prices affixed.

JAMES CARTER, Seedsman and Florist, 238, High Holborn, London.

---

SUTTON'S SELECTED TURNIP SEEDS AND NATURAL GRASSES.

PERMANENT PASTURE GRASSES,

*Mixed expressly to suit the soil for which they are required, at the reduced prices of 22s. 6d. to 28s. per acre.*

SUTTON'S RENOVATING MIXTURE, consisting of Perennial Clovers and fine Grasses, for improving old Parks, Meadows, and Upland Pastures, 10d. per pound.

Ashcroft Swedes; Skirving's Liverpool Swede Seed; Sutton's fine sort of purple-topped Swede; Sutton's purple-topped Yellow Hybrid Turnip; the New Lincolnshire Red Globe Turnip; Sutton's early six weeks Turnip; also, Yellow Globe and other Mangold Wurzel, of superior quality, at low prices, as per catalogue, which may be had gratis.

JOHN SUTTON and SONS *are exhibiting, in Class III., at the great Exhibition, their skinless Chevalier Barley, and their purple-topped Hybrid and Lincolnshire Red Turnips.*

*From a Clergyman, an eminent Agriculturist, and Member of the Royal Agricultural Society.*

"I have had the pleasure of praising your Seeds in many quarters beside that to which you refer. This I have done from a sense of justice only."

*Another Clergyman writes us—*

"My Turnip crops are the admiration of all the farmers round, especially the Swedes and your Purple-topped Hybrid. I hope you have some of the same kind this year, as I am certain the superiority in my crops is mainly owing to the stocks."

*The above are similar to hundreds of others.*

N.B.—Instructions for sowing accompany every parcel of Grass Seeds; and any other information required by post will be promptly given.

*Goods delivered free of carriage to any Office in London, Bristol, Gloucester, Exeter, Southampton, &c.*

Reading, Berks, May 3.

---

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND CO. beg to notice their mixtures of GRASS SEEDS for Laying Land down to Permanent Grass, are now ready for delivery. They have reduced the price to 30s. per acre, allowing 2 bushels 12 lbs. to the acre.

Mixed sorts for improving old Grass Land, 1s. 2d. per lb.

Fine sorts, for forming Lawns, 1s. 3d. per lb. Directions for sowing will accompany the Seeds.

GEORGE GIBBS and Co. will feel happy in sending general priced Catalogues of Agricultural and Garden Seeds, on application to 26, DOWN-STREET, Piccadilly, London.

TULIPS.

MR. DAVIDSON, Camden Grove, Peckham, will submit a portion of his BULBS for Sale, during the bloom, by private contract.—Applications for Catalogues (with a price to each row) will please address, free, inclosing a postage stamp.

HUGH LOW AND CO.'S NEW CATALOGUE OF PLANTS is just published, and will be sent free on prepaid application.—Clapton Nursery, London.

EXTENSIVE SALE OF PINE-APPLE PLANTS.

TO NOBLEMEN AND GENTLEMEN requiring PINE PLANTS, an excellent opportunity is offered for supplying themselves with clean healthy plants. The stock consists of several hundred fruiting and succession plants, of the following sorts:—Providence, Black Jamaica, Black Antigua, Montserrat, Elville, Globe, Queens, Ripley Queen, Antigua Queen, Moscow Queen, St. Vincent, Blood, smooth and prickly Cayenne, Trinidad.—For particulars apply to J. and C. LEE, Nursery, Hammersmith; to Mr. MARNOCK, Royal Botanic Gardens, Regent's Park; or to Mr. MOFFATT, Chamber Gardens, Worksop, Notts.

DAHLIAS.

JOHN KEYNES, FLORIST, Salisbury, will be prepared with extra strong plants ready to send out the 1st of May, 1851, of the following New and First class DAHLIAS:—

| | |
|---|---|
| Yellow Superb. | Baltic. |
| Hon. Mr. Herbert. | Antoinette. |
| Beauty of Kent. | Miss Pope. |
| Summit of Perfection. | One-in-the-Ring. |
| Nepaulese Chief. | Miss Herbert. |

The whole stock of these are in the possession of JOHN KEYNES, and Prizes for the best Six Blooms from the above will be given at three of the leading Exhibition of the season. Orders for Dahlias from other growers faithfully executed in conjunction with his own.—Salisbury, May 3.

FIFTY-FOLD KIDNEY POTATO.

JAMES LAKE, NURSERYMAN, &c., Bridgewater, Somerset, begs to inform the public that he is now sending out his Seedling Fifty-fold Kidney Potato, six tubers of which were sent to Dr. Lindley, April 29th, 1850, and produced 312, quality very good; six tubers also sent to Beck, Henderson, and Co., at the same time, produced 580, although grown in poor ground. Price 4s. per peck.—London Agents: HURST and M'MULLEN, 6, Leadenhall-street.

J. L. having grown from 15 to 20 lights of Aban's Conqueror of the West CUCUMBER, successfully for three years, can with confidence recommend it to the public as being one of the best kinds in cultivation. Packets containing 12 seeds, 1s. each.

AZALEA INDICA "SYMMETRY" (KINGHORN.)—The celebrity this Flower has gained, and the eulogium that has been bestowed upon it, render it only necessary to mention the opinions of competent judges, the awards it has received, and simply to add that it is superior in shape and substance to any variety hitherto introduced, and equal in colour and habit to the most popular kinds. In May, 1850, a first class certificate was awarded to it by the London Floricultural Society, and it was thus described in the *Gardeners' and Farmers' Journal*. "Azalea indica Symmetry is a magnificently formed flower, of extraordinary substance; colour salmonish pink, varying to light scarlet, richly spotted in the throat with deep crimson; size large." At the June show, 1850, at Chiswick, it obtained the Silver Banksian Medal, and was recorded in the *Gardeners' Chronicle* as "a considerable improvement on Lateritia." JOHN and CHARLES LEE having purchased the stock of Symmetry, intend sending out healthy Plants on the 1st of June, price 21s. each.—Nursery and Seed Establishment, Hammersmith, near London.—May 3.

NEW DAHLIAS; E. FOSTER'S, Esq., CHOICE PELARGONIUMS; PICOTEES, CARNATIONS, HOLLYHOCKS, PANSIES, &c.

WILLIAM BRAGG, Star Nursery, Slough, begs to say his Catalogue of the above Flowers is now ready, and can be had on application. His choice SEEDLING DAHLIAS will be sent out the first week in May at 10s. 6d. each, viz.:—

ADMIRAL, rich lilac, very constant, gained first Seedling prize, 25s., at the Royal South London Exhibition; 21s. Shacklewell Open Shows, &c., fourteen first class certificates; the most successful flower of the year.

CARMINA, rich carmine, constant show flower, gained six first class certificates, &c., shown in several winning stands.

The Hon. Mrs. ASHLEY, waxy white, tipped with rose, splendid show flower, &c. W. B. thinks it the best Dahlia of the season; was awarded by Dr. LINDLEY a certificate of merit at the Horticultural Society, &c. Gained five first class certificates.

QUEEN OF FAIRIES, Domeyer. W. BRAGG has purchased the stock of this fine and constant fancy Dahlia, from the above amateur, who will give 5l. in prizes the next season for this flower. It gained a Seedling prize and first-class certificate, with Edwards's Mrs. HANSARD; at the Royal South London Open Show Exhibition five first class certificates.

W. B.'s stock of Picotees, Carnations, and Pinks are strong and good; the best Hollyhock Seed ever sent out can be had in 2s. 6d. and 5s. packets, post paid, for prepayment.

BATH NURSERY.

JAMES GRIFFIN begs to announce that his Annual Spring CATALOGUE is now ready, and may be had on application. It contains a Descriptive List of all the newest and best Dahlias, Fuchsias, Verbenas, Phloxes, &c.; also a Select List of the most useful plants adapted for decorating the Flower Garden. The prices will be found exceedingly low. Weston-road, Bath.

**The Gardeners' Chronicle.**

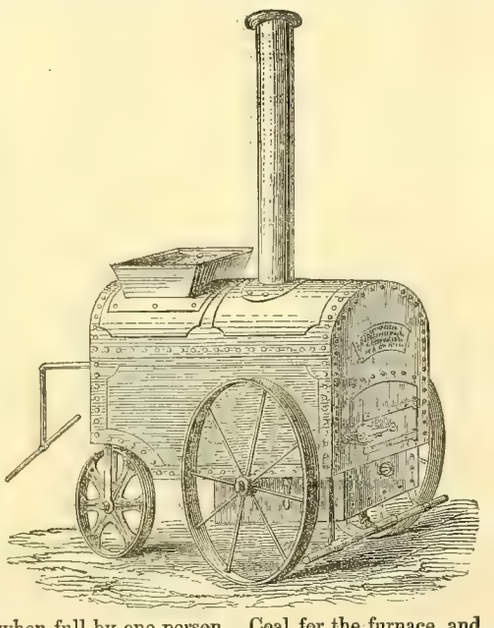
COUNTRY SHOWS.—Wednesday, May 7: Hammersmith Pansy.—Thursday, May 8: Cheltenham Horticultural and Floral.



AT length the Crystal Palace is accessible to all the world. The anticipations of its friends are more than realised; the predictions of its enemies and slanderers are more than falsified. Few men ever saw, on English ground, a scene like that of Thursday, when Her Gracious MAJESTY declared the EXHIBITION TO BE OPENED; none have seen, here or elsewhere, such an assemblage of the results of human industry as the vast building now contains. To the general press belongs the task of chronicling the endless examples of human ingenuity brought from all corners of the globe; our charge is far more humble. The raw materials with which the cultivator has to deal; or the instruments contrived to aid him in this task, form the greater part of what our readers will expect in the *Gardeners' Chronicle* and *Agricultural Gazette*. Grain, timber, textile plants, and other vegetable products, animal substances, and animal preparations, implements of husbandry, and the decorations which good taste and bad taste have contributed, in the form of vases, glass work, fountains, and the like, will amply fill such space as our columns may afford from time to time. For to-day, we limit ourselves to an account of Mr. FLEMING'S contrivance for distributing boiling salt and water over ground walks; and to an account of some singular timber, sent from Van Diemen's Land, by Sir WILLIAM DENISON.

ABOUT six years ago the extensive improvements in the grounds at Trentham were brought to a state of completion; and the walks, many of which had been made at great cost, and for which gravel that was reported to prevent the growth of weeds had been brought a considerable distance, were already becoming covered with a thick carpet of Moss, which rendered them not only unsightly, but in damp weather very slippery and dangerous to walk upon. Weeds, too, came up in millions, and much anxiety was caused by this unexpected state of things. To turn the gravel, as is usually done, was objectionable on account of the cost, and the operation would only temporarily remove the Moss and weeds; while the walks, which were perfect as regards form and solidity, would be rendered for a time unfit for use. Hand-picking had been going on for three years, at an annual cost of from 80*l.* to 100*l.*, but only the larger weeds could then be kept down, and the Moss was still extending. Things were in that desperate state which gardeners often find it difficult to get out of, when the idea occurred to Mr. FLEMING that a hot solution of water and common salt would destroy the Moss and weeds, and thus save the expense of turning so vast an extent of gravel. Accordingly in April 1849 he set to work in earnest, determined to extirpate the evil in a wholesale manner. An ironmonger in the neighbourhood was applied to to make a boiler, with furnace, chimney, valve, &c., and to move upon wheels as shown in the cut; the object being to scald the weeds with water boiled on the spot, and to poison the surface of the walks with salt in a state of solution with the hot water, and so to destroy the present crop of weeds, and prevent any more from growing for at least six or eight months to come. All things being ready, the walks perfectly dry and close, and smooth by rolling, the apparatus was set to work. A boy filled it with water, lighted the fire, and put two pounds of salt to every gallon of water. In three quarters of an hour the water was boiling, and a man working not many yards off was applied to, to pull the machine along, which was more than the boy could do, but it was easily managed by the two. At the moment of moving the machine, the valve is opened and the boiling hot solution is dispersed over a certain breadth of the walk, and everything upon it having life is destroyed. At each time about 30 gallons of the liquid are applied to the walk, which is a sufficient quantity to go over from 80 to 85 square yards. After the apparatus is heated, the water may be made to boil in about 20 minutes.

When the gravel is firm and smooth, so as not to let the solution pass too quickly through, it leaves when dry a distinct crust of salt upon the surface, that lasts a fortnight or three weeks in dry warm weather; and when this is the case, the operation has to a certainty been successful; for however well the Moss may be established, it will turn black, and curl up in flakes towards the sun, and will be washed by heavy rain to the sides of the walk, where it may easily be swept up; and in three months the gravel will look as though it had been scoured with soap and a brush. The weeds may be so numerous as to form a turf, and their fate will be that of the Moss, except that their roots being deeper in the gravel, are not so soon washed away by rain; but this is of little consequence, as their bleached and withered leaves are after a few weeks scarcely visible. As soon as the walks will bear it, the roller should be passed over them, in order to solidify the surface, and to prevent the escape so readily of the saline poison during rain; the great point being to make one application effectual, in destroying not only existing weeds and Moss, but also seeds of weeds already in the gravel, or that may be blown upon it.

Mr. FLEMING'S first trial happened to be made during hot weather, and so thoroughly was the work done, with the assistance of the sun's heat and continued dry weather, that walks which looked black and green with the different kinds of Moss, from the windows of the mansion in April, became beautifully clean by June, and they required to have nothing more done to them until May last year, when a few luxuriant plants of Dandelion and Poa annua intimated that a repetition of the previous year's process would be the means of preventing further labour for at least another year. At the present moment, there is not a weed to be seen on these walks; but as a preventive is better than cure, it is intended, if the weather be suitable, to go over them again next month.

The only thing that requires to be guarded against is, that the Grass or Box edgings are not killed by the boiling salt water coming in contact with them. At Trentham, the machine is kept far enough off them, and whatever weeds are missed along the side of the edgings, are soon removed by hand. A small ridge of sand might be laid along the edges to keep off the water; and this could soon be swept up and used again further on. The apparatus which Mr. FLEMING had first made was too heavy; but it has since been much improved upon, and the one which has been sent to the Great Exhibition can be moved

when full by one person. Coal for the furnace, and salt, is conveyed along in a barrow, and water is brought in a water-barrow, ready for filling up the apparatus when required. One person can bring water, move along the barrow with the salt, and have time to pick some of the weeds from the edges, while the water is boiling, and thus no time is lost. The surface of gravel cleaned in this way in one day is about a quarter of an acre; and if this space was very foul, and had to be hand-weeded, it would cost from ten to twelve shillings each time, or from 2*l.* to 3*l.* annually, while with the apparatus it will cost only six shillings. As the action of the salt causes rapid corrosion, care is taken to have the machine thoroughly cleaned and painted, and the valve well oiled before it is put by for the season.

A drive, court-yard, or walk, may be green with moss and weeds, but the expence of cleaning by these means will not be increased; and it will keep clean much longer than by any other method. One of the greatest advantages is that when a walk is once well made (which all walks to be comfortable should be), it need never be disturbed by weeding-irons, turning, or, as in Scotland, by hoeing and raking. Where walks are not smooth and comfortable, the gardener has seldom much peace until he has rendered them so; and all the plans which we have hitherto seen for destroying weeds are not merely expensive but only partially successful.

## BRITISH SONG BIRDS.

(CAGE BIRDS, No. 12.)

No. XXVIII.—Turn we now, for a short season, and with the kindest of motives, from our good little friends the *seed*-birds, to give a thrice hearty welcome to their amiable summer associates. I mean those sleek, trim, lovely, lively, delicate "Warblers," whose advent here, at this season, is so anxiously looked for by their expectant admirers; and some one of whom is now arriving, daily, to take up his summer quarters on our hospitable shores.

Who would think, to look at that tiny little whitethroat, and that glossy black-cap, that only a few days since both were braving the elements at sea, and winging their flight across the troubled waters of the Mediterranean? Yet such is the fact. From Africa do they start; and little repose do they know, until they reach England. I am, I believe, about the first, in our parts,

to hear of the landing of any of these our visitors. Knowing the time they are "due," I daily keep a close look-out; and, as I walk abroad, I am not slow to herald their approach:

"Some well-known voice salutes *my* ear,"

when others are strangers to its sound.

The last week has been productive of many interesting "arrivals." I have, already, recognised a variety of harmonious foreign voices, and seen whence they have proceeded.* Perched among the overhanging branches of trees, and half-secreted amongst shrubs—there sat the choristers in the full enjoyment of their native liberty; giving utterance to their feelings in gushes of exuberant joy. Nor are these little fellows soon disquieted. They seem instinctively to know that they are "welcome;" and unsuspectingly do they keep on singing, as if anxious to claim an acquaintanceship with the passing traveller. Hard-hearted monster must he be, who seeks to destroy such pure enjoyment, and such innocent mirth! And yet, this very instant, lieth he in wait to ensnare his unsuspecting victim! See, he is lurking beyond yon hedge! I shall have a word or two to say about him, anon. But to return.

Even now, while I write, with my casement open, I am listening to the hero of this day's article—the Nightingale. Ravenscourt Park, which impinges immediately on my flower-garden, is ringing with his song; though the stars alone are shining, and the waning moon is not yet visible. I can hear many responsive echoes through the neighbouring trees, which tell me we shall have a treat this season.

That magic strain, now borne upon the breeze, comes from the lover's mate. She has been drinking in large draughts of her swain's passionate avowals of constant love and affection, and is now returning him the most impassioned and pathetic outpourings of a grateful and fond heart. Every note she breathes is redolent of sincerity, ardour, fervency, and adoration. All are unmistakeable tokens of the depth of her attachment. Sweet Philomel! How worthy art thou of being loved; and what a pattern of virtue dost thou not hold out for imitation! I could sing thy praises until doomsday.

From this time forward our hedgerows, coppices, brakes, fields, gardens, lanes, and shrubberies, will be heard to echo with the choicest melody,—not the melody of the new comers *only*, but a grand chorus from a union of voices, native as well as foreign. The thrush, the blackbird, the woodlark, and the robin,—all love to commingle their notes with those of the "warblers." No discord have we here—all is "concerted" music.

How pleasant is it, in this festive, "merrie" month, to rise with the early lark, and listen to the music of the grove! From 4 A.M., until half-past 4, the birds are at full "Matins." Have my readers ever attended any of these performances? If not, let such of them as reside in the country make a single trial. If they be lovers of Nature, and also lovers of the feathered choir, how they will thank me for my suggestion!

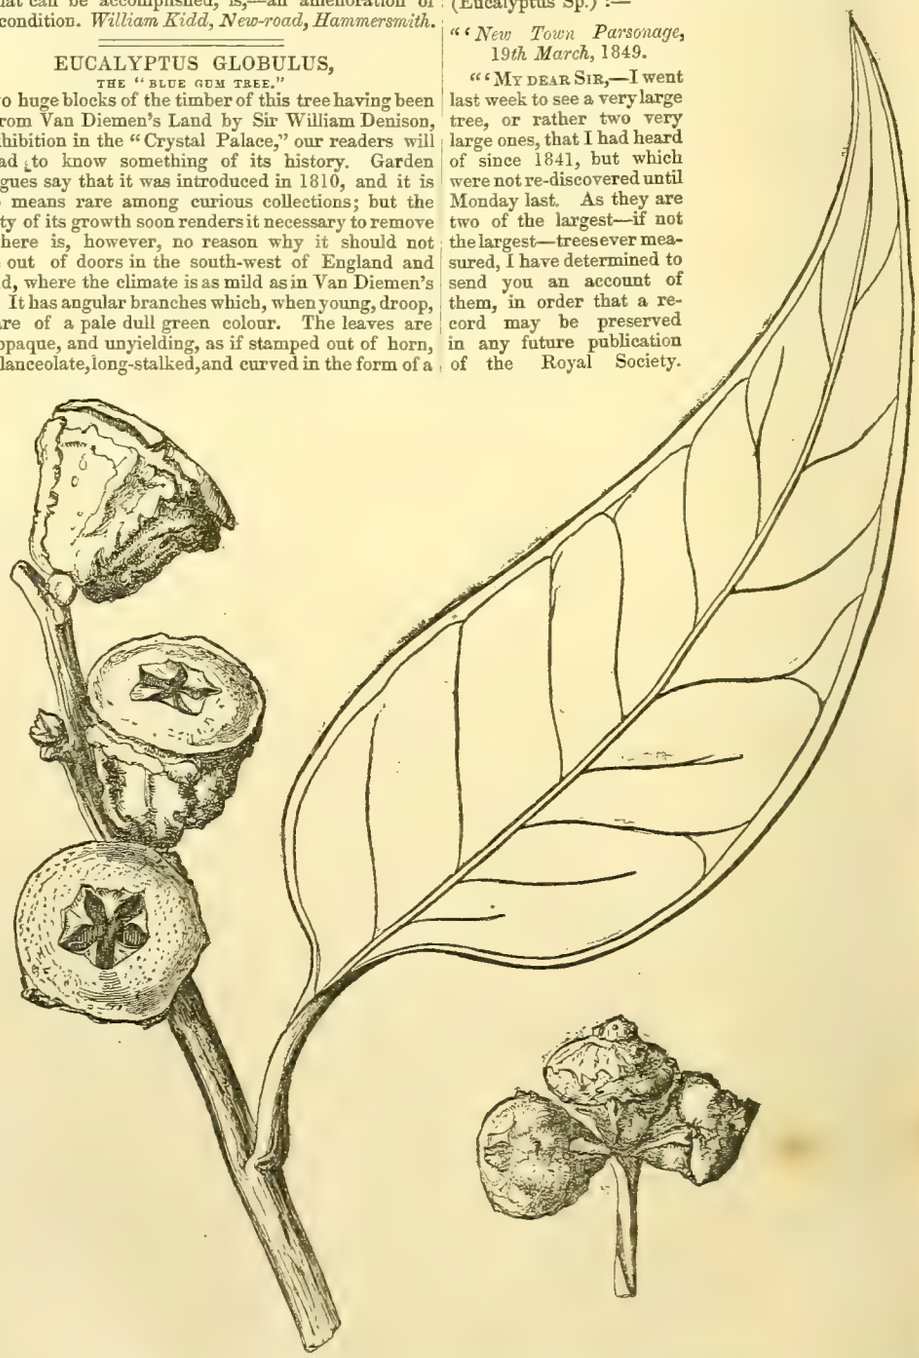
Then, again—how delightful to wander out at eventide by the side of a rivulet or running brook,—or to saunter through a mead, a meadow, or a secluded lane! The birds may then be heard chanting their choral "Vespers." Many such happy walks have fallen to my happy lot, in days gone by; and as my love for such enjoyment seems to gain strength by time, let me hope the day is far distant when I shall seek pleasure in more hurtful pursuits. But a truce to reflection. We will now at once plunge *in medias res*.

The Nightingale is looked for about the 14th of April; and he is generally here to his time—he was *this* year—unless violent gusts of wind prevail, and so prevent him breasting the Channel. It is worthy of note, that the males always arrive some 10 days *before* the females. Hence, all that are trapped early, are sure to prove "birds of song," though, of course, not all equally inspired with the true *poetry* of song; for with these birds, as with us,—Poeta *nascitur, non fit*.

Nightingales are, of all birds, the most easy to be snared. The villainous bird-catchers, in whose callous breasts pity was never yet found, know this well; and remarking, with the astute cunning of a fox, where the finest birds are located, they lie in wait all night for their prey. At early dawn, they set to work and turn up some mould. The innocent birds at once unsuspectingly descend to seek for a worm in the fresh earth, and seeing the bait (a lively mealworm) in the trap,—they greedily seize it, and find their liberty gone for ever! In this manner are the tribe caught by dozens.

The birds, when secured, are placed in a store cage, and quickly conveyed to the bird dealers in the Seven Dials. These worthies then proceed at once to "meat them off." This is accomplished thus:—Some fresh, raw beef is scraped; and being divested of all fibrous substance, it is mixed into a soft paste, with cold water, and hard boiled yolk of egg. This is put into a large tin bird pan. In the middle of this food is placed a very small inverted liqueur glass, with the stem broken off. Under this glass are introduced three or four lively mealworms, whose oft repeated endeavours to break out of prison attract the attention of the nightingale. Not understanding *how* these worms are placed beyond his reach, he continues to peck at them, until by degrees he tastes the beef and egg, which is artfully rubbed over the sides of the glass. This being palateable, he satiates his appetite with it, and soon feels a zest for it—particularly as his attempts to get at the meal-worms always prove abortive. He now eats regularly—he is meated off.

When first imprisoned, the front of the cage is covered over with tissue paper, to prevent his majesty from being frightened by too great a glare of light. When he becomes reconciled, or rather, resigned to his fate—in a few days, perhaps—this covering is gradually removed, by tearing off small sections of the paper. He must then be suspended, not at too great a height, and be disturbed as little as possible. He will sing almost immediately; but do not imagine therefrom that he is "happy"—a bit of conceit on your part; pardonable, perhaps, but far from the fact. Torn, remorselessly torn, from all he holds dear in the world, dragged from his shady bowers, and pent up between walls of mahogany—there he sits, an object of real pity! His lovely voice is indeed heard—he is lovely even in his tears—but his soul is consuming away in the very bitterness of his spirit. His faith has been plighted long 'ere he reached our country, and he preceded his ladye-love only for the purpose of welcoming her on her arrival.



In the face of all these naked facts, we still persist, year by year, in making fresh prisoners. This being so, I shall perform the very pleasing duty of showing the best way to bring some good out of much evil. What the late worthy Mrs. Fry was to the prisoners in Newgate—*that* will *I* try to be to Nightingales in a cage. She could not indeed give *them* liberty; nor can I, *these*. All that can be accomplished, is,—an amelioration of their condition. *William Kidd, New-road, Hammersmith.*

* If any of my readers happen by good chance to be located within a reasonable walking distance of the Duke of Devonshire's grounds at Chiswick, let them pay a very early visit to this picturesque neighbourhood, and let them make a complete tour of the garden walls. In their walk, they will hear the voices of nearly every one of the "warblers." This is a very favourite spot of mine.

## EUCALYPTUS GLOBULUS,

THE "BLUE GUM TREE."

Two huge blocks of the timber of this tree having been sent from Van Diemen's Land by Sir William Denison, for exhibition in the "Crystal Palace," our readers will be glad to know something of its history. Garden catalogues say that it was introduced in 1810, and it is by no means rare among curious collections; but the rapidity of its growth soon renders it necessary to remove it. There is, however, no reason why it should not thrive out of doors in the south-west of England and Ireland, where the climate is as mild as in Van Diemen's Land. It has angular branches which, when young, droop, and are of a pale dull green colour. The leaves are firm, opaque, and unyielding, as if stamped out of horn, ovate-lanceolate, long-stalked, and curved in the form of a sickle; sometimes they are wider at the base on one side than on the other, and, by a twist of the stalk, always stand with their edges vertically instead of horizontally. The white flowers are almost two inches across when the stamens are expanded; and are produced singly or in clusters of threes; sometimes as in our figure, when the leaves fall off, the fruits seem as if in spikes. The calyx is singularly knobby and rugged, with an angular tube, and a cover shaped like a depressed cone, or like a convexity with a rude boss in the centre. These flowers are covered before expansion with a thick glaucous bloom. The fruits are hard, woody, angular, rugged, knobby, urn-shaped bodies, with five opening into the cavities of the capsule.

The early discoverers of this tree reported it to attain the height of 150 feet; but they were far within the truth, as is shown by the blocks in the Great Exhibition, one of which near the base is 5 feet 7 inches in diameter; and another, cut 134 feet above the first, is still 2 feet 10 inches in diameter. We learn from the proceedings of the Royal Society of Van Diemen's Land (vol. i., p. 157) that, on the 11th of October, 1848:

"A paper was read by Mr. H. Hull descriptive of a gigantic tree of the Gum tribe, 'occurring in a gorge on the declivity of the Mount Wellington range near Tolosa, about six miles from Hobart Town.' Mr. Hull describes it as a Blue Gum (Eucalyptus globulus), and says 'it stands close to one of the small rivulets that issue from the mountain, and is surrounded with dense forest and underwood. * * * It was measured with a tape, and found to be 28 yards in circumference at the ground (more than 9 yards in diameter), and 26 yards in circumference at the height of 6 feet. The tree appeared sound except at one part, where the bark had opened, and showed a line of decayed wood. The full height of the tree is estimated to be 330 feet.'"

It is not improbable that the following extract from the same work (p. 165) relates to the same species, although it is spoken of by another name:—

"Mr. Milligan read the following note from the Rev. T. J. Ewing, of New Town, on the occurrence of some unprecedentedly large specimens of the Swamp Gum (Eucalyptus Sp.):—

"'*New Town Parsonage, 19th March*, 1849.

"'My dear Sir,—I went last week to see a very large tree, or rather two very large ones, that I had heard of since 1841, but which were not re-discovered until Monday last. As they are two of the largest—if not the largest—trees ever measured, I have determined to send you an account of them, in order that a record may be preserved in any future publication of the Royal Society. They are within three quarters of a mile of each other, on a small stream, tributary to the north-west Bay River, pretty far up on the ridge which separates its waters from those of Brown's River. They are easily reached from the Huon foot-path, and are in a beautiful vale of Sassafras and Tree-Ferns, and not in an inaccessible gully, like most of our gigantic trees. I have never before seen the Tree-Ferns growing in such luxuriance, bending over the stream like enormous cornucopias. The fire has never reached them, as they and the forest around plainly show; and every here and there you are puzzled on seeing a Sassafras tree with a

root on either side—one in particular forming a natural arch, underneath which you can walk. And it was some time before I could tell how it was ever possible for the tree to have grown there, until, on looking further, I perceived that the Sassafras must have originally sprung from seed lodged in the bark of some Swamp Gum that had fallen across the brook; and, as it grew, it gradually sent out roots along the trunk until they met *terra firma*. The trunk having, in the course of ages, decayed, has left the Sassafras tree in the odd position in which we now see it. I say so much before I give you the measurement. I am sure the whole scene would amply repay you for the trouble of a ride; in addition to the giants below, there are, I feel confident, within a mile, at least 100 trees of 40 feet in circumference. One, about 40 yards from the biggest, was 60 feet at 4 feet from the ground, and, at 130, must have been fully 40 feet in circumference; it was without buttresses, but went up one solid massive column, without the least symptom of decay. A Silver Wattle was 120 feet high, and 6 feet round. In fact, we named it the Vale of Giants, for puny indeed did men appear alongside these vegetable wonders. The largest we measured was, at three feet from the ground, 102 feet in circumference, and at the ground 130 feet. We had no means of estimating its height, so dense was the neighbouring forest, above which, however, it towered in majestic grandeur. This noble Swamp Gum is still growing, and shows no signs of decay; it should be held sacred as the largest growing tree. The largest Oak on record is the Cowthorpe, in Yorkshire, which is 48 feet in circumference at 3 feet from the ground. Some hollow pollard Oaks are larger, such as the Winfarthing, in Norfolk, which is 70 feet at the ground. The second tree, also a Swamp Gum, is prostrate. It measures, from the root to the first branch, 220 feet, and the top measures 64—in all 284 feet, without including the small top, decayed and gone, which would carry it much beyond 300 feet. The circumference at the base is 36 feet, and at the first branch 12 feet, giving an average of 24 feet. This would allow for the solid bole, 10,120 feet of timber, without including any of the branches. Altogether as green timber, it must have weighed more than 400 tons. The Oak that gave the most timber was the Gelonos Oak, in Monmouthshire, which, with its branches, turned out 2426 feet, but the body alone only 450 feet. * * Believe me, yours very truly,

"'THOMAS J. EWING.'

"His Excellency the President mentioned his having strongly recommended to the Right Hon. the Secretary of State for the Colonies, and to the Lords Commissioners of the Admiralty, the timber of our Blue Gum (Eucalyptus globulus). Plank can be obtained from it in lengths surpassing those of any other timber tree; and it may be sent home and sold at 8*d*. per foot, while Oak plank (to which it is not inferior in quality), of the largest obtainable lengths, costs 2*s*. 6*d*. per foot."

Similar, although less striking, accounts of these Gum-trees are given by Mr. James Backhouse in his "Journal of a Visit to the Australian Colonies," as will be seen by the following extracts:

"On an old road, called the Lopham-road, a few miles from the Bay, we measured some stringy bark trees (Eucalyptus robusta), taking their circumference at about 5 feet from the ground. One of these, which was rather hollow at the bottom and broken at the top, was 49 feet round; another that was solid, and supposed to be 200 feet high, was 41 feet round; and a third, supposed to be 250 feet high, was 55½ feet round—as this tree spread much at the base, it would be nearly 70 feet in circumference at the surface of the ground. My companions spoke to each other when at the opposite side of this tree to myself, and their voices sounded so distant, that I concluded they had inadvertently left me to see some other object, and immediately called to them. They, in answer, remarked the distant sound of my voice, and inquired if I were behind the tree!" (P. 115.)

"In company with J. Milligan and Henry Stephenson, a servant of the company, from near Richmond in Yorkshire, we visited a place in the forest remarkable for an assemblage of gigantic stringy barks, and not far from the junction of the Emu River with the Loud-water, the latter of which takes its name from three falls over basaltic rock at short intervals, the highest of which is 17 feet. Within half a mile we measured standing trees as follows, at 4 feet from the ground. Several of them had one large excrescence at the base, and one or more far up the trunk: No. 1, 45 feet in circumference, supposed height 180 feet, the top was broken, as is the case with most large-trunked trees; the trunk was a little injured by decay, but not hollow. This tree had an excrescence at the base, 12 feet across, and 6 feet high, protruding about 3 feet. No. 2, 37½ feet in circumference; tubercled. No. 3, 35 feet in circumference; distant from No. 2 about 80 yards. No. 4, 38 feet in circumference; distant from No. 3 about 50 yards. No 5, 28 feet in circumference. No. 6, 30 feet in circumference. No. 7, 32 feet in circumference. No. 8, 55 feet in circumference; supposed to be upwards of 200 feet high; very little injured by decay; it carried up its breadth much better than the large trees on the Lopham-road, and did not spread so much at the base. No. 9, 40½ feet in circumference; sound and tall, No. 10, 48 feet in circumference; tubercled, tall, with some cavities at the base, and much of the top gone.

"A prostrate tree near to No. 1, was 35 feet in circumference at the base, 22 feet at 66 feet up, 19 feet at 110 feet up; there were two large branches at 120 feet; the general head branched off at 150 feet; the elevation of the tree, traceable by the branches on the ground, was 213 feet. We ascended this tree on an inclined plane formed by one of its limbs and walked four abreast with ease upon its trunk! In its fall it had overturned another, 168 feet high, which had brought up with its roots a ball of earth 20 feet across. It was so much imbedded in the earth that I could not get a string round it to measure its girth. This is often the case with fallen trees. On our return, I measured two stringy barks, near the houses at the Hampshire Hills, that had been felled for splitting into rails, each 180 feet long. Near to these, is a tree that has been felled, which is so large that it could not be cut into lengths for splitting, and a shed has been erected against it; the tree serving for the back!" (P. 121.)

As we have already observed, there seems to be no reason why these prodigious trees should not, at some future day, decorate the scenery of Great Britain. Devonshire and Cornwall, or Cork and Kerry, would certainly prove capable of bringing them to maturity. *Paxton's Flower Garden for May.*

## FOREIGN GARDEN GLEANINGS.

(ST. PETERSBURG.)

PAWLOWSKI GARDEN.—This garden, the most beautiful of all those of the English style, was first created in 1780, in the reign of Catherine II. It was designed by Brown, to whom an accurate survey of the ground was sent, by his countryman, Goold. Nothing which could by any possibility have been introduced for the purpose of beautifying the place has been omitted; there are lakes, basins, canals, rivers, elegant bridges thrown across streams of water, farms, and, above all cottages, which, though of a poor and unattractive exterior, contain the most elegant statues, large and costly articles of china—the whole being most skilfully broken by means of patches of flowers, clumps of shrubs, or thickets of Oak, Birch, Scotch Fir, Larch, Poplars, and Aspens. That which most deserves attention is the Rose pavilion; nowhere that we know of, is such a remarkably fine effect produced as in this charming spot.

At a short distance from the theatre, is Catherine's private garden, which is entirely filled with ornamental plants. In form it is semicircular, and bounded on two sides by high walls, against which are two parallel lines of houses; two large open screens permit persons to see at a glance all over the grounds; the larger portion of the garden consists of a thick turf, with here and there a bed of flowers; there are two Italian Poplars in the open ground, but they have been much injured by the severity of the climate. Planted, they say, in the reign of Catherine, they are still only 9 feet high; their base alone is large and healthy, the rest is withered and stunted.

On the south side of the grounds are the greenhouses and stoves, Orange houses and wooden pits, all under the care of M. Weimann. This gentleman pays especial attention to exotic plants, of which he has a fine collection. The Indies, America, China, Japan, and the Cape, are all represented by their peculiar plants. We saw there specimens of Metrosideros glauca, Diplacus aurantiacus, Erica arborea, forming pyramids more than 13 yards high, Palleria Aromatica (?) and a remarkably fine Podocarpus.

Amongst other plants not less worthy of notice were an immense Cyperus papyrus, a Brexia in flower and more than 9 feet in height, an Epiphyllum Hookeri 2 to 3 yards high, Begonias from 5 to 6 yards, some patches of Crinum, a Cecropia peltata 10 yards in height, a large Pandanus odoratissimus in flower, a monstrous Littæa geminiflora, some fine Strelitzias, an Amelia macropetala (?) a large Zamia, a Dracæna arborea, and a Puja coarctata 4 feet high and in flower.

Mammillarias are here too in great abundance; in summer they are merely placed in wooden sheds, which are covered with planks in the very hot weather; this treatment, which is also adopted for many other American plants, is found to answer every purpose.

Like most Germans, M. Weimann is passionately fond of Pinks. Begonia discolor, so beautiful in flower, and so handsome with its foliage, is also especially cared for: it is sometimes eaten instead of Spinach. There is, too, a very fine assortment of Geraniums; several of these form pyramids 3 yards high.

CHATEAU DE PETERHOFF.—A fine canal leads the stranger to the front of this chateau. The first object which meets the eye is the famous Samson, who is represented high upon a rock forcing open the jaws of a lion, of which the head alone is visible; from the dying animal proceeds a large jet of water, which rises far above the gigantic Epiceas which surround the group.

We will not speak of the rich architecture of the palace, or of its charming situation above the Gulf of Finland, or of its cascades. The water-works are something like those of Versailles. At the bottom of the park, near the gulf, is the wooden house from which Peter the Great used to view his fleet, and on the other side the stranger admires Monplaisir, one of the most charming spots in the country.

The principal garden is behind the palace; it is laid out in squares, in the middle of each of which is a basin of water surrounding a pedestal, on which is placed a statue. The borders contain some old Lilacs and other hardy shrubs.

In that part of the garden which lies west of the palace are the gardeners' residences and houses for the propagation of rare plants. The front of the largest of these houses is covered with Rose trees and Belladonna maxima (?) There is a pretty hedge of Fuchsias, and the whole garden is intersected with beautiful avenues of lofty Apple trees trained in espalier.

Half a mile from Peterhoff is another garden, that of Alexandrina. We need only state it is one of the gayest in the summer season. *Masson's Report.*

## Home Correspondence.

*Forcing Asparagus.*—"T. P.'s" plan of forcing this highly esteemed vegetable, although in many respects excellent, has nevertheless one great disadvantage, viz., the destruction of the roots after they have been once forced. The plan I adopt here has a decided advantage over any other I have ever seen or heard of; and it is worthy the attention of all early Asparagus growers. It is this: in the first place, the beds are made in the usual manner, except that they lay east and west, instead of north and south, and are of the width of a common Cucumber frame. The trenches or alleys between them being 2 feet wide and a foot and a half deep from the surface of the bed, a tile drain is laid along the bottom of each trench, to carry off any water that may penetrate the linings during the time of forcing. The bed intended to be forced is covered with hot stable manure a foot in thickness, say, in the beginning of November, or earlier if desired, and the trenches are filled with linings of the same material. When the young heads appear above-ground, which they will do in 10 or 12 days from the time of laying on the manure, the latter is then carefully removed and the bed covered over with a little fine soil. A frame is then put on and the linings renewed, raising them up to the top of the frame and covering the glass with bast mats; or what is still better, framed covers of straw. The young heads will grow faster as the bed becomes more thoroughly heated. The covering is taken off every day, and a little air given. The Asparagus is ready for cutting in four or five weeks from the time of putting the manure on, and it is almost as green as it is in May. A far better succession is obtained by this method than by removing the roots into a forcing pit, and the same beds may be forced for any number of years. Mine have been regularly forced for upwards of 30 years without injury. What we force first we give a season's rest: the second is forced every year; indeed they produce finer Asparagus as the roots grow older, provided a proper dressing of salt or other manure be given after each cropping, and the sides of the beds protected at all times with part of the manure which is left for the purpose. *J. W., Daryhulme Hall, Lancashire.*

*Kew Pleasure Gardens.*—My attention has been drawn to a coarse attack made upon me in your publication of the 19th ult., relative to a letter, written by me, which appeared in the *Times* of the 10th, respecting these gardens. My letter to the editor of the *Times* bore precisely the same heading as the present, but the word "pleasure" was omitted, either by the printer or the editor, and hence the overflow of gall which induced you to write the article to which I allude. It is to be regretted that persons who undertake the management of a public newspaper should be deficient of that degree of courtesy which is common in civilised life, and I would respectfully suggest, that henceforth the snappish writer of the article in question should conform a little more to the axioms of Lord Chesterfield. *Kewensis.* [We are not aware that either courtesy, civility, or any other sort of consideration, is due to persons who avail themselves of the press to propagate misrepresentations. Such persons are a public nuisance, and must be treated as such. The rougher the usage they receive, the nearer it approaches their deserts. Had the person calling himself "Kewensis," merely expressed an opinion, instead of publishing a falsehood, he would then, indeed, have been entitled to the treatment due to a gentleman. If, as he says, the blame lies with the editorial office of the *Times*, he should have had the honesty to cause the editorial error to be corrected; for which he had ample time. Not having done so, "Kewensis" must be taken to have fully acquiesced in the mis-statement of which he was the origin.]

*Woodlice and Bantams.*—My Cucumbers are now in full bearing; in 48 lights of them not a wood-louse is to be seen; my bantams picked up every one of them during winter—making them worth at least 10*l*. a year to me. I have not a toad on the place now. *James Cuthill, Camberwell.*

*Migratory Birds.*—It may interest some of your readers to know that swallows appeared here, for the first time this year, on the 16th ult. (April). The cuckoo on the 19th, and this afternoon I heard the nightingale. *J. R., Bridgewater.*

*A few words about Plums.*—Your correspondent "J. R." deserves our thanks for describing the manner in which Reine Claude de Bavay bears its fruit, for we shall now know how to train it to most advantage. I have just planted two, one on a west wall, the other in the open quarters for a pyramidal. "J. R." will find that Chapman's Prince of Wales, treated as his Claude de Bavay will produce its fruit in precisely the same manner, especially if the shoots of the current year be shortened in August. A pyramidal that I budded in 1846, on a strong stock, at about a foot from the ground, has now some blossom on every shoot of last year's growth. I have just examined the tree, and have not been able to find a single shoot without blossom, from the leader at 10 feet from the ground to the lowest branch; and it is abundantly furnished in the usual manner with fruitful spurs on the two and three years old wood. There is in the village in which I reside, a Green-gage tree the suckers from which make very pro-

ductive trees; and there is no perceptible difference between the fruit which they bear and that of the common Green-gage. The parent tree must, I suppose, have been raised from seed. I have a young tree that I raised from a Green-gage stone, and I perceive that the foliage is more like that of its parent than any other. These facts have induced me to put the question to your correspondents, whether the experience of any of them comfirms the supposition that the Green-gage can sometimes be reproduced by seed? Coe's Golden Drop is another admirable Plum, but I find that more than three-fourths of the fruit fall off when they are about the size of Damsons. How is this to be accounted for? My tree is trained on a west wall. I raised two seedlings from it, but they have all the appearance of the common wild Plum. Reine Claude Violette or Purple-gage, the merits of which were recorded by one of your correspondents some time back, is, as regards flavour, the most delicious Plum I have ever tasted, superior to the old Green-gage, and rather larger. It bears well here as an orchard tree, but it is a little inclined to crack and produce gum. Is this tendency likely to be prevented in the case of young trees of this variety by training them on a wall? One word more. Is there any one who can tell me the name of a Damson answering the following description. The tree is an abundant bearer, ripening its fruit in October. The fruit itself is almost black, of the size and form of the common Muscle Plum, and therefore larger than other Damsons, being from 1 inch to 1¼ inch in diameter. In other respects the tree was like the common Damson; it grew in the garden of Saling Hall, Essex. *C. B., Rutland.*—P.S. In Forsyth's old book upon Gardening there is, under the name of "Shropshire Damson," a description which answers exactly to the Damson I have just described. But that name is now given to the Prune Damson.

*Deodars.*—I believe that an "Old Sawyer" has hit upon the true solution of the imperfect growth of some Deodars. I have planted both cuttings and seedlings. I never could get a cutting to grow upright, or furnish itself well, and I never knew a seedling fail to do so. I have some planted in very exposed situations, and some among trees; all grow equally upright, though the shoot is pendulous when young. Perhaps if a tree raised from a cutting be cut down to the ground, it will afterwards grow symmetrical. Cuttings of Araucaria excelsa will make trees thus, otherwise they are quite one-sided. *J. R.*

*Village Instruction.*—Months have passed, and I have not been able to devote a thought to the fulfilment of a half promise I made you, of saying something on this subject, as an appendage to what I stated about "village excursions." And, after all, I feel myself ill qualified for saying much on the subject of village education, for my experience does not extend beyond the management of an ordinary village school, of about 50 children, all under 14, over which there presides a mistress, not regularly trained to her duties. My friend Dawes, the present Dean of Hereford, has shown us all what may be done for our villages, provided a fair start can be made, with sufficient accommodations for a competent teacher. He has so fully discussed the merits of the case, that it would be idle for me to add my inferior experience, except, perhaps, in a single point, on which I will venture to say a word or two. The plan of questioning children on a variety of topics, and giving them occasional information in the way which the Dean of Hereford has suggested, is probably familiar to many of the clergy, though few may have carried it to the extent which he proposes—one plan leads to another, and the establishment of horticultural shows in connection with an allotment system lately introduced here, gave me the idea of teaching our school children the names of our Hitcham wild flowers, and pointing out the leading distinctions between the several families to which they belong. I began last June by fixing narrow stands across the end of the school-room, in which were placed vials filled with water, and before them the names of all our wild flowers systematically arranged. The children were directed to bring all they could find in flower, and the stands were soon filled. I found they eagerly caught up the plan, and soon became familiar with the chief families, so as to be able to recognise a plant belonging to them when first presented to their notice. This year nothing seems to escape them; and every child who first brings a fresh flower enters it with the date when gathered, and I have already had two added to my hitherto known stock. In order to assist them in this pursuit I have printed our list, of which I enclose you a copy, and I propose drawing up brief descriptions sufficient for the object in view. Some of your correspondents were last year discussing the question of establishing an English nomenclature for Botany, and it seemed to be your conclusion, that it would not be expedient to form one for all plants, in which I perfectly agree. But it seems to me very expedient to establish an English nomenclature for our British plants; and so far as our Hitcham wild flowers are concerned I have attempted this in the list now forwarded. The names of the orders are chosen from your "Vegetable Kingdom," and the genera and species selected chiefly from Hooker's and Arnott's recent edition of the "English Flora." In this work two or more names are given to the same genus, and I have consequently been obliged to select one; and in some cases to deviate from the name given to the species. I could wish to see a committee of botanists established for settling definitively an English nomenclature for all our British plants, so that each might have its English class, order, and genus defined, as well as some merely trivial name, by which it is at present most generally known. No doubt we shall have some objectors to the introduction of village botany, and a few scoffers at teaching children such long-winded words as Dicotyledons and Monocotyledons. But even the last is one syllable short of Plenipotentiary, and a host of others introduced into our spelling-books. I do not see why a child should not be taught the meaning of a long word which is used in the classification of plants, rather than be compelled to learn such a one as is intended to set forth the office of the above-named functionary, whom neither they nor I, and probably not one of your readers ever yet saw, or is ever yet likely to see. Explain the meaning of the terms essential to the classification of plants, and children get them up very readily and learn to apply them very satisfactorily. The habit of discrimination, which a little knowledge of natural history confers, seems to me eminently useful to our village scholars, and I wish I had thought of introducing the subject earlier. In order to assist them in discriminating the plants brought to the school, I have placed there an herbarium of most of those which have been found in the village, and I dare say, before the year is over it will be pretty complete. At our horticultural show last June we had 56 competitors among the children of the village for prizes for wild-flower nosegays. It was an interesting sight to see them all busy preparing their nosegays on the spot, and afterwards to see these ranged on the stands before the more showy flowers of the garden. Some of the farmers complained that the children got among their Wheat to gather Poppies, for which the children were duly lectured, and told they were not to do so again; and the complainants were duly advised not to tempt the children by allowing Poppies to grow among their Wheat. I hope this year to find out who knows the most names, and who can refer most plants to their proper orders, and to reward accordingly. As for teaching matters which do not immediately bear on the occupations of the parties we have to instruct, it would be difficult to object to teaching our villagers a little botany, whilst mathematics is made the staple of a clergyman's education at the University. This or that is taught in order to improve the mental faculties; and if in addition we can superadd a little information that may be either pleasurable or useful through life, we need not care for the strictures of those who condemn what they do not comprehend. That our populations are woefully in need of better education than most of them receive is now become a trite observation, and if your readers will refer to a pamphlet or two, that have lately been written by Mr. Zincke, they will see sufficient reason for wishing that the plan suggested by Mr. Dawes could be carried out in every village in the kingdom. *J. S. Henslow, Hitcham, April* 28.

*Studding Walls.*—I did not see your Paper of the 19th ult. until late last week, or I would have "obliged" "David" earlier, by stating that wall studs, if I understood the information referred to by me at page 230 aright, injure trees by presenting objects against which their branches maim themselves, as they advance in growth and acquire comparatively immovable positions; and further, they were discarded because found to be far from "efficient," particularly in training young trees. I am not aware that I am at liberty to refer publicly to the establishment alluded to at page 246, but if "David" will let me take his name and address at the post-office, Bedford, I will give him privately the name of such establishment. *J. T., Bedford, April* 29.

*The Calceolaria.*—In an article on this flower, at page 262, by "M. P." it is stated, that, the plan of propagating by seed is undoubtedly the best. In this I beg to differ from the writer; I consider that the method of propagating by cuttings possesses a decided superiority over seed; for whatever object the plants are grown, whether for internal or external decoration, it is indispensable that the colours of the flowers should be bright, distinct, and well contrasted. Now it must be evident to every one, who has had much experience in the raising of seedlings, that the majority are worthless, possessing none of the above-mentioned properties; hence I contend that for general adoption, the practice of raising seedlings is not to be commended, as it will only be fraught with disappointment to those who have but limited means at command. Of course, these remarks do not apply to those who have abundant facilities, and who cultivate with a special view to the raising of improved varieties. I consider that an intermediate shift is better than to transfer the plant from small pots into their flowering ones, as the plants are impatient, at the period alluded to, of having too much cold soil brought into contact with the roots, when their absorbing properties are in a comparatively dormant state. There is another point in which I think "M. P.'s" system of culture is behind that of many of the cultivators of the present day; and that is, in the omission of watering with liquid manure well diluted with water; this is one of the most essential features of a system producing a very high degree of floral development. As soon as the roots have reached the sides of the pots, applications of liquid manure should be resorted to once a week, and saucers placed under the pots, kept constantly partially filled with the same; the result of this will be remarkably healthy foliage and noble flowers, far surpassing in beauty those which have had no such assistance, though grown in precisely the same soil. Syringing, though requisite to produce sufficient atmospheric humidity, is of very little utility in preserving the plants from the ravages of the green-fly. A fumigation of tobacco is the only effectual remedy, which should be repeated two evenings in succession, at intervals of every three weeks or a month. *W. Rumley, Chatsworth.*

*Penny Banks.*—Can you answer a question which may benefit gardeners' boys. It is said here that penny banks have been lately established and found very serviceable. A benevolent lady in this neighbourhood is anxious to promote one, but can get no working information on the subject. If you could give any reference to publications on this subject, or any directions to persons capable and willing to give useful hints, you would much oblige. I do not mean anything of a club, but a penny bank. *A Gardener's Boy.*

*A Curiosity.*—We have received this in reply to an answer among Notices to Correspondents, at page 248:

"I Beg leave to inform you as you ask Wheather I am Simple enough to Beleive that your pea sticks have produsedthe most miserablest I ever Saw I heav every reason to Believe it And So will any practicle man quite Absurd to Shut out the Crop from Sun or air I hope you were not affraid to publish the few lines I Sent Concerning the Steaking of peas Before the make there Apperance or immediateley after Sown I only hope he the most experiensed gardener in Eneglandwill not Direct us to Stick peas Before the Ar Sown. I think I Do know how to DisBud for this last 20 years and one of the first who advertised in your paper for A Situation. your Most obliged *J. C., Liverpool.*"

## Societies.

Horticultural Anniversary, *May* 1.—R. Hutton, Esq., in the chair. The annual report of the Council and Auditors was read. It was resolved unanimously that this report be adopted. It was proposed by Mr. Charlwood, and seconded by Mr. Glendinning, that the Council take into consideration, at the earliest possible opportunity, the expediency of allowing Fellows to obtain any number of tickets at 3*s.* 6*d.* each, up to some given period antecedent to the yearly exhibitions. It was also proposed by Mr. Glendinning, and seconded by Mr. Matyear, that the Council likewise take into their consideration the expediency of allowing Fellows personal admission, with friends, into the gardens on Sunday afternoons, subject to such restrictions as might be considered necessary. The ballot for Council and officers then took place, when Sir P. G. Egerton, Bart., M.P., Sir C. Lemon, Bart., M.P., and Dr. Royle, were elected new Members of Council, in the room of Dr. Daniell, J. E. Denison, Esq., M.P., and R. S. Holford, Esq. The Duke of Devonshire was elected President; J. R. Gowen, Esq., Treasurer; and Dr. Royle, Secretary. S. F. Gray, and C. Loddiges, Esqrs., were appointed Auditors for the ensuing year.

Royal Horticultural of Ireland.—[We find in the *Dublin Commercial Journal* and *Family Herald*, the following extraordinary statement. The italics are ours.]—The Spring Show of this Society took place on Tuesday, at the Rotundo. The weather was highly favourably, and the visitors numerous and most fashionably, notwithstanding an unworthy and unfair attempt to prejudice the attendance by in advertisement from the "Royal Horticultural Improvement Society." *The display of greenhouse plants was gorgeous;* in the list of prizes we will particularise. *The horticultural productions were very few indeed,* but *we missed some of the contributions to florists' flowers,* which was a serious drawback indeed. The Hyacinth class was admirably contested. His excellency the Lord Lieutenant and the Countess of Clarendon and suite honoured the Exhibition about 3 o'clock, and were accompanied by Lord Monck, J. R. Weld, Esq., C. P. Croker, Esq., M.P., George Roe, Esq., J. M. Chaytor, Esq., J. W. Lane, Esq., Sir George Hodson, Bart., &c. [Are we to infer from this, that the greenhouse plants consisted of the Lord Lieutenant and his suite?]

Botanical of Edinburgh, *April* 10.—The President in the chair. Several donations were announced. Mr. M'Nab exhibited a stem of Statice arborea, from Prof. Syme's garden at Millbank, nearly 1¾ inch in diameter, together with a specimen of the stem of Caryota urens, which had been cut down last year in the Botanic Garden. The same gentleman also exhibited, from the garden of Dr. Neill, an example of Gentiana verna, in full flower, in a pot. The patch was 8 inches in diameter, and the number of flowers was 106. A flowering plant of what is now generally cultivated in British gardens under the name of Bryanthus erectus was also shown. The original plant was produced, during the year 1841, by Mr. Cunningham, of the Comely Bank Nurseries, from seed of the Phyllodoce (Menziesii) empetriformis fertilised with the pollen of Rhododendron chamæcistus. This mule has therefore been figured under a generic name which it is not entitled to (see Paxton's "Flower Garden," No. VII., Sept., 1850). It is, however, exceedingly beautiful and flowers abundantly in the open border during the months of May and June, and is one of the few instances we have of a hybrid raised between two distinct genera. The following communications were read:—1. On a supposed new species of Rubus. By F. J. A. Hort, Esq., of Cambridge.—2. Notice of Narcissus (Ajax) lobularis, Haw. By J. T. Syme, Esq. Dr. Balfour read a communication from Dr. Duncan, on the supposed poisonous effects of the seeds of Abrus precatorius. This communication had reference to the case of three children in a family, who, after swallowing some of the seeds of Abrus precatorius, well known as the red West Indian Peas, with black specks on them, had been attacked with vomiting, giddiness, and other symptoms of poisoning. The Peas had been swallowed about three in the afternoon, and the symptoms developed themselves about eight in the evening. Under the use of emetics the children all recovered. It was remarked, that considerable difference of opinion exists, as to the qualities of these Peas. Dr. M'Fadyen, in his "Flora of Jamaica," says, that they are merely indigestible, and not poisonous; while Dr. Lindley and others state that they belong to the nar-

cotic division of leguminous plants. The present case confirms the latter view, and points out the necessity of caution, in allowing children to amuse themselves with these seeds. Mr. M'Nab gave the following report on the state of vegetation in the Edinburgh Botanic Garden, from 14th March till 10th April, 1851. He remarked, that about a dozen of the plants noted as in flower before this time last year, have not yet flowered :—

| | Date of Flowering. 1851. | Date of Flowering. 1850. |
|---|---|---|
| Draba aizoides | March 14 | March 15 |
| Puschkinia scilloides | ,, 15 | |
| Leontodon Taraxacum | ,, 16 | |
| Acacia affinis | ,, 16 | |

| Carex montana | ,, 10 | ,, 9 |

Three new members were elected.

## Garden Memoranda.

Messrs. Lane and Son's Nursery, Great Berkhampstead, Herts.—It will be remembered that at a meeting of the Horticultural Society, held on the 1st of April last, Messrs. Lane contributed an exhibition of cut Roses, fresh and beautiful as in the month of June. So fine a display of the Queen of flowers in such vivid colours at so early a season necessarily attracted much attention, and therefore we have thought it expedient to furnish our readers with some information on the subject, beyond what is stated at page 215. Some time last year Messrs. Lane put up a span-roofed Rose-house, 60 feet long, 20 feet wide, and 9 feet high, and glazed it with good sheet glass in large panes, in order that as much light might be admitted as possible. Having no stage in the centre, the floor of this house was filled last autumn with Roses standard, high in the middle, and gradually sloping off to dwarfs at the outer edges, the surrounding shelves being occupied with the smaller varieties. All were lifted and potted in the spring, previous to their introduction into the house, and when placed there, the only care they required was ordinary treatment and a healthy growing atmosphere. In order to supply the latter requisition, Mr. Lane, considering the principles of Polmaise a step in the right direction, decided on adopting a modification of that system of heating, and the result has proved all that could possibly be desired; for with a very small consumption of fuel, any reasonable degree of warmth may be obtained, and when the apparatus is in full play, the circulation of the air is so rapid as to visibly move the foliage. Under such conditions it need hardly be mentioned that the plants not only exhibit luxuriant health, but a brilliancy of colouring is infused into the blooms which in a sluggish atmosphere they could hardly be expected to have possessed, and all this has been effected by means of a peculiar arrangement of the common flue. On the outside of the house, near one end, is a furnace constructed of Welsh lumps; the flue from this is led along the inside of the house to near the other end, where it terminates in one upright shaft. This flue, during its whole length inside the house, is chambered or encased in another flue, out of which there are openings for the escape of hot air, which, after circulating across the house, is collected on the opposite side by cold air drains that restore it to the hot chamber, in which it is again heated, and dispersed over the atmosphere; and thus the latter is kept in continual motion—a condition found to be not only highly conducive to the health of the plants, but so agreeable to one's feelings, that, although the heat is 75° it does not seem to be above 60°. Indeed so rapid is the circulation, that no scorching can possibly be experienced; in proof of which, tender Rose shoots overhanging the warmest opening above the furnace were unscathed and flourishing. In a house of this kind "the bloom" will continue in good condition for two or three months, provided the temperature is not very warm and the atmosphere dry. But in addition to the benefits which vegetation derives from this plan of heating, it is also an advantage to the proprietors' pocket. This we think will be acknowledged when we mention that the whole cost of erecting Mr. Lane's Polmaise house, which, as we have stated, is 60 feet long, 20 feet wide, and 9 feet high, is just 38*l.* 1*s.* 9½*d.* This is exclusive of rollers and shading, which would be about 5*l.* more. Among the many fine varieties of Roses which this house contained, we saw few better than our old friends Baronne Prevost, Duchess of Sutherland, Géant des Batailles, Lady Alice Peel, Madame de Lamericière, Madame Trudeaux, Marquise Boccella, Miss Pepin, Polybe, Regulata, Sidonie, William Jesse, Souvenir de la Malmaison, Adam, Devoniensis, Goubault, Moire, Souvenir d'un Ami, and Vicomtesse de Cazes. Most of these are budded on the Dog Rose, on which they are stated to withstand sudden changes from heat to cold, better than on their own roots. The other houses here were extremely gay with Cinerarias, and other early flowering plants, and the Camellias were beautifully in blossom. Among the latter, we remarked many, not more than 4 inches high, bearing large and well-shaped flowers. These are obtained by taking off the blooming points, and striking them in a little heat.

Messrs. Low's Nursery, Clapton.—Few nurseries contain a more extensive collection of plants than this does. Fourteen houses are appropriated to their accommodation, besides long ranges of pits, consisting of many hundred lights. For convenience of reference, the houses have been all numbered—a good plan, where such structures are numerous. 1 is a show-house, filled with large Australian plants, such as Banksias, Dryandras, and a few common things in flower. It is 34 feet long by 16 feet wide. 2 contained Australian plants, and young Indian Azaleas. It is 84 feet long by 16 feet wide. 3 is a span-roofed house, 102 feet long by 16 feet broad; it is furnished with a flat platform in the centre, full of Indian Azaleas and Camellias. We also noticed some fine plants here of the Norfolk Island Pine (Araucaria excelsa), about 4 feet high. The slate platforms round this house were occupied by Camellias, the back and ends with Araucarias, Cryptomerias, and Telopea speciosissima. On two shelves under the eaves of the roof were some thousands of young plants of Thuja chilensis, or Libocedrus chilensis, in beautiful health, along with Juniperus Bermudiana, and a large stock of soft-wooded plants, fit for turning out bye-and-bye into the flower garden. In front of this house are 32 lights of pits, mostly filled with small Coniferous plants, seedling Arbutus, and delicate herbaceous plants. 4 consisted of Geraniums, all in small pots, in order to fit them the better for enduring a long journey. It is 46 feet long by 14 feet wide. 5 contained Australian and Cape plants, mostly from 6 to 18 inches in height. In this house, which is 100 feet long, were many new plants, collected in the Swan River settlement, by Mr. Drummond. 6 is a Heath house, 73 feet by 10 feet, a half span, and ventilated by means of moving shutters in the back wall, as well as at the top; the front lights are likewise made to open. All the houses named above are heated by smoke flues. 7, a Camellia house, is 100 feet long by 14 feet wide, and faces the North; here there was a magnificent plant of the old Nepal Rhododendron, covered with brilliant crimson flowers, also many Cryptomerias, Araucarias, Taxodiums, and other Conifers, some of them of considerable size, together with two trees of the old Warratah Camellia, 10 feet high. When grown to a large size, as this was, this neglected sort is one of the finest of all the Anemone-flowered kinds. 8 is a span-roofed stove, 72 feet long by 15 feet wide. It has a footpath up the centre, and a pit on either side, heated with hot water in brick and cement tanks. In one part of this house were placed 8 lights, under which stove and soft-wooded plants are rooted in large numbers, and here there is no steam to injure them as in a hotbed, while they may have the same moist atmosphere. Associated with Pitcher plants, Hoyas, Ixoras, Mandevillas, and other inhabitants of this class, was a quantity of young Camellias, just taken from the grafting pit. These had already made shoots from 6 to 9 inches in length. At the end of the lights above alluded to, there is a collection of new Chrysanthemums, Verbenas, Fuchsias, &c., imported from the Continent this season, with a view of getting cuttings from them. 9 is a propagating house with double lights, to prevent "drip" from falling on the cutting pots. This is filled with cuttings under bell-glasses, principally Heaths, Epacris, and other hard-wooded plants, which are struck on old-fashioned tan-beds. Upwards of 600 glasses are employed here, while in a small pit adjoining, there were nearly the same number of pots full of cuttings, from which the glasses have been removed. This house is heated by hot water, as is also pit No. 10, which was filled with small Palms and soft-wooded plants; 11 contains a few Orchidaceous plants, and on the platform in front were some hundreds of Pyrus japonica struck from roots, after the manner in which the market gardeners propagate Seakale. 12 was occupied by stove plants, mostly Brazilian, and various Begonias, a genus whose value for the winter decoration of stoves can hardly be overrated. 13, a small one-sided house, filled with Ferns in considerable variety, and against the roof was a raised platform, or broad shelf, 2 feet wide, and running the length of the house, on which were many thousands of the new Rhododendrons from the Sikkim-Himalayas. Upon these Mr. Low has bestowed much care and attention, and there is little doubt that they will amply repay it. At the east end of house, No. 5, is a range of pits, 148 feet in length. The first division is filled with Epacris, among which, the finest was a seedling, raised by J. Wilmore, Esq., of Oldford, Birmingham, named "Delicata." It has beautiful pink buds, opening to a fine blush. The spikes are large, and the flowers equal to those of Hyacinthæflora. The next division contained Conifers, and the two following were filled with Heaths in small pots. There were many other pits filled with young stock, all in a very healthy condition. In order to afford shade to the plants, we observed that in some of the houses the glass was washed over with a paint, made of whitening and water, which is said to answer the purpose perfectly. This keeps the house cool, and tends to prevent the appearance of red spider. The potting shed is quite a model of its kind. It is roomy, light, and means are afforded for warming it in cold weather.

Upton House, Dorset.—There is at present in the gardens here a scarlet Rhododendron 10½ feet high, and 33 feet in circumference, which has upwards of 400 expanded blooms on it, and betwixt 400 and 500 more to open.

Messrs. Sutton's Nursery, Reading.—An interesting collection of fruit trees, consisting of Pears on Quince stocks, Apples on Paradise stocks, and Cherries on Mahaleb stocks, only from 4 to 6 feet high, are now in full bloom in this nursery, and are singularly beautiful. We are informed that these diminutive trees were loaded with fruit last summer. In another part of the nursery, called "the sample ground," may be seen upwards of 50 different kinds of Grasses growing separately, with the botanical names affixed to each. As but few nursery grounds in the country contain these interesting collections of plants, we doubt not that the opportunities of inspecting them gratuitously afforded by the proprietors will be duly appreciated. *Reading Mercury.*

## Miscellaneous.

*Culture of the Dahlia for Exhibition.*—The following concise rules, to be observed in the successful culture of the Dahlia for exhibition, are not presented so much for any novelty in the practice recommended, as to point out a few of the most essential things to be done at the proper time. For economy in carriage, the plants are grown and sent out in small pots: therefore, on receiving them from the nursery, place them in a close frame for a day and a night to recover them from their confinement; then repot them into 4-inch pots, using rich soil: the pots should be drained with coarse partly decomposed leaf-mould, so that in planting out there will be nothing to abstract from the ball of earth. A good start is of great importance: therefore care should be taken that the plant is grown to a fair size without drawing during the time it is in the pot; the stouter it is the better, without being tall; and it should not be pot bound at the time of planting out: both the roots and the point of the plant should be in a thriving condition, and free from aphides. It may perhaps be unnecessary to state that the plants must be carefully hardened off before they are turned out. If the soil and plants are in a proper state, the first week in June will be a good time for the general planting, which, with ordinary care and attention, will produce good blooms in time for the earliest exhibition. A short period will suffice to have plants of a good size; but it should be borne in mind that hours lost in repotting them when in a young state will make a difference of days in the time of blooming, and it is important that this should be clearly understood, that no neglect in the matter may be permitted to take place. Examine the plants often, to see if any require water; by no means let them become dry so long as they are in pots. Secure them with proper and strong fastenings at the time of planting; water whenever they require it, and sprinkle the foliage slightly almost every evening with soft water. Tie out the branches, and, as the plant increases in size, secure the side-shoots firmly to extra stakes. Cut away all superfluous small shoots. Some varieties have scarcely any to remove, while others have a considerable number. Fearless is of the class which has but few shoots requiring the use of the knife; but such kinds as Shylock require it freely. Indiscriminate pruning must therefore be avoided. Study the habit of the plant, and consider if the flower will be improved by increased size; all varieties need some thinning and disbudding, which should be effected at different periods. Small flowers require it as soon as the young shoots and buds can be removed, while large flowers, such as Thames Bank Hero, Princess Louisa, and many others, would be rendered coarse and valueless for the purposes of exhibition if a number of buds were not permitted to remain till the plant was coming into bloom. Size in this case would be gained at the expense of quality; besides, there is the advantage of having three blooms where two would be grown. On the other hand, size, in moderation, must not be lost sight of. It was not with small blooms that I have taken first prizes for these last 15 years. I would therefore advise the young grower to avoid the two extremes. In shading blooms for exhibition, as a general rule, they should be one-third blown before they are put under the shade; and take care to secure such as appear to be coming good, and at the time they are required, from injury by friction. Slugs and earwigs are very destructive, and must be perseveringly kept down from the time the plants are put out till the end of the season. If you should be annoyed by a small black insect (which is often the case in July), use every means to encourage

the plants to make rapid growths, by watering and syringing them overhead, and by brushing the depredators from the points of the shoots. Snuff, tobacco-water, and various other remedies are often resorted to; but these, if effectual in killing the pests, generally destroy the points of the shoots: if the plants are in a thriving condition, they will soon recover themselves. If the season proves dry, water freely two or three times a week; but never let it be done by halves; give a good soaking when you do water, if that should not be so often. Employ manure-water once a week as soon as they begin to throw up their buds; but it should be used in a weak state at the commencement. Before concluding these remarks, permit me to bear witness to the increasing interest taken both in the culture of the Dahlia for competition and in the raising of seedlings. The enjoyment and pleasing recreation attending the cultivation of florists' flowers add numbers to the fancy; and I have much satisfaction in stating that no flower is more generous in repaying the enthusiastic florist for his labour than the Dahlia. *Mr. Turner, in Becks' Florist, Fruitist, and Garden Miscellany for May.*

## Calendar of Operations.

*(For the ensuing week)*

### PLANT DEPARTMENT.

Scarcely a day will now pass without some of the plants being observed to require repotting; and nothing tends more to keep up the healthy appearance of a collection than timely shifting. Let due attention, therefore, be paid to this point, and to a proper selection of soils, as a little neglect on these heads is ruinous to the plants, and consequently tends to put their owners quite out of taste with them. Many of the free growing kinds, which were potted early in the season, will require larger pots, with which they should be immediately supplied, unless it is wished to flower them in their present sizes, and somewhat earlier than their usual season. In the latter case occasional waterings of liquid manure of moderate strength will be useful, both to maintain their present vigour and to assist the future development of their flowers. Keep a moist growing atmosphere in the conservatory by frequently sprinkling the paths, curbs, and other evaporating surfaces, in warm weather; and when syringing, sprinkle well the walls of the house, that they may give off, in combination with moisture, the heat which they have received during the day. In fine weather, a little before the sun goes off the Pelargonium-house, the plants that are not in flower should be syringed, the water used being soft, clean, and fully as warm as the atmosphere of the house; for, without this, the object for which it is done will be defeated. In the Orchid-house the moisture should be moderate, unless when the weather is so fine that it may be accompanied with light and heat. In watering and syringing, care must be taken to prevent the moisture lodging in the young growths, as they are liable to damp off in their early stage. The beautiful Phalænopsis and many others will be benefited by a slight dewing several times a day; as, by so doing, their roots will be kept active, one of the great things to be aimed at in Orchid growing. Constant attention will be necessary to keep the plants clean and free from insects, of which all the troublesome kinds breed most rapidly at this season. Encourage specimen plants of the choicer kinds of Fuchsias, Erythrinas, Oleanders, Brugmansias, the red Chinese Hibiscus, &c., for placing in the conservatory, along with the various kinds of Thunbergias, and other tender annuals usually grown for summer and autumn decoration; all of which should be shifted on progressively, using rich loamy soil.

### FORCING DEPARTMENT.

Pineries.—Pines require plenty of room, to enable their leaves to extend themselves in a natural way; as, when planted too thickly, and kept too close and moist, they are as it were compelled to send them up into the air like so many Sedges or Irises. Like Orchids, they require a high temperature and plenty of moisture; but they must at all times have a sufficiency of ventilation. Vineries.—If the outside borders have been kept covered with warm litter, according to previous recommendations, they will not require water, unless in very dry situations. They should however be occasionally examined, and if necessary should be watered with liquid manure or guano water, in the proportion of half an ounce of guano to a gallon of water. Give air early in the morning, commencing with a little, and increasing it gradually till mid-day. The crops for the supply of the family during the late autumn and winter months will now require regulating as regards the number of bunches. Melons.—Those who are anxious to produce Melons in the greatest perfection, should plant about the beginning of May, as they thereby secure the four finest months in the year for growing and maturing them; and as they are also the months in which insects increase with the greatest rapidity, no pains should be spared to keep them in check. To this end, all damaged leaves should be removed, as insects generally effect a lodgment most easily on those parts of the plants which have received some check in their development, and that are on that account rendered sickly.

### FLOWER GARDEN AND SHRUBBERIES.

In all dry warm situations, the planting out of half hardy plants may now be safely proceeded with; but if a very early display is not an object of the first importance, we would not recommend too great precipitation in the matter, unless the situation is particularly favourable; and even in such a case the precariousness of our English climate renders it necessary to have abundant means of protection always at command. In our own case it is necessary, for the reason above mentioned, to plant very early; but to prevent injury to the plants, in case of a sudden change in the weather, as well as to protect them from the rays of the sun, it is our practice to use branches of evergreens, the lower ends of which are sharpened and fixed in a leaning position over and amongst the plants. The Yew branches taken from the wall trees that no longer require covering, also come in useful for this purpose. This is a simple method of preventing, at a small cost, a loss which would be irretrievable. We of course commence wtth the hardiest kinds, as Pentstemons, Antirrhinums, &c., and follow with Calceolarias and Verbenas, selecting the best established of those plants which have been gradually exposed to the open air. Except in very extensive places, very little advantage is gained by commencing too soon, and the meantime may be more usefully employed by performing all preliminary operations, and getting the work forward elsewhere, that a strong force and undivided attention may be devoted to this work as soon as it can be prudently commenced. It will be advisable to cast an eye over the arrangement, and compare the quantity required with the total in stock, that any deficiency may be provided for by apportioning a smaller number to the different beds, or by substituting something else, of which there is a greater abundance. Consideration should at the same time be given to making a provision for filling up the gaps, which are liable to occur under the most careful management that can be applied.

### FLORIST FLOWERS.

Polyanthuses and Auriculas will in many localities be in their zenith. We would now recommend that they be placed on a stage having a northern aspect, with a light awning stretched over head, by this means the bloom will be considerably prolonged; a good supply of soft water should be given. It sometimes happens, that a weak plant produces a truss of flowers, which so exhausts its energies that death is the consequence; we would advise them to be removed, and the plant treated with weak liquid manure, so that it may gather strength before autumn. As Auricula and Polyanthus pips fade, they should be pulled from the calyx, and seed saved from those with good properties. Carefully tend Ranunculuses; when the bed is properly made they do not require much water, for the quantity of cow manure, in its extreme decayed condition, which is incorporated with the soil, keeps them cool in very warm weather. The greatest precaution necessary is to fill up interstices in the soil, which sometimes occur. Pinks will like a little liquid manure and keeping very clean; should all the shoots give evidence of spindling, cut them off except two or three, according to the size and strength of the plant; they will put out again strongly, and in sufficient number for abundant propagation. Keep the net over Tulips, to prevent damage; we would not advise the awning yet, as it would be apt to draw them, and when Tulips have thin weak stems, unable to support their cups, it detracts seriously from their beauty.

### HARDY FRUIT GARDEN.

Keep the Apricot, Plum, and Peach trees free from insects. The first is often infested by small caterpillars, which conceal themselves in the unfolding buds, and do so much injury to the fruit, as to cause it to fall off. The Plum, Peach, and Nectarine are very subject to the green-fly, which may be easily destroyed by an application of Scotch snuff and sulphur to the affected shoots, by means of a puffer; and after allowing the mixture to remain on a few days, it should be well washed off with an engine, the dead insects being of course removed at the same time. Proceed with the thinning of Apricots, where thickly set; and also with the disbudding of Peaches and Nectarines. Pear blossoms should be thinned where they are too numerous; as nothing is more injurious, both to the fruit and to the trees, than to have too many blossoms, or young fruit to support. A very vigorous tree will be benefited by allowing plenty of fruit to remain on it; but a tree of moderate vigour should have some of the blossoms removed, and after the fruit is set, these also should be thinned according to the strength which the tree possesses.

### KITCHEN GARDEN.

Asparagus beds may still be planted, and the established beds should be assisted with liquid manure of moderate strength, containing salt at the rate of a quarter of a pound to two gallons of liquid. The beds from which you are now cutting will merely require an occasional sprinkling of salt to keep them free from weeds, and also to invigorate them until the cutting is over; after which, they should receive a liberal supply of rich water. Where a portion of the Asparagus beds is yearly required for forcing, cutting should be discontinued, with a quantity sufficient to meet the demand, at least a fortnight earlier than from the general beds. Seakale pots, and the materials with which they have been surrounded, should now be cleared away, the remaining etiolated foliage should be cut off, and the ground should be sprinkled with common salt, and forked over, always taking care not to injure the crowns.

State of the Weather near London, for the week ending May 1, 185', as observed at the Horticultural Garden, Chiswick.

## Notices to Correspondents.

Aquatics: *Neeton.* Aponogeton distachyon, *Calla æthiopica, Nuphar advena, *Caladium esculentum, Nelumbium caspicum, Butomus umbellatus, and *Nymphæa cærulea will make you gay enough. Those marked * will require to be removed in winter.

Canary Bird: *Wilderness.* Your poor little bird is by no means a curiosity. Her husband, I perceive, is much happier now she has left him; and *she* also begins to revive. Good! Let ti is salutary separation continue. It works well for both, evidently. Now that her mind is easy, her head will recover from its baldness, when next she moults; and her feathers will again be regular. Go on cosseting her, and nature will yet effect a cure. Avoid Hemp-seed altogether, and let her ladyship be supplied with a bath, daily. Your friend says, "she sings sweetly." This, for a *hen* canary, is marvellous, exceedingly. Make much of such a rarity. *W. K.*

Deodar Seed: *B D H.* Sow it in pans in pure yellow loam, and place them in a cold frame.‡

Japan Lilies: *T M.* As soon as the bulbs are sufficiently matured, which will be known by the decay of the leaves and stems, they had better be repotted; not that this is of importance at present, but it will economise space, and prevent the operation being neglected until after they have made fresh roots. The soil in which they have been growing ought to be entirely removed from the bulbs, and the latter divided as may be thought proper, for there will always be found about the crown of the parent some small bulbs, which may be placed in 4-inch pots. If the ripening has been complete, the roots will not be troublesome; but if not, there will be found a quantity of fresh roots remaining. When such is the case, leave them to themselves for some time longer; never pot while it is necessary to cut or break the stronger roots, but strip your fingers through them, in order to remove those that are decayed. The pots should be just sufficiently large to receive the bulb and strong roots adhering to it; give a moderate watering to settle the soil, and place them in a greenhouse or cool pit. They will require no further attention until the season begins to excite vegetation, when they must be regularly attended to. Water as soon as you see signs of growth, but sparingly until they have made leaves, &c., to draw up and give off moisture. ‡

Melons: *J H.* Next week.‡

Names of Plants: *W A.* Helleborus fœtidus.—*A M C.* We do not recognise them, but will say more hereafter.—*K.* 1, Hoya carnosa; 2, Genista canariensis.—*Abies.* 1, Adiantum æthiopicum; 2, Selaginella sp.; 3, Doodia caudata; 4, Cassebeera hastata; 5, Platyloma rotundifolia; 6, Pteris serrulata; 7, Selaginella sp.; 8, S. viticulosa; 9, S. apodum; 10, Asplenium bulbiferum; 11, Adiantum macrophyllum; 12, Asplenium cicutaria.—*T C.* Cyrtopodium punctatum.—*J B and Sons.* Cymbidium pendulum.—*No Botanist.* Saxifraga tridactylites.—*G B E.* 1, Pyrus spectabilis; 2, Phlomis fruticosa; 3, Trollius asiaticus; 4, Doronicum Pardalianches.—*J E.* Grevillea buxifolia.—*A Subscriber.* Weigela rosea.

Peach Trees: *K K.* Probably at the elevation of 500 feet above the level of the sea your Peach trees suffer from cold, although the situation is in a southern county; and yet it seems strange that Figs and Apricots should succeed so well in the same garden where these Peach trees thrive badly. Many Peach trees are ruined by laying in the bearing shoots at full length, or nearly so. Perhaps this is the case with yours. Canvas screens are very good for protecting the blossoms from frost; but the substance ought to be thin.‖

Plants for Shady Situations: *W S.* Nothing will succeed well in such a place except Aucubas, tree Box, Leycesteria formosa, Berberis aquifolium, Privets, Hollies, and Laurels. In front of these might be introduced such plants as great and small Periwinkles, St. John's Wort, Lily of the Valley, Wood Anemone, Winter Aconite, Crocuses, Snowdrops, Squills, and Narcissi.‡

Ranunculus: *W Blood.* It is a very interesting morphological case, analogous to what occurs so often among double Roses.

Seeds: *G L.* Raise them in a hot-bed, and, when strong enough, pot them, and treat them like greenhouse plants.

Superphosphate of Lime: *T M.* Apply it in small quantities, and often, rather than in large doses at long intervals.‡

Vines: *J M.* Your leaves are not mildewed, nor do we know what they ail: not much we suspect. Some local disease is present, but the cause of it can only be ascertained in the Vinery itself.

Misc: *A Z.* Three Shillings. Remittance by Post-office order. —*Amateur.* We have never seen Plumbago capensis employed as a bedding plant. The address in the Advertisement alluded to is correct. ‡—*Albus.* Ivy makes the best covering for a paling; but if you must have flowers there, take some Clematis.‡

### SEEDLING FLOWERS.

Calceolarias: *A S H.* As far as we are able to judge from shrivelled flowers, they are not so good as kinds already out.* —*J M.* The best is 4, which is very promising. The others are more common.*

Cinerarias: *G R, and Young Florist.* No improvement on kinds now in cultivation.*—*J M.* All very pretty, but similar to many others already in the trade.*

Polyanthuses: *W D.* Received in bad condition, but apparently a nice variety.*—*A S H.* Entirely shrivelled up when they reached us.*

Violets: *G T.* Worth cultivating on account of its colour.*

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS,

AS THE

ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by Dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

MANURE DEPOT.—PEAT CHARCOAL.

TO FARMERS, AGRICULTURISTS, AND OTHERS.

G. H. FOLEY, Essex Coal Wharf, Lea-bridge, Middlesex, Agent by appointment to the Irish Amelioration Society, for the sale of the above. All needful particulars will be given on application at the above address.

Price of the unmixed Charcoal, 60s. per ton, sacks included. Mixed with Nightsoil, 45s. per ton, sacks included.

GUANO AND OTHER MANURES.—Peruvian Guano of the finest quality; Superphosphate of Lime; Gypsum; Salt; Nitrate of Soda; Moffat's Patent Concentrated City Sewage Manure, and all others of known value.—Apply to MARK FOTHERGILL, 204, Upper Thames-street, London.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9l. 10s. per ton, or 9l. 5s. in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.

40, Bridge-street, Blackfriars, London.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

ARTIFICIAL MANURES.—PRIVATE INSTRUCTIONS in Chemical Analysis and the most approved methods of making Artificial Manures are given by J. C. NESBIT, F.C.S., F.G.S., at the Laboratories, Scientific School, 38, Kennington-lane, London.

Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.

Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.

NEW TURNIP MANURE, 50s. a Ton.—Mr. POTTER can strongly recommend the above as a cheap and efficient Manure, and capable of raising heavy crops. Delivered free on rail. The Bags to be returned or paid for.

POTTER'S GUANO, 7l. per ton; SUPERPHOSPHATE OF LIME, 6l. per ton; GYPSUM, 25s. per ton, including bags and delivery on rail.—28, Clapham-road-place, London.

HOSE FOR LIQUID MANURE, Fire-engine, and agricultural purposes, made of canvass, lined and coated with gutta purcha; it is about one-third the price of leather or india-rubber, will convey liquids of all kinds under a heavy pressure, it is extensively used at the Government public works; also by the navy, and amongst agriculturists, giving universal satisfaction. Testimonials and prices may be obtained of Messrs. Burgess and Key, 103, Newgate-street, sole manufacturers.—London Agents: Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.—Country Agents: Messrs. Ransome and Parsons, Ipswich; Messrs. J. and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. S. Wilson, Agent for Scotland.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY, empowered by Act of Parliament to execute all works of Drainage (including outfalls through adjoining estates), to erect Farm Buildings, and carry out every kind of permanent improvement upon estates under settlement; to provide the money, or to enable the landowner to employ his own capital, and execute the works by his agents, and to secure repayment of the outlay by charge on the property improved spread over a number of years.

Proposals for the execution of works to be addressed to WILLIAM CLIFFORD, Secretary.

Offices, 52, Parliament-street, London.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers: Office, 70, Strand, London.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

RIVERS'S STUBBLE SWEDE TURNIP SEED.

J. RIVERS solicits the attention of Agriculturists to his quick-growing SWEDE TURNIP. The variety owes its origin to a cross between a large variety of the Early Stone, in 1842, and the old Green Top Swede. It has become a distinct variety, by carefully selecting, for seven years, those most like the Swede in habit, so that now it is a true Swede, with the earliness of the White Stone; it is green-topped, with a short neck, with the solid yellow flesh of the common Swede; for sowing in May, for early feed, or for late sowing upon heavy land and sheep-fed leys, it will be found a valuable Turnip for hardiness and keeping qualities; also for sowing near large towns, to draw off early. It grew 11 tons per acre after Tares, mowed, without manure, on the 6th of August, 1849. Specimens of the roots were exhibited at the Baker-street Cattle Show; also specimen roots of different times of sowing, from May till August, were exhibited. Orders for any quantity above 10 lbs. will promptly be attended to, if addressed to JOHN RIVERS, Seedsman, Sawbridgeworth, Herts, at 2s. per lb., carriage paid to London. It will be sold in sealed bags, of 2½ lbs., price 5s.; and 5 lbs., 10s., by his agents, a list of whom will be found in the *Gardeners' Chronicle* of 22d March. Messrs. Sutton and Sons, Seedsmen, of Reading, who proved this Turnip with others in their sample ground last summer, state as follows:—"Seed sown on June 30th, July 20th, and August 10th, using the same manure for all, gave the following results—from the first sowing, the roots were fully equal to the *best* of the other sorts; from the second and third sowing, they were far superior in size, weight, and shape, thus showing its peculiar adaptation for late sowing."

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

THE ANNUAL COUNTRY MEETING of 1851 will be held, by the gracious permission of Her Majesty and Prince Albert, in the HOME PARK, WINDSOR, in the week commencing MONDAY, the 14th of JULY.

Copies of the Prize Sheet, containing the terms, conditions, and amount of the respective Prizes, and the Rules of Exhibition, and also copies of the requisite printed Forms of Certificate may be obtained on application to the Secretary, 12, Hanover square, London. All Certificates must be returned, filled up, to the Secretary, on or before the **17th of May**, the Council having decided that in no case whatever shall any Certificate be received after that date.

In the application for Certificates, the Character and Age of the Animals to be exhibited should be stated, in order that the proper Forms of Certificate may be sent.

By order of the Council, JAMES HUDSON, Secretary.

12, Hanover-square, London, May 3.

# The Agricultural Gazette.

*SATURDAY, MAY* 3, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

THURSDAY, May 8—Agricultural Imp. Soc. of Ireland.
WEDNESDAY, — 7—Agricultural Society of England.
WEDNESDAY, — 14—Agricultural Society of England.
THURSDAY, — 15—Agricultural Imp. Soc. of Ireland.

THE success of a campaign certainly depends upon the courage and energy of officers and men as well as on the skill with which its plan has been devised—but both are necessary things. If the plan has been drawn up in defiance of the physical character, or without regard to the nature of the territory in which it is to be carried out, no energy or bravery in detail will compensate for the error; and, on the other hand, the skill of the commanding officer will rarely make amends for the inefficiency of his men. Now the annual routine upon a farm may well be compared to a campaign. Its plan must be skilfully accommodated to all the natural obstacles and advantages of the scene, and the energy and industry of a good soldier must be brought to bear upon its details, and then success may be expected. Attention and industry, however, are not the only things necessary to make a good soldier. Addiscombe is needed for this purpose as well as the drill. Neither are they enough to make a good farmer. Cirencester, or the truth taught there, is necessary for that purpose, as well as practice in the field. The principles of an art, as well as its details, must be acquired by any who would be proficient.

Those who have the charge of agricultural education are perfectly ready to admit the whole of the case put forward in our last week's remarks on this subject. LAVOISIER, the French chemist, it has been a hundred times asserted, was guided by his chemical knowledge to a pretty constant experience of farm profits; they are ready to admit that it is more than probable that he had the additional guidance of a good farm-bailiff; they perfectly admit the need of industry and energy, and practical skill, which colleges alone cannot give, but they do not see how this admission affects the value or necessity of those qualifications which colleges are able to confer. Practical men are mistaken if they think that men of science look down upon their skill and tact as qualifications of inferior value: theories and speculations, things more within their province, are what they criticise severely, and admit with difficulty, and though long experience has proved the difficulty of ascertaining facts correctly, yet facts and truths, once ascertained with certainty—such, indeed, as practical men alone are able to supply—are what they humbly bow before, and gratefully receive. Theirs is the office merely of arrangement or explanation, and certainly they have no wish to quarrel with the men who furnish their materials. Still less ought men of practice to look down on science; it is the cabinet in which their own experience, and that of all antiquity, has been collected and arranged; its truths may be depended on all the more for the multitude of individual facts on which they rest. The doctrines of the chemist, or geologist, or botanist, are based on facts much more numerous and carefully determined than those on which many a practical agriculturist is content to build his confidence. All farm experience is now believed to be arrangeable along with those other facts in geology and botany and chemistry already ascertained so carefully. Taken piecemeal, it is found to illustrate and corroborate the truths which those already taught, and bit by bit it has been arranged under the guidance of these truths, along with one or other of the sciences or classes into which the sum-total of truth divides itself.

What an absurdity to hold the importance of individual facts, and yet despise the truths they help to teach! This, nevertheless, is the conduct of those who contend for the practical part of agricultural education, and yet feel inclined to sneer at agricultural colleges. These institutions teach by the light of all past knowledge, and, therefore, clearly and distinctly, the very truths which, hidden under the disguise of the peculiarities of season, soil, variety, breed, and what not, affecting individual cases, are indistinctly taught by every year's experience on a farm. How important that a knowledge of these truths should be acquired, stripped of this disguise, so that one might know what is independent of all these peculiarities, and thus be able to apply his knowledge in unaccustomed circumstances. Experience is deemed of value: it is so just in the proportion in which the facts that it has witnessed have taught their lesson perfectly. The longer the experience, the greater is its value, just because, the more the facts of which it takes account, the less the chance of the peculiarities of any of them interfering with the lesson taught by all. Now, science is the result of all experience—its doctrines are the truths which the experience of all time has taught: and yet it is despised by many who profess to praise an experience, furnishing, perhaps, two or three only of the thousand foundation-stones on which science rests!

Now the facts of a single year's experience on a farm are the expression of course not only of the *scientific* truth, so to speak, which they illustrate, but also of every little specialty of the season, soil, and every other cause in operation—and the influence of these is to be estimated and provided for only after the actual observation of their influence and effects. On this ground, therefore, as well as on the ground that on the management of men and economy of labour—a matter on which practice is the only teacher—farm profits much depend, personal practice in the field must always be considered an essential part of agricultural education. But the great truths of agriculture which come within the bounds of one or other of the sciences, are of course equally important, and they may be taught in class rooms as well as learned in fields.

The importance of science as the shortest road to an acquaintance with useful truth, and the importance of practice too in any scheme of agricultural education, are what we wish to illustrate: the opportunities presented in this country and in Ireland for the acquisition of such an education, will be referred to in another article.

THE PALACE of GLASS is open. The Queen of England, in her glittering robes, and attended by her plumed and diamonded courtiers in gorgeous array, has been there enthroned, like an Arabian "Fair One," in her "Hall of Light." The multitudes of visitors who have purchased the keys of this temple of enchantment can now witness the industrial productions of "all nations," and learn what all men are able to do. Decoration and ornament are perhaps in greatest profusion; but there is also every variety of the first necessaries of life—food, clothing, and machines of utility occupying large areas in the building. Peculiarities of country and climate are represented, no less than diversity of art and manufacture; vegetable, mineral, and animal substances, the produce of Nature assisted by Art, being present in every form; so that amongst them, the labours of AGRICULTURE which, being of a more homely and vulgar character than those of Art and Science, and effecting less brilliant and beautiful results, are expressed in numerous specimens of the fruits of the field. As the great exposition is one of industrial works, of course the productions of Nature by herself only are mainly excluded; and yet in not admitting these it comes to pass that agricultural industry is only partially represented—by not providing a class for Animals half the farmer's productions are shut out; and we might almost say, by not taking in the native or wild vegetation, &c., of different countries, as well as those cultivated by man, the difficulties overcome by the farmer, in the shape of weeds and insects, are not displayed. The thing of course cannot be other than it is for answering the desired end, but still it should be borne in mind by spectators of the agricultural departments of the exhibition, that raw produce and machinery are only a portion of the farmer's material and productions. They should couple the coming Show of Live Stock in Windsor-park with the display of food,

fibre, and implements now in Hyde-park, in order to obtain a just idea of the Agricultural Show in 1851. But the assemblage of implements is of itself an ample manifestation of our agricultural spirit and industry; and the evident advance that has been made in this branch of mechanical construction, testifies of the recent improvements in cultivation in Great Britain, both by extension of means and methods, into backward districts, and adoption of new appliances where the land is already best tilled, and betokens, also, our future career of progress and prosperity. And though the Great Exhibition has been stigmatised by some of the farming interest as the "inauguration of free trade," it is pleasing to observe that the implement manufacturers, who depend upon the farmer for support, have done their best to grace and enrich the World's Fair. Whoever may disbelieve in the advantageousness of the show, they are fully alive to its value, and to the benefits likely to be derived both by exhibitors and the public. Now of what use is the Exhibition to the farmer? We believe that it is impossible fully to answer this inquiry; the advantages are too various to be at once apprehended, too many to be easily enumerated and described. We may, however, mention a few of the good results that are to be looked for. It will be an important step in the extension and progress of civilisation, if the taste of the great mass of the humbler classes from our rural districts is quickened and beautified by beholding the graceful and grand structure itself, and the eloquent sculptures, superb ornaments, and creations of the arts which are emphatically "Fine," which arrest and fascinate our gaze within it. It will be of service to us, if, when there, a friendly feeling should go out to those of other nations who have contributed to deck the resplendent avenues with these things; and if the old toast be utterly obliterated from our remembrance—"a certain Duke premier, and a red hot war." It will be of incalculable service to agriculturists to compare by aid of their own eyesight, not by the help of party journals, the mechanical resources of English farmers, with those of foreign cultivators; and from the unspeakable superiority of the former, receive an inspiring hope and courage to sustain them in competition with all the world. And, doubtless, many a farmer will this year find out some practice of distant counties in our own land, or of other countries, which may be of use to him at home; and many a one will see implements and instruments with which he was previously unacquainted, and which may comprise just the form or the motion for which he has been long seeking. And this opportunity is the greater, not only from the presence of foreign tools and machines, but also from the circumstance of the collection of those of Britain, embracing the inventions of a wider extent of country than any previous show in either England, Ireland, or Scotland. And many also will notice specimens of cereal produce, roots, seeds, and Grasses, and of fibres, fleeces, skins, &c., which he may introduce with benefit into his own neighbourhood. But, leaving other means of advantage to be suggested by the reader's own reflection, let us proceed to notice, for the information of those who cannot witness them, some of the more worthy objects of the farmer's attention, to be found in the Glass House of Hyde-park—the great conservatory, where all the fruits of human industry have been nourished into ripeness. Entering, perhaps, into the great transept, where a strangely sylvan scene bursts upon the view—tropical trees shooting fan-like under the shade of English Elms—with the high filmy arch over all, the farmer turns at once toward the department which the crimson cloths overhead proclaim "agricultural;" and passing the rich carvings and gorgeous adornments, the fountains and colossal images, and the glitter of glass, gold, and fancy manufactures, threads his way between the slender pillars, till he is lost amidst the more familiar objects of farm machinery. But ploughs in a Palace, carts and chaff-cutters in its crystal colonnades, are they not unsightly and out of taste? By no means; the implements of the field and barn are here tinted, polished, and burnished so as to be worthy of a place beside the workmanship of Fine Art; and instead of the customary red, blue, black, and green paint, the colours vie with those of the nobleman's carriage, and the metal shines bright like silver, and some is even ornate with gold. No farmer dare purchase such at first, except for his drawing-room; they are for ladies and princes to admire. But when the outside gloss and brilliance have worn off, it is certain that the utility of these machines will meet the expectations of the ingenuity which has framed them. On first entering the class, the eye is bewildered by a succession of steam-engine funnels, drilling machines, cutters, carts, ploughs, wheels, and ponderous engines, the nature of which it requires a minute examination to understand. On each side of the main walk through this long department, are raised stands or galleries erected by some of the principal machinists, crowded with implements and wheels, and one surmounted by an emblematic golden sheaf. On a cursory survey also appear spades, forks, &c., and many beautiful models of farmsteads and farm instruments. Turning our attention first to those *implements used in preparing ground for sowing*, we will begin with the PLOUGHS, a description of which shall be given next week. *I. A. C.*

## ON THE TULLIAN SYSTEM OF CULTIVATION.

No. III.—A vulgar conclusion is drawn from the visible connexion of plants with the soil, and from the effects its natural fertility and the manures we apply to it have on their development, that they obtain their nutriment solely through their roots; this error is fast giving way before the inquiries of the age, and the knowledge is rapidly gaining upon us that much of the food of plants—more, perhaps, even than Liebig has shown—is taken in by their leaves; and it is upon this mode of receiving their food that the higher productiveness of our rowed crops, no doubt, in a very great degree depends; and it is upon this opinion I found the theory of a wide-row system of grain tillage, for from examination I have found the roots of our Cereals do not extend laterally to the occupation of the spaces between the rows at the distances of 2 feet; while, from observations I have made, I believe at still much wider distances higher returns may be obtained from the rows, and at least equal, if not superior ones, from the acre. It is not, then, to the abstraction of nutritious matters from the spaces by means of the roots of the plants in the rows that their increased productiveness is due, but through their leaves from the air; and these unoccupied spaces are not therefore deprived of any portion of their fertility by the crops in the rows, but are precisely placed in the same condition as land under the process of a naked fallow, and thus they are qualified to bear a grain crop in the succeeding year. I have on examination found the roots of Cereals sown in wide rows, descend in a columnar form, and not extending above six inches laterally.

It is a property of all projectiles that they are propelled in right (straight) lines; the air is so propelled, and whatever tends to divert its current from a right line tends to diminish its force, following the natural law of projectiles. Repeated checks or divergements at length stop it altogether, and it then stagnates; this is the case more or less with a broadcast crop, the grain promiscuously spread over the surface sends up stems which break and check the currents of air. In a rowed crop these breaks or checks do not occur, the air runs freely along the spaces between the rows. Now, the air is charged with carbonic acid and ammonia, both essential constituents of vegetables, as also with some, perhaps many, of their inorganic elements. It is admitted that for many miles inland the salt of the ocean is carried by the air. Liebig says: "By the continual evaporation of the sea, its salts are spread over the whole surface of the earth; and being subsequently carried down by the rain, furnish to the vegetation those salts necessary to its existence. This is the origin of the salts found in the ashes of plants, in those cases where the soil could not have yielded them." And again. "The experiments instituted under Lavoisier's guidance, by the *Direction des Pondres et Saltpetres*, have proved that during the evaporation of the saltpetre ley, the salt volatilises with the water, and causes a loss which could not before be explained. It is known also that in sea storms leaves of plants in the direction of the wind are covered with crystals of salt, even at the distance of from 20 to 30 miles from the sea. But it does not require a storm to cause the volatilisation of the salt, for the air hanging over the sea always contains enough of the substance to make a solution of nitrate of silver turbid, and every breeze must carry this away. Now, as thousands of tons of sea-water annually evaporate into the atmosphere, a corresponding quantity of the salts dissolved in it, viz., of common salt, chloride of potassium, magnesia, and the remaining constituents of the sea-water, will be conveyed by wind to the land. This volatilisation is a source of loss in salt works, where the proportion of salt in the water is not large."

If, then, the air is so charged with these matters it becomes evident that the more continuous, the less interrupted is the stream of fresh air among plants, the more regularly and abundantly they must be supplied with them. On the contrary, when the air stagnates about them they soon use up these matters and then lack food; they are in the position of animals shut up in a close place, from which the air is excluded—they become surrounded by a noxious atmosphere, one indeed o ftheir excrements.

Every one knows how injurious to grain crops are hedgerows or anything that obstructs the free passage of air and light, yet we are so blinded by the habit of crowding our cereal plants, that few will see in the same light the obstruction which the plants themselves cause, or to admit the beneficial effects that must result from affording plants an abundance of both, by that full access of them which wide rows permit.

Most farmers are now convinced that a drilled crop of Turnips is more yielding than a broadcast one. Why should not a grain crop be so? A drilled crop of Turnips affords facilities for cleaning land. Will not a grain crop afford equal ones? I say it will, and preferable ones, in all except that which the later seed-time of Turnips admit of; for, from its upright growth it will admit of working the land to a later period, indeed to the period of its blossoming, and before its removal the autumnal growth of weeds will not have had the time to reach that strength which they arrive at in a Turnip crop. But the fact is, the perpetual fallow which I suggest would eradicate all weeds from the soil, and even our dunghills would no longer furnish their seeds, and the strength of our soils, and of our manures, would be given to the production of the crops we cultivate.

But I do not propose, with Tull, that a perpetual fallow should wholly supersede the application of manures; for, great as may be the fertility induced, and active as the soil may be rendered, and large as may be the amount of vegetable food derived from the air through our mechanical operations, yet the introduction of foreign matters containing the organic food of plants will further stimulate the soil by promoting changes in its inorganic elements. Their immediate effects will be exerted on the crop to which they are applied, and their more economical use will be to promote the early growth of plants, by placing them near the seeds or roots; and I should therefore prefer an annual application in small dozes to a proportionally heavier one once or twice in the course. The greater abnormal productiveness of our crops depends much on our promoting an extraordinary growth from the earliest periods of their existence: "A maximum of produce in plants is always in proportion to the quantity of nutriment supplied to them in the first stage of their development."—*Liebig*. It is in the early growth that the size and strength of a plant, as of an animal, is ordinarily decided; as well might we expect a noble-sized ox from a starveling calf, as a strong plant from a starved seedling. In thin-seeded ground and on the wide-rowed system this requires to be more strictly attended to than in the broadcast sowings, for we depend on the strength of the plant to compensate for the numerical deficiency. It is also in the earliest stages of their growth that we can most assuredly administer assistance in the immediate application of manure, for all but the lateral fibres of their roots very soon strike down beyond the reach of our recently applied manures; by the time the Turnip has attained its rough leaf, its root has descended a foot or more below the surface; the root of a young Oak a foot high is said to descend 4 feet into the ground; and under favourable circumstances, the roots of our grain crops, M'Arthur says descend farther below the surface than their stems ascend above it. In their after-growth there can be no doubt that plants depend more for their nutriment upon the natural qualities of the land or the state into which the soil has been brought by former manipulations and manurings, and upon the air and the matters floating in it, both, I believe, as they exhale from the earth, and again as they descend to it. The exhalations from the earth are promoted by our mechanical operations; every time we move the soil changes take place, decompositions are effected, and new combinations made; these chemical actions generate heat and gases are evolved, which in their escape must be taken in by the leaves of plants. That gases do so escape from freshly moved earth we all know, for our noses make us acquainted with them; all have remarked the peculiar odour of newly-turned clay. Its health-inspiring perfume has become proverbial.

It is time I should close this subject for the present, and I fear in my anxiety to press on the attention of the farming community a system which, I believe, will enable the man of small capital to meet the present depression in the market I have trespassed too much on the patience of all, and tired out that of many; I will now then only say that what I have pressed upon them I have practised with success in small desultory experiments through a space of 30 years, and that very many untoward circumstances, arising in a great measure from my position in society, have alone prevented my pursuing it extensively. I hope, however, next harvest to lay before the readers of the *Agricultural Gazette* the balance-sheet of some few acres cultivated on this plan; and in the meanwhile I will endeavour to amuse them with details of my proceedings. My means are as humble as most of theirs. I seek to live by my labour, and I am not therefore either a mere amateur or a wealthy speculator. I am but a poor retired Lieutenant of our Peninsular army. What I do, then, any farmer may attempt. *J. M. Goodiff, Granard, Feb.* 14.

## ON THE ACTION OF THE FINER PARTICLES OF EARTHY MATTER ON VEGETATION.

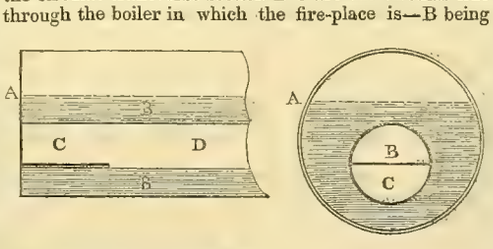
[Translated from the German of the late PROFESSOR SCHUBLER, of the University of Tübingen.]

I. SILICA (or the pure earth of sand, flint, &c.)—We find among the component parts of many plants a certain portion of silica; this is particularly the case in the haulms of several Grasses and the varieties of the Reed; proportionally less in the ashes of wood of various kinds. Saussure and Berthier invariably found, in their investigations into the nature of the ashes of a great number of plants, a certain amount of silica, but in very different proportions; its amount, even in the same plants was ascertained to be very various, according to their different development and their different organs. Saussure found in 100 parts of the ashes of Barley-straw, 57 parts of silica, and in 100 parts of the ashes of Wheat-straw, 61½ parts of the same earth; while the ashes of the ripe grain of the latter plant contained only one-half per cent. of silica. In the ashes of Oak-leaves in May, he found 3 per cent, and in September, 14½ per

cent. of the same earth. In the wood of the Oak, on the contrary, he detected only 2 per cent., while in the sap-wood of the same Oak he obtained 7½ per cent. Similar variations were found in several other plants. It is, therefore, probable, that the presence of silica is not of equal importance for the perfect cultivation of many plants, and that in reality it is more frequently absorbed in its soluble forms by the roots of plants, as has been commonly supposed to be the case. In its insoluble state in water, as it is very frequently found in soils, it contributes much to give the plants a suitable habitat or standing-place in the ground, and thus acts, by means of its physical properties, very beneficially on the soil, giving to it the lightness requisite for vegetation. It obviously follows, from these circumstances, how requisite it is, in the analysis of soils, to distinguish from each other the various forms of the silica under which it occurs in land; as, in the form of sand, it communicates to the soil, both chemically and physically, quite different properties from what it does when occurring in land in its finely divided state, either free or in combination with alumina (or pure earth of clay). Old analyses of soils, even made by distinguished chemists, in which merely the amount of the silica in the soil is given in general terms, without a particular statement of its different forms of occurrence, have often, on this account, very little value in an agricultural point of view.

II. Alumina (or the pure earth of clay).—Alumina appears to pass over into the mixture of the juices of plants much more rarely than silica. Berthier could find no trace of it in the ashes of 28 different kinds of wood that he investigated, although this earth was found to be often contained in large quantities by the soil in which the trees furnishing those specimens of wood had been grown. Saussure also found, in the course of his investigations into the nature of the ashes of several plants, that alumina very seldom occurred in them, and much more rarely than silica, lime, and magnesia: this confirms the correctness of the opinion, that alumina occurs in land but seldom in a state of solution. Notwithstanding this little tendency to solubility, alumina, in consequence of its physical properties, forms one of the more essential ingredients of the soil, and is of great importance to vegetation. In its combination with silica, as clay, it has the property of giving to land the proper consistence; of attracting to itself hydroscopically the moisture of the air in a higher degree than other earths; of absorbing in this moistened state the oxygen of the atmosphere; and of collecting within itself, and combining the particles of humus in greater amount than is effected by other ingredients of the soil.

Clay consists of an intimate combination of alumina and silica, with more or less oxide of iron, and here and there also with a small proportion of the oxide of manganese. The combination of these substances is commonly so intimate that diluted acids have not the power to disturb it; but sulphuric acid, allowed to act on them for a longer time at a boiling heat, dissolves the alumina and the metallic oxides, while the silica remains undissolved. Clay is generally mixed up with several per centages of finely-divided sand and fine silica, which may be separated from it, before its analysis, by repeated boiling with water and careful decantation. Pure clay does not effervesce with acids; diffuses, when breathed upon in a dry state, a strong earthy odour; adheres to the tongue, quickly absorbs water, oils, and fatty substances; it remains for a certain time lightly suspended in water, which it renders muddy, but from which it perfectly separates again, by subsidence, when left at rest. Of this water it retains, in its finer state, from 70 to 71 per cent., without allowing it to drop away from it; in a compact and moderately moistened state water penetrates but slowly into its interstices; it dries up slowly, and in so doing shrinks into a smaller space, leaving many cracks and fissures throughout its substance; it readily takes up humus and humic acid in considerable quantities, which seem to combine with it, partly in a chemical manner, and partly through adhesion in a physical one, in consequence of which it remains for a long time fertile, after it has been once properly penetrated by humus-particles and other earths, which communicate to it the requisite lightness for cultivation. In the wet state it forms land of a very tenacious character, and difficult to work, indicating a great adhesion to the field-implements employed; when dried up, it is hard and can scarcely be penetrated by the implements or the roots of plants; in this purer form, therefore, it is unsuitable for vegetation. By means of frost, and through freezings in the wet state, its consistence is much improved; it becomes in consequence much lighter, the water contained within its interstices becoming crystallised, and rending asunder the particles of the clay by its expansion; but it easily loses this lightness again when worked in a wet state. On exposure to a red-heat it permanently changes its properties, its whole nature becomes altered, it generally obtains, by a higher degree of oxidation of its oxide of iron, a deeper, and often red colour, its power of retaining water being considerably diminished; it can now be retained in suspension by water only to a small amount; it has lost, to a considerable extent, its great adhesion to field-implements, and the properties of a tenacious heavy clay, forming a soil more nearly approaching to a light, dry, sandy soil. The alumina and silica have become changed, by the red-heat, into a half-vitrified state, similar to that of burnt brick. Clay is not always composed of silica, alumina, and oxide of iron in the same proportions: silica, indeed, constantly forms the principal ingredient, but its amount varies several per centages, as the following analyses of several kinds of clay will show.



| Kinds of Clay. | Silica. | Alumina. | Oxide of Iron. | Chemists. |
|---|---|---|---|---|
| White pipe-clay ... | 63.0 | 37.0 | ... | Kirwan. |
| Grey potter's-clay ... | 60.0 | 40.0 | ... | Vauquelin. |
| White potter's-clay of Abondant ..... | 58.8 | 41.2 | ... | Berthier. |
| White clay of Reuhausen in the Jura limestone ... | 56.3 | 38.6 | 4.9 | Chr. Gmelin. |
| Brown clay of Arcueil, near Paris | 63.0 | 32.0 | 4.0 | Gazeran. |
| Grey potter's-clay of Tillendorf..... | 68.5 | 30.3 | 1.1 | Klaproth. |
| Dark-grey clay of Hofwyl ..... ... | 58.0 | 36.2 | 5.8 | Schübler. |
| Red clay of the keuper-formation | 62.3 | 27.8 | 7.9 | Schübler. |
| Average of the last five Analyses ... | 61.6 | 32.9 | 4.6 | |

In the three first analyses, the oxide of iron was probably not separated from the alumina. We may therefore assume, on the average, that clay is composed of 62 per cent. of silica and 32 per cent. of alumina, with a few per centages of oxide of iron. In the foregoing analyses no statement is made of the incidental ingredients of clay, which are often contained in it as accidentally mixed particles; these, besides sand, consist often of lime and magnesia, with strongly combined water: the amount of water in clay, which has been merely dried in the open air, amounts to 6, 8, 10, to 14 per cent., and is only driven off by exposure of the clay to a red-heat. The various colours of the varieties of clay deserve mentioning. They are occasioned most frequently by iron in different stages of oxidation, and often also partially by carbonised vegetable remains. The greenish and blueish colours result generally from the hydrated protoxide of iron, the brown ones from protoxide of iron; the red from peroxide of iron; and the yellow from hydrated oxide of iron; the black colour of clay is often occasioned by much carbonised humus-particles, and sometimes also by the admixture of oxide of manganese. The white clays contain commonly the least admixture; they are capable, however, of containing several per centages of hydrated protoxide of iron without its being at once detected by the colour. The varieties of clay are known under different denominations, according as they more nearly approach to the pure rich clay, or contain intermixed with them a variable quantity of fine sand. Crome was the first who proposed definite terms for these varieties, which we here retain. To prevent confusion, as these varieties are not known to the cultivator in every district in Germany, under the same terms, we will define each kind more closely. The rich, or fat clay is that which approaches most nearly to clay in its pure state; we understand by it, a clay, from which, by boiling and decantation, an amount of from 5 to 15, that is, an average of 10 per cent., of sand, may be separated: to this variety belong many of the pottery clays, the colours of which are as various as those of pure clay. It forms a very heavy soil, capable of absorbing about 60 per cent. of water into its interstices; in order to give to it the lightness requisite for agricultural purposes, from 20 to 30 per cent. at least, of coarse sand, are necessary; if the proportion of the coarser sand is raised from 30 to 50 per cent., so that the quantity of the sand is about equal to that of the rich clay itself, a very good mixture of soil is formed, which has neither too strong nor too small a consistence for field operations. When the proportion of the coarse sand, however, amounts to 60 and 70 per cent., the soil assumes the properties of a sandy soil. Clay-lands are very much improved in value when they contain a few per-centages of carbonate of lime, or chalk. Loamy clay differs from pure clay in the greater amount of sand it contains; we understand by this term, a clay, out of which, by boiling and decantation, may be separated from 16 to 30 per cent., or on an average of 24 per cent., of fine sand: it has less tenacity and lubricity, and a smaller amount of cohesion, than rich clay; it takes up about 50 per cent. of water; it shrinks less on drying than rich clay. By proper admixture with sand, humus, and lime, it becomes converted, more easily than rich clay, into a fertile soil. The 24 per cent. of fine sand already contained in it, are, in reference to its influence on the lightness of the soil, at least equivalent to 15 per cent. of coarser sand. By the poor or hungry clays, we understand, in agricultural works, and in many provinces of Germany, the poorest clays, which contain from 30 to 60 per cent., or on an average 45 per cent. of fine sand, mixed with them. Through their great amount of sand and silica, they have little tenacity and cohesion, take up only 40 per cent. of water, and dry in the air without any considerable change of volume. They already possess so much looseness, that no further addition of sand is necessary to render them capable of cultivation; they are often liable to suffer for want of sufficient moisture. In the language of miners, and in common discourse, on the contrary, a loamy clay is often understood to signify a very rich clay, which most nearly approaches to pure clay.

## Home Correspondence.

*Sheep folded on Grass.*—I have lost several ewes within the last two months, they have been in a good pasture field in the day, and folded on a part of the same field at night, and have had a supply of Turnips, and about ½ lb. of Beans each daily. The greatest part of the field was covered well over with farm-yard manure in December, and my man thinks that this is the cause of their dying as they do, suddenly; what is your opinion on this subject? *Oldham.* [We do not consider the cause you suppose as by any means probable. The nature and cause of the disease can be best ascertained by examining the body carefully after death. *W. C. S.*]

*Management of Steam Engines.*—The following cuts should have been published with "W.'s" paper on this subject. They are a transverse and longitudinal section of the Cornish boiler. In both A is the water-line; in the circular transverse section B C are the circular flue through the boiler in which the fire-place is—B being

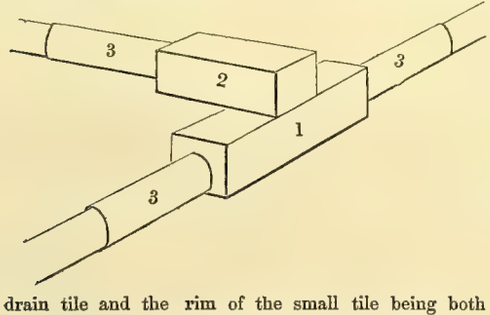
the fire and C the ash-pit, the line between them occupying the position of the fire bars. In the longitudinal section B is the ash-pit, C D the fire-place, C being the "dead plate" on which the coal is gradually heated for burning at D. Below B the cut should have given the section of that portion of the boiler below the ash-pit.

*Case of "The Skylark;" a Demurrer, and Motion for a New Trial.*—When a man has a friend whom he dearly loves, how natural is it for him to plead earnestly in his friend's behalf when he hears him spoken against—particularly when he is, or is supposed to be, innocent of the crime laid to his charge! In this latter belief, I confess I recently espoused the cause of the hapless skylark, imagining him to be guiltless of chewing the cud of the young germinating Wheat, Peas, &c.,—at all events with so alarming an appetite, clearly indicative of his having what we English call "the wolf" in his stomach. Since, however, "A Shilmalier" returns to the charge with redoubled energy, and with multiplied grievances, and is now moreover backed by another highly respectable "witness," Mr. J. Foreman, of Montrose,—the "trial" assumes some importance. It is now "Ireland and Scotland *v.* England," with heavy odds against the latter. Unfortunately I, who represent in my humble person this "Land of the Brave," am at present unable to "prove my case." I am no farmer; never followed the plough; never detected, never read, never heard of skylarks living in spring-time on salads of delicate, succulent Wheat-grass; never fired at nor shot these "rogues in grain," when so detected; nor disembowelled them afterwards to find "damning proof" concealed within, to tell of such moral guilt. All I can conscientiously do, therefore, is to speak what I know of their general character; of the "high" position they hold in the world at large,—I have already done so; and to throw myself on the mercy of the court. However, *sub judice adhuc lis est. Two* witnesses only have appeared; and they represent Scotland and Ireland. I have advocated, as yet, the cause of the English Lark, believing him honest, and like the rook—the farmer's best of friends. Let but a respectable witness for *England* appear against me, and the verdict, alas! must be for the plaintiffs. I hope, however, it will not be with "immediate execution," but that "judgment may be respited until next term" (the larks,—many of them, I fear, will be spitted, by your two zealously-affected correspondents, before they are respited by the judges.) "A Shilmalier" and Mr. Foreman are both such pleasant gentlemen, and write so well and so good-naturedly withal, that it is impossible to feel otherwise than friendly towards them, or to gainsay what they so clearly assert. They state their grievances very fairly, and, as Mr. Foreman facetiously remarks, pay perhaps rather "dearly for their *whistle*." But what a whistle! Was ever any whistle heard like unto it? Never! And yet surely the voices of the larks which inhabit the corn-fields of Ireland and Scotland cannot equal those we are accustomed to hear in "merrie England!" Surely not; or a few extra bushels of Wheat—now said by the farmers to be worth nothing—would never be a consideration of importance. The dissentients shall soon hear our English lark, and judge for themselves. "A Shilmalier" hints that he will pay a visit, anon, to our "World's Great Fair;" and that while in our gay city he will honour me with a friendly call. Of course he will. I shall fully expect him, and greet him with a hearty welcome on his arrival. Let Mr. Foreman follow suit in this goodly move; and let us all three, over wine and Walnuts, Pine-apples and sherry cobbler, argue once more, deliberately, humanely, and philosophically, the case of the poor skylark—Heaven's special favourite! Not longer ago than Sunday last, as I stretched far away among the Surrey hills, I saw my *protegé*, crest erect,

> "From his moist cabinet, mount up on high;"

and the music he discoursed was so eloquent, that I thought if "A Shilmalier" was by my side, I could have converted him. Indeed I question, if I read his character aright, whether his "spring crops of Wheat, Rye, Barley, Oats, Beans, Peas, and Vetches," would not, at the time I speak of, have been placed at the free disposal of this merry, innocent rogue, and his associates. Mr. Foreman recommends me to use a good telescope in my rambles, and so "take a sight" of the larks' consumptive habits.* He marvels, too, at my want of ornithological lore; and advises me, by ocular demonstration, to convince myself of what larks *really do eat* in the way of grain. As regards the larks of Scotland, I willingly confess my ignorance, and most readily take his word; but, if you please Mr. F., *pendente lite*, we will let the food of the wild English lark remain an "open question."

*William Kidd, New Road, Hammersmith, May* 1.



*Game.*—In the last Number of the *Agricultural Gazette*, p. 252, is a long article headed "Game," in which the writer, like too many writers and talkers of the present time, anathematises landlords for keeping game on their own lands. Now, I am no sportsman, but I have passed through a pretty long life, and as far as my experience has gone, and it has been of considerable extent, in nineteen cases out of every twenty, game-preservers have made the best landlords I have known, and tenants have done the best under them. There are, or there may be, I admit, some few exceptions to this general rule; but still I maintain that the rule is a general one. I know that it is a very popular subject to rave against landlords; and equally as unpopular a one to write a word, or speak a word in their defence. But is the game in this country generally injurious or beneficial to the cultivators of the lands of it?—this is the question, and I am aware that I shall be condemned by all the apron-string farmers in this country, and by too many who ought to know better, when I pronounce that game preservers, taking them as a body, are great benefactors to land cultivators; and I go further and add, that were landowners to extirpate the game off their lands, instead of preserving it, they would inflict a sore evil on their country. Not, however, be it understood, that I am referring to the money value of game, or of its forming an article of luxury for the tables of the wealthy; but I am referring to the real benefit that game confers upon the cultivators of the soil, and to that only. With these few remarks, Mr. Editor, I close this subject for the present; but should any of your correspondents like to discuss it further with me, and will

* I am indeed glad that this question has been broached. It will tend to throw a light on a dark subject, not yet fathomed. *Veritas in puteo.* Larks have hitherto been regarded by bird-fanciers and naturalists as *soft*-billed birds,—*not* granivorous; and when caged, have been fed accordingly. Yet have they thriven marvellously! How *is* this?

append their names to what they shall write ; and if you, also, will be so kind as to cause our correspondence to be inserted in your Journal, I will undertake to prove, to the satisfaction of many of the intelligent readers of it, that it would be more repugnant to common sense, or more repugnant to sound wisdom, for landlords to destroy, than it is for them to preserve game on their estates. *Geo. Wilkins, April* 21. [We insert this letter because we think it would be for the advantage of both owners and cultivators of land, if the agricultural aspect of the game question were to be temperately discussed.]

*The Guano Trade.*—Accuracy in matters of fact is, I agree with you, indispensable in this as in any other question in which exactness is obtainable. That I had good grounds for stating the present freight of guano at "about 3*l.* a ton," the following extract from a letter I received in the beginning of this month, from the commander of a first-class English barque, will show. The letter is dated Valparaiso, Jan. 24, 1851. "I have chartered the Malcolm, at 3*l.* 5*s.*, to load at the Chinca Islands, a cargo of guano, and call at Cork for orders. This is the best charter I could obtain. I was recommended to fix the ship, and now find ships of our same class going the same round at 3*l.*, as you will see by the English papers." The definition of the word monopoly, given by Johnson, is "the exclusive privilege of selling any commodity ;" and if that is not what Messrs. Gibbs and Sons claim by their advertisement, I do not understand its meaning. But I did not use the term in an obnoxious sense, nor did I apply it to Messrs. Gibbs, except as the agents of the Peruvian Government. The question for the farmers to consider is, can guano be got on cheaper terms? I am told by several shipmasters who have traded it at the islands, that the supply appeared to them nearly inexhaustible. If this is really the case it would certainly be for the interest of the Peruvian Government to open the trade. The consumption of the article in this country might be greatly increased by lowering the price ; and the Peruvian Government, by selling 200,000 tons in a year, at 3*l.* a ton, would obtain a larger revenue than from 100,000 tons at 4*l.* The two classes in this country, from which all protection has recently been withdrawn, the agricultural and shipping interests, are those which would benefit most by this change ; and it is a matter of sufficient importance, in my opinion, to suggest the Foreign Secretary's interposition. The opening of a trade which would double the employment of our fine ships suitable to the west coast voyages, and at the same time enable our farmers to grow larger crops at less expense, is surely worthy of the consideration of Government. *James Caird, Baldoon, April* 28.

*Suggestion for Draining Tiles, to be used only at the union of the small and main Drains.*—1. The large tile, after passing the machine, will require a circular hole being cut in the centre of it, large enough to receive the rim of the small tile. 2. The smaller square tile will require a circular hole cut near one end, large enough to discharge the quantity of water it can carry, with a rim round the hole, to keep it secure in its place, and that end must be stopped. The opening in the main

drain tile and the rim of the small tile being both circular, it will be immaterial at what angle the drains meet. 3. It is suggested that a sufficient quantity of the tiles should be cut in two by the maker, of various lengths, to avoid the necessity of breaking a tile, so that any length required at the union of the main and small drains may always be ready for use. 4. It will be observed that by this mode of uniting the drains, the small drain deposits its contents into the main drain, the capacity of which is not diminished in its union with the smaller drain. *W. Hewetson, Farnborough.*

*The Pruning of Hedgerow Timber.*—Let me (through the medium of your excellent Paper) call the attention of landlords to a custom which is rapidly gaining ground in several parts of the country, tending to the injury of property and the disfigurement of the country, which is more annoying to me than the wanton manner in which timber is sometimes trimmed, being a mere whip ; it is evident that timber thus served is ruined. A paper read at a farmers' club by a Mr. Oliver, and reported in your last Number, has reminded me of this subject. He suggests that the landlords should pay the tenants rent for the timber grown on the farm ! His next proposition will be that the landlord shall pay the rent of the farm to the tenant. He talks of the antiquity of leases ; I will answer for it the growing of timber is as old as the oldest lease. Was Mr. Oliver wide awake when he took his farm ? Did he not see timber growing on it ? Did he remonstrate ? if not, what right has he to find fault with any one but himself ? I am no advocate for a superabundance of timber, but a clearance would be injurious, even to the tenant. I would urge on landlords the necessity of looking to the subject. I advise their cutting down all ill-growing, useless timber, particularly pollards, and then not allow a stick to be touched, and to introduce a special clause in the lease or agreement to that effect ; this is as much as any reasonable tenant ought to expect. *H. B. M.*

*The County Census of* 1851.—Singularly enough, by the schedules of the new census, landlords or landed proprietors are not asked if they farm their own property ; admirals, colonels, captains, esquires, now-a-days' farm, some their own property, others, as occupiers ; none of these questions are put to them as are put to occupiers of land, *only* who are to *call* themselves "farmers," put their sons and daughters down as "farmer's son," and "farmer's daughter." What would the fine ladies of silks and fur-belows say to such denomination ? or the son M.A., of independent fortune ? Again, no questions are asked if *all* the children are legitimate ? In every parish a certain number are born out of wedlock. But this schedule does not ask the question ! Every lady who is shy of telling her age, and those who say they have the privilege of deducting three years from the sum total of their years of existence, are told if they tell not their age truly, two justices of the peace will make them, and fine them to boot five pounds ! Most courteous legislators ! most polite justices ! It would have been a very interesting fact to have learned by this census the number of gentlemen born who are as a pleasure, recreation, or profit, farming land. I believe at this moment the number so doing, both of members of the church, of the army, and navy, is very great ; and a vulgar prejudice exists against such intelligent men doing so, the argument being, they are driving out and preventing a certain class of men from getting a livelihood as "tenants ;" an absurd complaint. *Q. R. S., Hants.*

## Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Weekly Council was held at the Society's House in Hanover-square, on Wednesday last, the 30th of April: present, Mr. Raymond Barker, V.P., in the chair, Lord Berners, Don D. Savignon, Mr. Brandreth, Mr. Brooks, Mr. Burke, Mr. Burton, Mr. W. G. Cavendish, M.P., Mr. Clavering, Mr. Cobon, Mr. Davy, Mr. Flack, Mr. Gadesden, Mr. Garret, Mr. Gooch, M.P., Mr. Fisher Hobbs, Mr. Majendie, Mr. Milward, Mr. C. E. Overman, Mr. Parkins, Mr. Pendarves, M.P., Mr. Rowlandson, Professor Sewell, Mr. Stansfield, M.P., Mr. Stephens, Mr. Stone, Professor Way, and Mr. Wolryche Whitmore.

The following new members were elected :—
Hollwey, M. de Bethman, Prussian Legation, London.
Bolton, Lord, Hackwood Hale, Basingstoke, Hants.
Lutener, Thomas, Dolerw, Newtown, Montgomeryshire.
York, James, M.D., Wharncliffe-house, St. John's-wood.
Ferard, Charles Cotton, Ascot place, Winkfield, Berkshire.

The names of 12 candidates for election at the next meeting were then read.

The following were among the presents made to the Society : the Transactions of the Yorkshire Agricultural Society, (containing an interesting series of experiments with coprolites, peat charcoal, &c., as manure for Turnips) ; Mr. Tanner Davy's Prize Essay on the Management of Farm-yard Manure ; Proceedings of the Royal Institution of Great Britain ; Transactions of the Horticultural Society, the Statistical Society, the Entomological Society, the Highland and Agricultural Society of Scotland, and the Royal Jersey Society ; the Farmers' Magazine ; Mr. Lee's Report (through Mr. Chadwick) on the application of Sewerage Water to Irrigation and Agriculture ; and M. Desplanques' "Exposé sur l'Industrie de la Laine" : for which the Council ordered their usual acknowledgments to the respective donors for their attention to the Society in offering these donations.

The Council then adjourned to Wednesday, the 7th of May.

## Farmers' Clubs.

St. Germans, *Feb.* 14.—Mr. Peters read the following paper :—*On the importance of a proper arrangement of Farm Buildings, with the application of requisite Machinery for economically carrying on the work of the Farm.*

The investigation of my subject naturally divides itself into two branches—

1st.—The consideration of the loss sustained from old, deficient, and badly arranged buildings, *without proper machinery.*

And 2nd.—The advantages derivable from sufficient accommodation, and proper arrangement, *with requisite machinery.*

There are a few general rules or principles in regard to the arrangement of known necessary integral parts of farm buildings, which may be laid down as axioms.

1. The dwelling-house in my opinion should be at such a distance from the yard and other buildings as to leave a free, clear space for air, and healthful sweetness, around the dwelling of the farmer. I know this view is opposed to that of a noble lord who wrote on this subject (Lord Torrington), who advocated its being placed in the midst of the dung and cattle houses, that a supervision might go on from *the windows.* With all due deference to such high authority, I would say, a fig for your "*from the window*" superintendence. The farmer requires to be on the spot, here, there, and everywhere, (the idea was certainly calculated to bring them as near "*their own oxen*" as possible.)—Another thing is, that I never admired the mingling of house domestics amongst the duties of those properly belonging to the farm yard. In very small holdings, where the occupier or farmers' own family, do most of the work, the case may be something different.

2d. The farm stable and implement shed should be as contiguous as possible, and with free access from the yard, towards the principal thoroughfare to the farm, or public road—without the incumbrance of a gate from the yard (except where a turnpike road happened to pass close by). No loose cattle or pigs to be in the way of either horses or carriage, to interrupt the free ingress or egress, water for the horses to be immediately adjoining the stable.

3. The corn barn and granary should be contiguous, with in-door communication one with the other,—the straw to be thrown into the straw house or straw store, by the threshing machine, and the corn delivered into a room by itself ; indeed everything so arranged, that the moment the threshing is stopped, the grain could be secured by lock and key ; every thing being in its own place, trampling and treading amongst the threshed corn would thus be avoided. The stack-yard or mow-hay, as a matter of course, to be as contiguous to the barn as possible.

4. The houses for feeding bullocks to be situated so that a direct communication can be had from the straw house. This may be said to be a matter of indifference if the system of littering straw were discontinued, according to the present arrangements of Messrs. Huxtable and Mechi ; but so evanescent have their plans been hitherto, that we are not sure whether the boarding, and the foul air, may not give way by another year, to the palace of glass and means of removing the putrefactive mass, beyond the reach of the atmosphere inspired by the animals ; and in regard to straw for bedding, we are well aware that it is a non-conductor of heat, and hence if it should not directly convey heat it does not extract it, and will therefore tend to sustain life, and contribute in no little degree to the fattening and thriving of the animals comfortably bedded with it.

5. The accommodation for dairy cows ought to be as contiguous to the dwelling-house as convenient, and, if, at the same time, access to a Grass meadow or meadows can be obtained so much the better ; access through the same means ought to be had to the apartment devoted to rearing calves ; this again to communicate with a steaming or cooking house for food.

6. Young or store bullocks should be placed in houses, boxes, or sheds accessible to roots and straw, sheltered from the prevailing winds, and especially from draughts or currents.

7. The accommodation for pigs should be contiguous to and accessible from the cooking house, and be placed where the sun can shine as much as possible on them. If this cannot be accomplished without exposure to the prevailing winds of the neighbourhood, I see no reason why one side of the roof should not be glazed. A most important addition to the piggery, would be one or two apartments contiguous to the steaming house for lying-in wards, fitted with an apparatus for heating them with hot water—this may look like one of those schemes of "*farming run mad*" that are so common. When visiting the propagating houses and nursery of my friend Mr. Pontey, in Plymouth, the other day, I could not help in my own mind, contrasting the care, the anxiety, the knowledge brought to bear in the propagation of those beautiful little exotics,—the temperature to a degree requisite for their healthful development, the giving air, &c.,—with the bungling, careless, heedless, nay ignorant treatment of our domestic animals when young and by nature tender ; althoughthey are subject to as immutable laws as these plants, and would no doubt repay the diligent care and study of their natural habits and wants.—I do think if our young farmers would devote a day to the inspection not only of the nursery but of the manner of husbanding up manure by friend Pontey, it would teach them a valuable lesson of attention and perseverance which, if carried to the farm and farm-yard, would be a great acquisition.

8. Poultry, if it could be so arranged, should have a place by themselves apart from the farm-yard in some quiet sheltered corner, where certain other little offices are concentrated, such as hackney stable, gig-house, ash-house, &c., more immediately in connection with family comforts.

Having laid down those general rules, Mr. Peters then referred to and explained his illustrative sketches, in order more clearly to show the disadvantages attendant on bad arrangement of farm buildings ; and stated, concerning the farm to which his illustrations referred, it was in the north of Cornwall—its extent was 207 acres ; rent 206*l.* ; rates and taxes 30*l.* ; and that, in consequence of the inadequacy of its farm buildings there had been incurred a yearly loss equal to 25 per cent. on the rental on threshing alone ; while the total loss was equal to 50 per cent. By an expenditure of 400*l.* for buildings and machinery additional to what was previous on the farm, the accommodation was rendered complete.

## Notices of Books.

1. *The Dorking Fowl : Hints for its Management and Feeding for the Table.* By John Baily, Poulterer. London, pp. 39.
2. *The American Poultry-Book ; being a Practical Treatise on the Management of Domestic Poultry.* By Micaiah R. Cock. New York : Harper and Brothers. 1844, pp. 179.

Those who have enjoyed the privilege of dining at good tables in London—and those who have not are greatly to be condoled with—must have observed (especially if they have had the pleasure of visiting the same families in the country) the immense difference between the poultry set before the same class of people in town and

in the provinces, respectively. As to respective merits, tastes may differ; but the things themselves are extremely unlike. The town birds are mostly too luscious for rustic eaters, and barn-door fowls are always too dry for the Londoners. Still many country people would like to bring their fowls up to the metropolitan standard; and at this crisis, Mr. Baily offers his assistance, in the shape of the very sensible and practical little pamphlet now before us. "I believe," he says, "attention to these trifling details will remedy one of the complaints urged against country poultry, viz., that it is too lean."

It will not be fair to transfer the essential portion of his work to these columns, and therefore give, as a specimen, his instructions on the subject of feeding.

"It is too often presumed that little care is required as to their feeding from the time they leave the coop until the time they are put up for fattening. They are allowed the run of the yard, without considering what a precarious subsistence this affords; there may be abundance of food at some periods, and little or none at others. They should be fed regularly, and care should be taken that each of them (for they are all either to be brought up for the table or for stock) shall have a fair share.

"I advise, from the first, to feed the hen and her chickens well, in the following manner:—Instead of throwing down handsful of whole corn, let it be ground and slaked with lukewarm milk, to such consistence that when a ball of it is thrown on the ground it will break and scatter about in particles; if there be green-meat, such as Onion-tops, chopped fine and mixed with it, so much the better. The chickens should be fed in this manner three or four times per day, and the little extra trouble will be amply repaid by their growth and health. As they get older this may be gradually discontinued, and they may feed with the old fowls on whole corn. But even with old birds a change of food is not only advantageous, but necessary; and I would, therefore, advise that once a fortnight the food be changed for a day or two, and boiled or crushed corn substituted for whole. They must also have constant opportunities of pecking among Grass and other herbs. Fowls in confinement will starve and pine to death, with heaps of Barley around them, unless they have these opportunities."—Pp. 14, 15.

An observance of these rules would save us the task of answering many an inquiry in the "Notices to Correspondents." Mr. Baily's treatise is particularly well-timed, as he has the courage to patronise the Dorkings at the very height of the Cochin China mania. "I propose limiting my observations to one particular breed, and for this reason, that there is none to be compared with it. It is the Dorking, and it unites in itself, more than any other, all the properties requisite for supplying the table."—*Preface.* We should like to say a word for the race of Cochins, which are not exhibition birds, but will gladly second any effort to restore the Dorkings to their rightful position. The public ought to know what is the actual intensity of the cock and hen fever at the *present date.* Good Cochin Chinas, likely to be, or to produce show birds, readily sell for two guineas *each*, and upwards. Four pullets sold to a personage of very high rank, were charged at ten pounds. "Nice birds, *but dear!*" observes a gentleman who had the pleasure of contemplating their beauties. An ambitious friend of ours longingly admires a lot of six hens and a cock, for which he would gladly have given 20*l.*, and taken off his hat to their owner, for accepting the offer. To be sure, one of the hens weighed 9¾ lbs. Of course, the dealers are making money in cart-loads, by the means of this epidemic passion for the Cochins. Anything like one is worth almost its weight in gold. The weedings and thinnings from stocks of good repute, are eagerly bought up, to be re-vended in no time. The Cochin China penny is being turned with amazing rapidity. Hens' eggs at 30*s.* the dozen—'tis a fact, gentle reader—will pay for a liberal supply of Barley at present prices; in one case we have heard that the eggs from a certain wonderful pair of fowls realised five shillings each! *Therefore*, Mr. Baily, or any other gentleman, is to be encouraged in his endeavour to bring us back to Dorkings and common sense.

The American work is really a nice little book, worth the perusal of poultry amateurs. It only professes to have originated in an attempt to collect and embody in a methodical form the notices respecting the treatment of poultry in America, scattered through the various periodical publications of that country. It reveals, too, the unexpected information, that the ladies about New York take but little interest in poultry matters.

"In many parts of Europe, the care of the poultry and the rearing of chickens are intrusted exclusively to women; and this seems, indeed, peculiarly within the province of that sex, who are so pre-eminent for their kindness towards the brute creation, and their solicitude for helpless infancy. The writer would fain hope to induce his countrywomen to assume the charge of this department. Their husbands, fathers, or brothers, would soon be shamed out of their present careless and wasteful practices."—*Introduction*, xiv.

One or two little mistakes require to be corrected, such as that the dove-house pigeon sits *fifteen* days; but there still remains much that is good, and well expressed. Take as follows:—

"We come now to the consideration of *water*, which should be plentifully supplied, and of the best quality. Many persons think, because they see fowls helping themselves to dirty water, and that from the stagnant pools in a barn-yard, that the quality of the water is a matter of indifference to them. This is, however, far from being the case; fowls actually do prefer and thrive best on the purest water. From the well known injurious effects of salt, there is great reason to suspect that many of the obscure and unknown diseases of poultry may be attributed to the saline ingredients contained in the water of a dung-heap. They do not partake of this water unless they have no other; and when there is no watering-trough, it must be brought to them, and the vessel kept constantly full. I have lately adopted a contrivance which I have seen recommended in an agricultural paper, and during the summer I find it to work very well.

"Take a perfectly air-tight barrel, such as has been used for cider or wine, and set it up on end on any suitable platform, or a three-legged stool, about 2½ feet from the ground. A small hole is bored in the bottom just large enough to admit a small wooden or leaden tube; even a long pipe-stem might be employed for this purpose. The tube should ascend 3 or 4 inches through the bottom, in order to prevent its upper aperture from being choked up by any substances accidentally introduced with the water. The tube descends into any shallow basin or bowl, or trough of wood, earthen, or iron ware. At the top of the barrel there is a hole to pour in the water, and it should be large enough to admit a funnel. The lower opening should be closed while filling, and when filled the upper opening should be carefully closed. Then withdraw the plug from the tube, and the water will gradually trickle down, and last as a reservoir for many weeks. This water-tank can only be used in summer; it would probably burst asunder in a severe frost. The same contrivance on a smaller scale may be found more economical, and quite as useful. It will last more than a fortnight. Take a common glass demijohn, and, having stripped off the wicker covering, fill it with water. Let this be suspended on a suitable frame, with its mouth downward, and immersed in a basin of water beneath. To prevent the fowls from scratching up the dirt around it and soiling the water, the basin or trough should rest on a platform of boards. The object in taking off the wicker covering is to enable us to ascertain when the water is nearly exhausted." Pp. 51—3.

This homely contrivance is exceedingly useful for the yard of the mere commercial poulterer; but a more elegant adaptation of the same principle is the fountain advertised by Mr. Baily. It is neat, occupies little room, can hardly get out of order, and affords a considerable supply of fresh water; and therefore is capitally adapted either to the pheasantry, the ladies' *basse-cour*, or to stand in the entrance hall for the use of the pet lap-dog. The best compliment we can pay these two little books is to state the belief that had they appeared some years ago, they would have been largely drawn upon by the compilers of poultry literature. Mr. Baily would probably have been incased, in his full stature, in some section on the Dorkings, and Micaiah R. Cock would have had the pleasure of seeing half his chapters at least stare out from the pages of more than one rival publication.

† This storm came from south-west, and passed away to north and eastward, and I watched its progress during Thursday forenoon, the rise of the barometer being suspended during its passage.

Dorchester, May 1st. *F. P. B. M.*

(*To be continued.*)

## Miscellaneous.

*Farm Buildings.*—A bill has been brought in by Mr. Cochrane and Mr. Forbes, to extend the provisions of "The Drainage of Lands Act, 1849," to the advance of private money for the erection and repair of farm buildings on lands in Great Britain and Ireland. It proposes to give landlords the power to borrow money for this purpose, provided the sum borrowed under the Act does not exceed 18 months' value of the land in respect of which it is borrowed. Every rent-charge to be granted in respect of money thus borrowed may be made payable for any period exceeding 22 years, but not exceeding 30 years. All buildings erected or improved under the Act must be insured against fire. *From the Builder, April 19.*

*The Birmingham Cattle Show.*—A meeting of the Committee of the Birmingham Cattle Show was held in the committee room of the Town Hall, on Thursday last, the Earl of Aylesford in the chair. A resolution was passed, expressive of the deep regret of the committee for the death of Sir Francis Lawley, and of the loss which the society and the agricultural body had thereby experienced. Lord Lyttelton was nominated as the president for this year, in the room of the late lamented baronet; and we understand that his lordship has courteously expressed his willingness to accept the office. The Prize Lists, which have again undergone a very careful revision, were adopted, and will be immediately issued. The changes in some departments of these lists are designed to carry out still further the principle of classification adopted with so much advantage in the Birmingham Shows; and at the same time the prizes for cattle and sheep have been considerably increased. *Midland Counties Herald.*

## Notices to Correspondents.

CROSS BRED SHEEP: *L S.* The cross between the southdown ram and black-faced ewe has been repeatedly tried in this district, and given up as a total failure. They are the ugliest animals of the sheep kind I ever saw, and are in every respect inferior to the cross between the Leicester ram and black-faced ewe. This latter cross makes a very valuable sheep, while the other, except in the value of the wool, is not equal to the pure black-faced breed. *A. T. W.*

DRAINING TILES: *An Inquirer.* "The balance of public opinion" *is* decidedly in favour of pipes in preference to tiles and soles. We do not yet know the average duration of "perfect drains laid in the best manner," as none such have yet failed.

LAND AGENCY: *Pupil.* Low on Landed Property is a good work, on the principles of the subject. Layton Cooke's work on land valuing is valuable. The value of fat stock by measurement is stated well in a paper in a periodical work of which only 12 monthly parts appeared, entitled "The Plough" (Longman). Strachan's ready reckoners will probably serve your purpose. The first two works are costly.

PAINT: *Brush* asks for the experience of any of our readers regarding Carson's anti-corrosion paint for inside work.

PARALYSIS: *Northwood.* There is no doubt organic disease, and the poor animal may as well be killed. The flesh will not be unwholesome. *W. C. S.*

PHOSPHATES: *J Jephson Rowley.* The annual sale of 100 sheep and 10 cows is equal to the export of about 1800 or 2000 lbs. of bone-dust.

PIGEONS: *Columbarian.* I imagine you did quite wrong in feeding with Indian corn; nor should you give them Wheat. If the malady continues, and it appears likely to do so, get rid of the old stock altogether, and breed from an entirely new stock. This is the only true way of effecting a radical and speedy cure. *W. K.*

POULTRY: *G B.* The best food for young ducks is boiled Rice, mixed with a little Barley-meal and fine pollard, to such a consistency that it is neither sloppy nor sticky—crumbly, in short. A constant supply of water, and slugs and worms at discretion, with good attention and shelter at night, are matters of course.—*Worcestershire Lady.* Your correspondent is a wag, but there is evidence that hens have occasionally laid two eggs a day. You must use your own discretion in ordering a stock of these double-layers from any dealers; some of them might endeavour to suit you.—BANTAMS: *E F.* We cannot account for the hen's laying soft eggs under the circumstances. The evil will, perhaps, cease of itself. Many farmers' wives say that the laying of soft eggs is caused by the hens' being too fat. It is possible that an over-nourished fowl may have a tendency to inflammation, irritability of system, and consequently to abortion.

WILD ONION: *X YZ.* We had a good many in a field, but they have disappeared under the ordinary tillage, and occasional fallow crop. Turnip husbandry will destroy them.

ERRATUM. For "300" square yards, the difference between the English and Irish acre—in page 268, col. *c*, read "3000.'

## Markets.

COVENT GARDEN, MAY 3.

Hothouse Grapes are plentiful and cheap, considering the season. The same remark applies to Strawberries. Good Pine-apples are scarce, as are also dessert Apples. Oranges and Lemons are plentiful. Nuts remain nearly the same as last week. Vegetables of all kinds are abundant and good. French Beans are very plentiful. Some good Green Peas have just made their appearance from Cornwall. Carrots and Turnips are dearer. New Potatoes may be obtained at 4d. to 1s. per lb.; old kinds realise better prices. Lettuces and other salading are sufficient for the demand. The best Mushrooms fetch 1s. 6d. per pottle. Cut flowers consist of Heaths, Pelargoniums, Camellias, Mignonette, Double Primroses, Stephanotis floribunda, Cinerarias, Moss and Provins Roses.

FRUIT.

Pine-apples, per lb., 8s to 12s
Grapes, hothouse, p.lb., 6s to 12s
— Portugal, p.lb., 1s to 2s6d
Strawberries, per oz., 6d to 1s

### POTATOES.—Southwark, April 28.

The Committee report that there were several fresh arrivals from Yorkshire and Scotland the latter part of last week. Trade is so heavy we cannot quote any improvement in prices. The following are the quotations :—York Regents, per ton, 80s. to 100s. ; Scotch do., 70s. to 80s. ; ditto Cups, 60s. to 70s. ; Cambridgeshire and Lincolnshire Regents, 60s. to 80s. ; French whites, 60s. to 70s.

### SMITHFIELD, Monday, April 28.

There is a large supply of Beasts ; the demand is also larger. Prices are higher, and a fair clearance is effected. The number of Sheep is about the same as on Monday last ; the demand is considerably larger than on that day, and consequently prices have advanced. Trade is better for choice Lambs and Calves. From Holland and Germany there are 197 Beasts, 900 Sheep, 92 Calves, and 8 Pigs ; from Norfolk and Suffolk, 2400 Beasts ; and from Scotland, 500.

| Per st. of 8 lbs.—s d | s d | Per st. of 8 lbs.—s d | s d |

| Half-breds ... 4 4 | —4 8 | Calves ... ... 3 4 | —4 4 |
| Ditto Shorn ... 3 10 | —4 2 | Pigs ... ... 2 8 | —3 8 |

Beasts, 3772 ; Sheep and Lambs, 23,300 ; Calves, 169 ; Pigs, 380.

FRIDAY, May 2.

The number of Beasts being large, trade is dull ; however, there is a fair demand and not much reduction. We have a considerable increase in supply of Sheep and Lambs ; trade is heavy at lower rates. Calves are plentiful, and it is difficult to maintain late quotations. From Germany and Holland we have 247 Beasts, 160 Sheep, 301 Calves, and 3 Pigs ; from Scotland, 100 Beasts ; from Norfolk and Suffolk, 500 ; and 104 milch cows from the home counties.

| | | | |

Beasts, 1081 ; Sheep and Lambs, 8730 ; Calves, 484 ; Pigs, 410.

### MARK LANE.

Monday, April 28.—The supply of Wheat to this morning's market from Essex and Kent was in about the same proportion as of late, and pretty well cleared at the prices of this day week, being a decline of about 2s. per qr. on the quotations of this day fortnight. The demand for foreign is limited, and in the sales effected it was necessary to submit to a reduction of 1s. per qr.—Barley and Peas a fair sale at fully late rates.—Beans must be written 1s. per qr. dearer.—Oats are taken readily, at an advance of 6d. per qr.—The Flour trade is heavy, but holders show no disposition to give way in price.

Friday, May 2.—The arrivals of grain this week coastwise are small, those from abroad liberal. The attendance at market was thin, and little disposition shown to transact business ; holders of Wheat, however, evinced no inclination to give way in price from Monday.—Barley is inquired after, and realises fully late rates.—In Beans and Peas there is no alteration.—Oats are in good request at the late advance.—In floating cargoes of Wheat and Maize from the Black Sea or Mediterranean very little doing. Egyptian Wheat on passage finds buyers for Ireland at 23s. 6d. per qr., cost, freight, and insurance.

Liverpool, Tuesday, April 29.—The arrivals from Ireland and coastwise during the week have been insignificant, but from foreign ports supplies have been pretty liberal. The trade has been much depressed, owing to the anxiety of holders of flour to realise before the setting in of hot weather. At this day's market there was the usual attendance of buyers, who, however, showed little disposition to enter into business. Wheat sold slowly at a reduction of 2d. per 70 lbs. on prices of this day week. French flour was offered freely at a further decline of 6d. to 1s. per sack. Oats and Oatmeal were in fair request at an advance of 1d. per 45 lbs., and 3d. to 6d. per load. Barley, Beans, and Peas were without change in value. Indian Corn must be noted 6d. to 1s. per qr. lower.——Friday, April 25.—The corn trade this morning was dull generally. Buyers of Wheat had the turn of price in their favour, and Flour gave way fully 6d per barrel and sack on all second-rate and doubtful quality. Indian Corn also declined 6d. to 1s. per qr., with a small demand.

INDUSTRY and HUMANITY *versus* MURDER and PLUNDER.—Thousands of valuable lives saved by using Marriott's new BEE-HIVE for the humane management of Honey Bees ; its real practical utility is at once apparent Nutt's Collateral, Taylor's Bar and new Box and other Hives for obtaining the fruit of industry without destroying the bees ; a descriptive engraving with priced catalogue of apiarian utensils forwarded on receipt of two penny stamps.—Marriott. Bee-hive and Honey Warehouse, 74, Gracechurch-street, London

BEE HIVES, as shown at the GREAT EXHIBITION of 1851, by Geo. Neighbour and Son, 127, High Holborn, London. No. 1, Nutt's Collateral Hive ; 2, Improved Single Box-Hive ; 3, Taylor's Amateur Bar-Hive ; 5, Neighbour's Improved Cottage Hive, working three or five Glasses ; the Ladies Observatory Hive, &c. &c.

A priced Catalogue, with drawings and particulars, forwarded on receipt of two postage stamps.

Agents. — Liverpool : Wm. Drury, Castle-street. Manchester : Hall and Wilson, 59, King-street. Glasgow : Austin and M'Aslin, 168, Trongate.

BEE HIVES.

MICHAEL HAYS, Apiarian, begs to offer his Improved Hive, as shown at the Great Exhibition, Stand 208 b, which he can confidently recommend as superior to all others. Specimens may be seen in full work at his residence. Also his Single Box and Improved Cottage Hives, working with Glasses, &c., at very moderate prices.—Letters and Orders to be directed, Michael Hays, Beekeeper, Enfield Highway, Middlesex.

M. H. begs to state, that he would have no objection to engage with any Nobleman or Gentleman who may require the services of a Beekeeper and Hive Maker ; and to make himself otherwise useful.

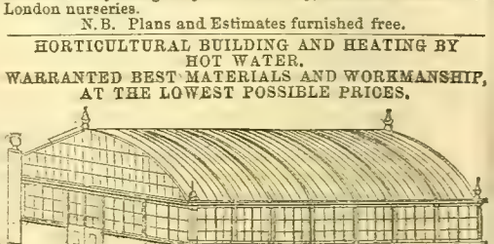
Glass Shades for Ornaments, Sheet and Rough Plate Tiles, Milk Pans, Propagating and Bee Glasses, Lactometers, and all other articles in Glass for Horticultural purposes. Priced List sent on application.

Oils, Colours, Varnishes, Sheet, and White Lead.
87, BISHOPSGATE-STREET, WITHOUT,
Same Side as Eastern Counties Railway.

ENGLISH VERSUS FRENCH GLASS.—The importation of Glass into France is at present prohibited. Special permission has, however, been granted by the French Government for the introduction of a quantity of Hartley's Patent Rough Plate (supplied by Messrs. James Phillips and Co., of 116, Bishopsgate-street Without), for experimental purposes, on the application of some influential horticulturists, who have witnessed the results attained by the use of that article in this country.—*Sunderland Herald, April* 18.

DO YOU BRUISE YOUR OATS?

HORSE KEEP.—Oat Bruisers, Chaff Cutters, Ploughs, 42s. ; Shares, 5s. per dozen ; Rollers, Wheat Mills, Bean Mills, Steam Engines, Scarifiers, Turnip Cutters, Dressing Machines, Drills, Threshing Machines, Wood and Iron Harrows, Steaming Apparatus, Scotch Carts, Hay-making Machines, Horse Hay Rakes, and Drag Mills. First class goods warranted. Mary Wedlake and Co., 118, Fenchurch-street. Most liberal discount for cash. Goods delivered free. On receiving six postage-stamps a list, with 107 engravings, will be sent free.



GRAY and ORMSON, Danvers-street, Chelsea, solicit the attention of the Nobility, Gentry, and Gardeners, to their superior manner of Erecting and Heating, every description of Building connected with Horticulture. The work done by them at the Right Hon. the Earl of Kilmorley's, to which they have had the honour of referring so long, still continues to give perfect satisfaction. Mr. Kinghorn will be happy to show the work and give any information.

They also beg to refer to the houses built by them during the past season, for the Worshipful Apothecaries' Company of London, in their Botanic Garden at Chelsea. Mr. Moore, the Curator, will kindly show the work, and answer any inquiries. They beg also to say the Building only is referred to, as the Heating Apparatus was not erected by them.

Gray and Ormson have also the honour of referring to many of the nobility and gentry in the country, and to several of the London nurseries.

N.B. Plans and Estimates furnished free.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.
WARRANTED BEST MATERIALS AND WORKMANSHIP, AT THE LOWEST POSSIBLE PRICES.

J. WEEKS and CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings ; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. Weeks and Co., King's-road, Chelsea, London.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, BREWERS' USE, &c.
PATENT VULCANISED INDIA RUBBER HOSE-PIPES AND FLEXIBLE GAS TUBING.

JAMES LYNE HANCOCK (sole Licensee and) Manufacturer, Goswell-road, London.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, for portable Gas Lamps, and all purposes where a perfectly sound Waterproof and Flexible Pipe is required. Hot Liquors or Acids do not injure them ; they are, therefore, much used for Chemical purposes, as they require no oil or dressing when out of use—are particularly suitable for Fire Engines, and are found exceedingly useful in dwelling houses for conveying Hot or Cold Water to Baths, &c.

Testimonials and prices may be had on application to the Manufactory.

N.B. Vulcanised India Rubber Garden Hose, fitted up with Roses, Jets, and Branches complete, with union joints ready to attach to pumps or water cisterns.

All Orders or Letters addressed to J. L. Hancock, Goswell-mews, Goswell-road, London, will meet with immediate attention.

Waterproof Fishing Boots and Stockings, Portable India-Rubber Boots, Shower and Sponging Baths, Air Cushions and Beds, made all sizes to order.

ORCHIDS.

THE PROPERTY OF THE LATE GEORGE WALKER, Esq.

MR. J. C. STEVENS is favoured with instructions from the Executors to submit to sale, by Auction, at his Great Room, 38, King-street, Covent-garden, on TUESDAY, 6th May, at 12 for 1 o'clock, the collection of ORCHIDS, removed from Eastwood-hall, Notts. It consists of a general selection of the most popular varieties, many of which are fine specimens, and well established plants.—May be viewed on the morning of sale, and Catalogues had of Mr. J. C. STEVENS, 38, King-street, Covent-garden, London.

TULIPS.

MESSRS. GLENNY AND CO. are instructed to Sell by Auction, on the premises, Hoxton Nursery, New North-road, London, on MONDAY, May 26, at 12 for 1, precisely, 160 Rows of choice TULIPS, being a portion of the superb collection of Mr. Tebbutt. Among others will be found Pandora, Musidora, Louis XVI., Camus des Craix, Fabius, Rose Brilliant, Duke of Devonshire, Violet Alexander, Violet Quarto, Milo, Jackson's Princess Royal, Duc de Bordeaux, &c. May be viewed any time prior to the Sale, and Catalogues had on the premises, at the White Swan, Abbey Mills, West Ham; Cock and Castle, Elizabeth-street, Hackney-road; Victory, Kingsland-road; City of Canton, East-India-road, Poplar; of the Auctioneers, 420, Strand; and at 84, Fleet-street.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

TO BE LET, a HOUSE, with Four Acres of LAND, on the Brighton Railway—Rent, 20*l.*; pleasantly situated, facing the clump of trees adjoining the Horley Station, one hour's distance from London-bridge. An excellent opening for a Market Gardener. The two best rooms, which have French casement windows, would let furnished during the season to pay the rent.—Enquire of the Station Clerk at Horley, who will point out the premises and give the Landlord's address.

FARMS NEAR SUDBURY, SUFFOLK.

TO BE LET, from Michaelmas next, a good Farm of 100 acres, situate in the Stour Valley, at Cornard, within 3 miles of Sudbury. Also another Farm near, of 45 acres, with Cottage, Barn, Stable, &c. Will be let either together or separate. For further particulars apply to Messrs. CHAPMAN, Land Agents, 23, New-street, Spring-gardens, London.

GRASS AND OTHER SEEDS.

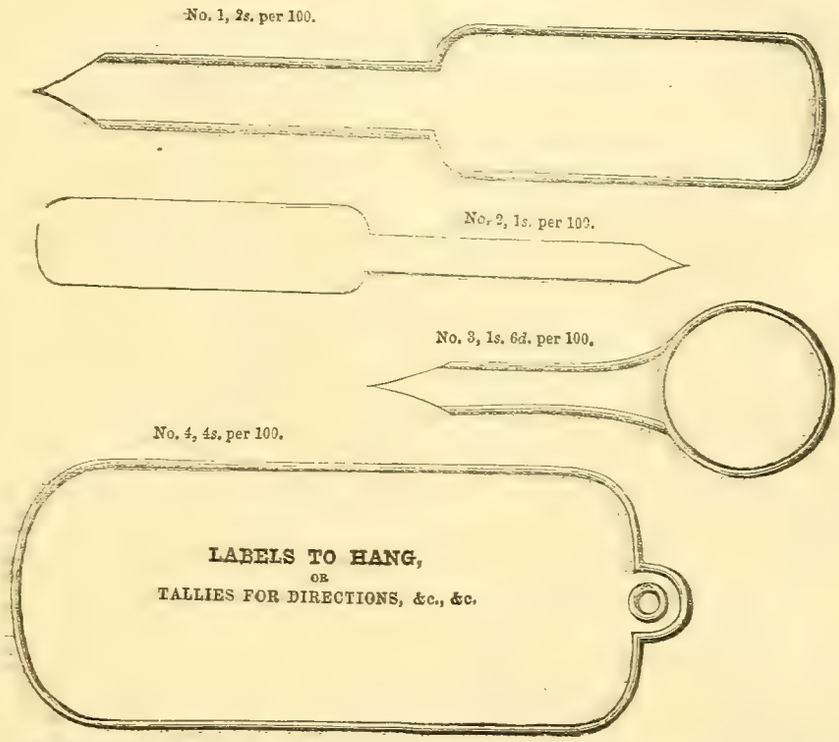
THOMAS GIBBS AND Co., the Seedsmen to the "Royal Agricultural Society of England," corner of **Half Moon-street** Piccadilly, beg to call the attention of their friends to the following Seeds:

Mixtures of selected Natural Grasses for laying down Land to permanent Meadows and Pastures, apportioned to suit the nature of the soil.
Mixtures for portions of Parks near Mansions.
Mixtures for Garden Lawns and Grass Plots.
Mixtures for renovating Old Pasture Land.
Italian and other Rye-grasses.
White Belgian and Red Altringham Carrots.
Gibbs' new very large Parsnip.
Orange Globe Mangold Wurzel.
Long Red and other kinds.
Drumhead and Thousand-headed Cabbages.
Swedes, Hybrids, and other Turnips.
Clovers, Kohl Rabi, French and English Furze.
Sainfoin, Rape, Tares, White Mustard, and all Agricultural and Kitchen Garden Seeds, &c.

Priced Lists are now ready, and will be forwarded free, on application, by post, or otherwise, to corner of **Half Moon-street** Piccadilly, London.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

CUCUMBER and MELON BOXES and LIGHTS.



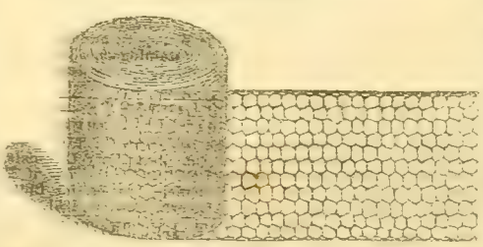
One hundred 1, 2, and 3-light Boxes and Lights of all sizes, ready for immediate use. Warranted best materials, packed and sent to all parts of the kingdom; 2-light Boxes and Lights from 1*l.* 4*s.* Garden Lights of every description, Conservatories, Green and Hot-houses, made and fixed in all parts of the kingdom. References given to the Nobility, Gentry, and the Trade, in most of the counties of England.—JAS. WATTS, Hot-house Builder, Claremont-place, Old Kent-road, London.

BELFAST.

THE IMPROVED FLAX MACHINERY.—Persons wishing to erect Mills for preparing FLAX from the Straw can be supplied with the IMPROVED MACHINERY, recommended by the Royal Flax Society, on application to the Makers, M'ADAM, BROTHERS, and CO., Engineers, Soho Foundry, Belfast.—May, 1851.

THE METALLIC PAINT, produced by the Patent Alkali Company, has been extensively used for several years on farm-buildings, iron bridges, roofs and railings, shipping, &c., and it is admitted that it covers a greater surface and stands far better than any other pigment on wood, iron, Abothaw, Lime, and Roman Cement. Fine Black, 25*l.* per ton, and Rich Purple-brown, 20*l.* per ton.—Offices of the Company, 1, New Broad-street, London.—JOHN A. WEST, Secretary.

# INDESTRUCTIBLE GARDEN LABELS AND INDELIBLE JET BLACK INK.



These LABELS can be written upon either with a Lead Pencil, on *wet* paint (same as on wood), or the INDELIBLE INK, which is unaffected by any weather or climate, and can only be removed by rubbing the surface with sand paper, or other rough substance. Many advantages belong to these Labels, in addition to their indestructible qualities and Indelible Ink. They are extremely neat and ornamental; the writing can easily be removed with a little sand paper; they pack in a very small compass; and, unlike the clumsy wood labels, they are not liable to disturb the roots, or rot away in a few months.

*Wherever offered, hitherto, they have been almost invariably adopted.—INK, 6d., 1s., and 2s. per Bottle.*

The Labels and Ink to be had of all Nurserymen, Seedsmen, and Ironmongers in Town and Country; also, Wholesale of the Manufacturer,

**S. ROOKE, Jun., 7, Whittall Street, Birmingham.**

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG AND COMPANY (LATE W. AND C. YOUNG),

MANUFACTURERS OF IRON AND WIRE WORK, &c.,
22, PARLIAMENT-STREET, WESTMINSTER, LONDON;
48, NORTH-BRIDGE, EDINBURGH;
82, ST. ENOCH-SQUARE, GLASGOW;
1, CASTLE-BUILDINGS, DERBY-SQUARE, LIVERPOOL;

beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

PRICES.—18 ins. high, 9*d.*; 24 ins., 1*s.*; 30*s.* ins., 1*s.* 3*d.*; and 36 ins., 1*s.* 6*d.* per lineal yard.

| | | | | |
|---|---|---|---|---|
| Or a web of 100 yards, 18 ins. wide, will cost | ... | £3 | 15 | 0 |
| Do. of 100 yards, 24 ins. wide | ... | 5 | 0 | 0 |
| Do. of 100 yards, 30 ins. wide | ... | 6 | 5 | 0 |
| Do. of 100 yards, 36 ins. wide | ... | 7 | 10 | 0 |

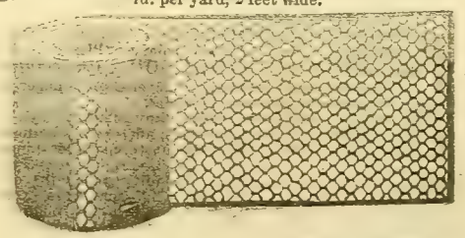
If more or less than a web is required, it would be charged at the same rate per yard.

This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has in many instances been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. YOUNG and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1*s.* is equal to 2¼ yards of another article in the market, the same width, at 9*d.* per yard. Samples for inspection sent free of expense.

C. D. YOUNG and Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland.



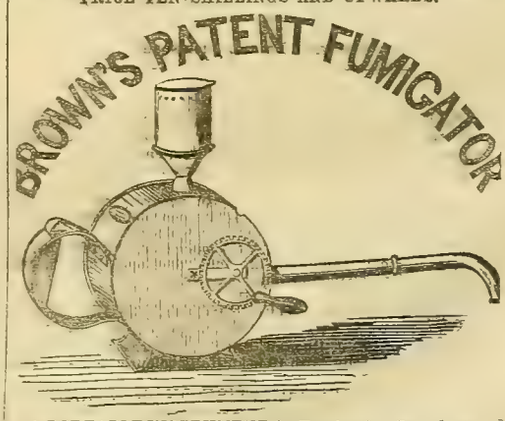
THE BIRMINGHAM CATTLE SHOW, 1851.

THE PRIZE LISTS FOR CATTLE, SHEEP, PIGS, AND POULTRY, are now ready; and Copies may be obtained from the Honorary Secretary.

T. B. WRIGHT, Hon. Sec.

Union-street, Birmingham, May 3.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.



| | Galvanised. | Japanned Iron. |
|---|---|---|
| 2-inch mesh, light, 24-inch wide ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch ,, strong ,, ... | 9 ,, | 6½ ,, |
| 2-inch ,, extra strong ,, ... | 12 ,, | 9 ,, |
| 1½-inch ,, light ,, ... | 8 ,, | 6 ,, |
| 1½-inch ,, strong ,, ... | 10 ,, | 8 ,, |
| 1½-inch ,, extra strong ,, ... | 14 ,, | 11 ,, |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

PRICE TEN SHILLINGS AND UPWARDS.

A PORTABLE INSTRUMENT for Fumigating Greenhouses, Stoves, and Frames, or Shrubs and Flowers, in the open air, more effectually in conjunction with SANGSTERS'S FLORUMBRA, without injuring the most delicate plant; delivering the smoke cool, in a dense mass, and effecting a great saving of Tobacco.

Manufactured and supplied to the Trade by Messrs. BARBER and GROOM, London; and may be had of all Ironmongers, Seedsmen, and Florists.

NEW MONTHLY PERIODICAL
BY THE

Part III. will be published very shortly, and will contain LONDON. By J. R. M'CULLOCH, Esq.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

---

NEW WORK BY EPHEMERA AND ANDREW YOUNG.
Just published, in fcap 8vo, with coloured Plates, price 14s.,
THE BOOK OF THE SALMON. By EPHEMERA; assisted by ANDREW YOUNG, of Inversbin, Manager of the Duke of Sutherland's Salmon Fisheries.

"The book is written in an easy conversational style; and the directions for procuring materials, and dyeing feathers for the construction of flies—by far the most important things for a salmon fisher—are succinct and intelligible to every one. Ephemera is certainly not wrong when he says the list of flies described is the best yet published. The book is an excellent continuation of the 'Handbook of Angling,' and ought to be bound up with it, and carried about in the portmanteau of every lover of the angle."—*Observer.*

London: LONGMAN, BROWN, GREEN, and LONGMANS;
Of whom may be had, in fcap 8vo, with Woodcuts, price 9s.,
EPHEMERA'S HANDBOOK OF ANGLING; teaching Fly-fishing, Trolling, Bottom-fishing, Salmon-fishing; with the Natural History of River Fish, and the best modes of Catching them. New Edition, enlarged.

---

Just published, in One very thick Volume, 12mo, with 12 Plates, price 14s. cloth; or with the Plates coloured, 21s. cloth.
THE BRITISH FLORA; comprising the Phænogamous or Flowering Plants and the Ferns. A number of Second-hand Rick Cloths in good condition with poles, &c., complete.

---

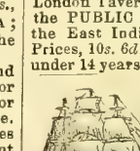
INTERESTING FACT.—"The following singular and authentic case of restoration of the human hair is worthy of observation, more particularly as it relates to an article of high and universal repute during the last half century. Mr. A. Herrmann, of Queen-street, Soho, had been quite bald for some time past, and had tried various preparations for the recovery of his hair, but without any beneficial result. He was then induced to try the effects of 'ROWLANDS' MACASSAR OIL,' and after daily applying it for about two months, he, much to his gratification, had his hair quite restored, and now possesses a beautiful head of hair. This fact speaks too strongly for itself to require comment."—*Bell's Weekly Messenger.*

ROWLAND'S MACASSAR OIL.
The unprecedented success of this discovery in restoring, preserving, and beautifying the Human Hair, is too well known and appreciated to need comment. For Children it is especially recommended as forming the basis of a Beautiful Head of Hair, and rendering the use of the fine comb unnecessary.



Price 3s. 6d.—7s.—Family Bottles (equal to 4 small), 10s. 6d., and double that size, 21s. per bottle. N.B. Each bottle of the genuine article has the words ROWLANDS' MACASSAR OIL engraved in two lines on the Wrapper; and on the back of the Wrapper nearly 1500 times, containing 29,028 letters.

Sold by A. ROWLAND and SONS, 20, Hatton-garden, London; and by Chemists and Perfumers.

---

Directions for use sent with each box, including bottle of Metallic Ink.

Sole Agents in London, G. and J. DEANE, Horticultural Implement Warehouse, 46, King William-street, London Bridge.

---

EPPS'S IMPROVED REGISTERED SULPHURATOR, for destroying the Mildew and Mould in Grapes, Hops, Roses, Heaths, Pansies, Fruit Trees, and Agricultural and Horticultural produce.

The Inventor submits this Machine with great confidence, as being the most useful and perfect of its kind invented. The construction is simple, strong, and effective, and can be used by the most inexperienced hand. It has been described in the *Gardeners' Chronicle*, and highly commended by Dr. Lindley, Dr. Plomley (in his lectures on the Mould in Hops), the editor of the "Gardeners' Magazine of Botany," and many eminent Gardeners and Agriculturists.

Manufactured and sold wholesale by BARBER and GROOM, Holborn, and to be had of all Seedsmen, Florists, Ironmongers, and the Inventor. Price 20s. and upwards.

Maidstone, May 3.

---

10, Craig's-court, Charing Cross, May 3, 1851.

---

TOOTHACHE PREVENTED by using BRANDE'S ENAMEL for filling decaying Teeth, and rendering them sound and painless. Price 1s. Enough for several Teeth. The only substance approved by the medical faculty, as being unattended with pain or danger, and the good effects of which are permanent.

Sold by all Chemists in the United Kingdom. Twenty really authorised Testimonials accompany each box, with full directions for use. Sent free by return of post by J. WILLIS, 59 Fleet-street, London, in return for thirteen penny stamps.

CAUTION.—The great success of this preparation has induced numerous unskilful persons to produce spurious imitations, and to copy BRANDE'S ENAMEL advertisements. It is needful, therefore, to guard against such impositions, by seeing that the name of JOHN WILLIS accompanies each packet.

---

HOLLOWAY'S PILLS FOR THE CURE OF WEAK STOMACHS AND BAD DIGESTION.—These Pills are the finest stomachic, and the most invigorating medicine ever known for weak stomachs. Persons of the most delicate constitutions may use them with perfect safety. A few doses soon improve the digestion and promote a good appetite, by which means sufferers are restored to a state of vigorous health which they had never dared to anticipate. HOLLOWAY'S PILLS are equally efficacious for bile, sick headaches, liver complaints, and affections of the lungs, and may be resorted to at any season without fear of danger arising from catching cold whilst taking them. Sold by all Druggists, and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

---

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn-place, in the parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church row, Stoke Newington, both in the County of Middlesex, Printers, at their Office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, MAY 3, 1851.

Dinner on Table at Half-past Five o'clock precisely.
Tickets, 21*s.* each, to be had of the Stewards, at the Tavern, and of the Secretary, 97, Farringdon-street.
EDWARD R. CUTLER, Secretary.

GARDENERS' BENEVOLENT INSTITUTION.—Notice is hereby given that the Half-yearly General Meeting of the Members of this Society will take place at the London Coffee House, Ludgate-hill, on Wednesday, the 11th of June next, for the purpose of Electing Two Pensioners on the Funds of the Institution. The Chair will be taken at 12 o'clock precisely, when the Ballot will commence, and close at 2 o'clock precisely.
By order, EDWARD R. CUTLER, Secretary.
May 8, 1851. 97, Farringdon-street.

POSTPONEMENT OF EXHIBITION.—The Committee for managing the Grand Annual TULIP EXHIBITION, give Notice, that the Day of Show is postponed to TUESDAY, MAY 27th.
Derby, May 6. By order, E. S. DODWELL, Hon. Sec.

FOR SALE, a choice collection of STOVE AND GREENHOUSE PLANTS, &c.—Enquire of the Gardener, Rectory, Acton, Middlesex.

CHEAP BEDDING PLANTS.

JOHN HAYES, FLORIST, Farnham, Surrey, begs to state that he is prepared to send out BEDDING PLANTS from 1*s.* 6*d.* to 3*s.* per doz.
Descriptive Catalogues sent on the receipt of one postage stamp. Prizefighter and Farnham Castle Cucumber, 1*s.* per packet.

BATH NURSERY.

JAMES GRIFFIN begs to announce that his Annual Spring CATALOGUE is now ready, and may be had on application. It contains a Descriptive List of all the newest and best Dahlias, Fuchsias, Verbenas, Phloxes, &c.; also a Select List of the most useful plants adapted for decorating the Flower Garden. The prices will be found exceedingly low.
Weston-road, Bath.

"BERBERIS DARWINII."
(Beautiful Hardy Evergreen Shrub from the Snow Line on the Andes of Patagonia.)

MESSRS. VEITCH AND SON feel the greatest confidence in offering for sale the above valuable BERBERIS, a plant and also a cut specimen of which were exhibited at the Horticultural Society's Rooms in Regent-street, the 1st of April last, and received the "*Large Silver Medal.*" They beg to refer to Dr. Lindley's report in the *Gardeners' Chronicle* of April 5th, as follows:

"This proves to be a species whose importance it is almost impossible to overrate, inasmuch as it is exceedingly handsome, perfectly hardy, and naturally produces its rich orange blossoms in great profusion during the early months of the year. Indeed, for general value, we have nothing at present at all to be compared with this fine Berberry."

Strong plants will be ready for sending out on and after the 12th of June next, at 21*s.* each, with the usual allowance to the trade.—Exeter, May 10.

"MEDINILLA MAGNIFICA."

MESSRS. VEITCH AND SON have much pleasure in offering this splendid and unique Stove Plant, with pendulous bunches of flowers 12 to 18 inches in length, having beautiful large rose-coloured bracteas.

It was exhibited at the Horticultural Society's Room, Regent-street, on the 2d of April, 1850, and was awarded the *Large Silver Medal.* For description, see *Gardeners' Chronicle*, April 6th, 1850.

It was again exhibited at Chiswick, on Saturday last, May 3d, where it received the "*Certificate of Excellence.*"

It is figured in Curtis's "Botanical Magazine" for September, 1850.

It has been so much admired by all who have seen it, and is altogether so first-rate a plant, that Messrs. VEITCH AND SON can recommend it with the most perfect confidence.

Strong plants will be ready for delivery on and after the 12th of June next, at 63*s.* each, with the usual allowance to the trade; and, when six plants are taken, an additional one will be put over.—Exeter, May 10.

CANTUA DEPENDENS, OR BUXIFOLIA.
A BEAUTIFUL NEW HARDY GREENHOUSE PLANT FROM PERU.

MESSRS. VEITCH AND SON have the greatest satisfaction in offering to the Public the above lovely plant, from the Andes of Peru, where the flowers are so much esteemed by the natives that they adorn their chambers with them on feast days.

It was exhibited in Regent-street on the 15th of April last, and received the LARGE SILVER MEDAL (see *Gardeners' Chronicle* of April 19th.)

It was again exhibited at Chiswick on the 3d of this month, and was then awarded the highest prize given for new plants—THE SILVER GILT MEDAL.

It is a plant of neat habit and foliage, blooms freely in a small state, and may be kept in a cold pit or frame through winter, being of about the same hardiness as the Fuchsia, and as easy of cultivation; from its novelty and beauty, it will be an acquisition to every collection, and be cultivated by every florist. It is figured in Curtis's "Botanical Magazine" for this month, and will also shortly appear in Paxton's "Flower Garden." Good established plants will be sent out on and after the 12th of June, at 21*s.* each, with the usual discount to the Trade.

CHOICE BEDDING PLANTS.

HENRY WALTON, FLORIST, &c., Edge-end, Marsden, near Burnley, Lancashire, begs to offer the following at the extremely low prices attached, viz., 100 fine named Dahlias, including several of 1850, for 50*s.*; 50 for 30*s.*; 25 for 19*s.* to 18*s.*; 12 for 4*s.* 6*d.* to 9*s.*; Pansies, 25 fine named varieties, 10*s.*; 12 do., 4*s.* 6*d.* to 6*s.*; 12 fine named Pinks, 4*s.*; 12 Verbenas, 3*s.* 6*d.*; 12 fine named scarlet Geraniums, 4*s.* 6*d.* to 6*s.*; 12 Ivy-leaved do., 4*s.*; 12 common Geraniums, fine strong plants, 4*s.* 6*d.* to 6*s.*; 12 Cupheas, 3*s.* 6*d.*; 12 Heliotropiums, of sorts, 4*s.*; 12 fine named Petunias, 4*s.*; 12 Mimulus, 4*s.*; 12 Lobelia erinus, of sorts, 6*s.*; or 12 of each of the above lots for 2*l.* The above may be had the second week in May, in strong healthy plants, securely packed, so as to ensure safe delivery of all orders.

Achimenes Tugwelliana, longiflora alba, fimbriata, Ghiesbreghtii, Bodmeri, Escherii, rosea superb, eximia rosea, cordata, Knightii, Skinneri grandiflora, patens major. The above 12, free by post, for 10*s.*; or 6 for 7*s.* 6*d.* Gloxinias, 12 fine named varieties for 9*s.* to 16*s.*; or 6 for 5*s.* to 10*s.*

Catalogues may be had by inclosing one stamp. Strong well-rooted plants may be depended upon. It is respectfully requested all orders be accompanied with a Post-office order, made payable at Marsden, near Burnley, Lancashire.

WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

5 To Mr. Green, for a collection of Helichrysums
6 To Mr. Cole, for 10 varieties of Cape Heaths, in 11-inch pots
7 To Mr. Taylor, Gardener to J. Coster, Esq., for a collection of Cape Heaths, in 8-inch pots
8 To Mr. Ambrose, of Battersea, for a collection of Fancy Pelargoniums
9 To Mr. Loddiges, F.H.S., for Aerides sp.
10 To Messrs. Veitch and Son, for a single specimen of Erica elegans
11 To Mr. Bray, Gardener to E. Lousada, Esq., of Peak-house, Sidmouth, for a Queen Pine Apple, weighing 3 lbs. 3 oz.
12 To Mr. Davis, Gardener to Lady Bridport, of Cricket St. Thomas, Crewkerne, for two Black Prince Pine Apples in a pot
13 To Mr. Davis, Gardener to Lord Boston, at Hedsor, Bucks, for a Providence Pine Apple, weighing 8 lbs. 4 oz.
14 To Mr. Fleming, Gardener to the Duke of Sutherland, F.H.S., at Trentham, for Black Hamburgh Grapes
15 To Mr. Davis, of Oak-hill, East Barnet, for the same
16 To Mr. Jackson, Gardener to H. Beaufoy, Esq., of South Lambeth, for Dutch Sweetwater Grapes
17 To Mr. Davis, of Oak-hill, East Barnet, for the same
18 To Mr. Bain, Gardener to B. Bernasconi, Esq., of Harrow-Weald, for White Frontignan Grapes

### THE SILVER KNIGHTIAN MEDAL.

1 To Mr. Dods, Gardener to Sir J. Cathcart, Bart., F.H.S., for a collection of 10 Stove and Greenhouse Plants
2 To Mr. Stanly, Gardener to H. Berens, Esq., F.H.S., for a collection of six Stove and Greenhouse Plants
3 To Mr. Ivison, for a collection of six species of Exotic Orchids
4 To Mr. Roser, Gardener to J. Bradbury, Esq., for a collection of 10 varieties of Cape Heaths in 11-inch pots
5 To Messrs. Rollisson, for the same, in 8-inch pots
6 To Mr. Robinson, Gardener to J. Simpson, Esq., of Thames Bank, Pimlico, for a collection of Cinerarias in 6-inch pots
7 To Mr. Bragg, of Slough, for a collection of Pansies in pots
8 To Messrs. Henderson, of Pine-apple-place, for Broughtonia violacea
9 To Mr. Cole, for Allamanda neriifolia
10 To T. B. Graham, Esq., of Lavender Sweep, Clapham Common, for a single specimen of Erica Sindryana
11 To Messrs. Veitch and Son, for Nepenthes Rafflesiana
12 To Mr. Barnes, Gardener to Lady Rolle, of Bicton, for a Queen Pine Apple
13 To the same, for a Prickly Cayenne Pine Apple, weighing 4 lbs. 10 oz.
14 To Mr. Jackson, Gardener to H. Beaufoy, Esq., of South Lambeth, for a Providence Pine Apple, weighing 7 lbs. 9 oz.
15 To Mr. Parsons, Gardener to A. George, Esq., of Ponder's End, for Black Hamburgh Grapes
16 To Mr. Davis, of Starch Green, Hammersmith, for the same
17 To Mr. Grant, Gardener to G. H. Simms, Esq., of Borthwick Hill, Bath, for a White Fleshed Melon, named "Victory of Bath"

### THE SILVER BANKSIAN MEDAL.

1 To Mr. Over, Gardener to W. M'Mullen, Esq., for a collection of ten Stove and Greenhouse Plants
2 To Mr. Watson, Gardener to Mrs. Tredwell, of St. John's Lodge, Lower Norwood, for the same
3 To Mr. Fancourt, Foreman to Mr. Cant, of St. John's-street Nursery, Colchester, for a collection of Cinerarias in 6-inch pots
4 To Mr. Carson, for Trichopilia coccinea.
5 To Mr. May, Gardener to Mrs. Lawrence, F.H.S., for Pimelea Nieppergiana
6 To Mr. Ivison, for a single specimen of Indigofera decora
7 To Mr. Green, for Ixora Griffithii
8 To Messrs. Veitch and Son, for Nepenthes sanguinea
9 To Mr. Hamp, for a collection of Amaryllids
10 To Mr. Fleming, for a Black Antigua Pine Apple, weighing 3 lbs. 4 oz.
11 To Mr. Bray, for a Providence Pine Apple, weighing 5 lbs. 1 oz.
12 To Mr. Bain, Gardener to B. Bernasconi, Esq., for Black Hamburgh Grapes
13 To Mr. Snow, Gardener to Earl de Grey, Wrest Park, Silcoe, for a collection of Apples and Pears
14 To Mr. Ingram, Gardener to Her Majesty at Frogmore, for May Duke Cherries
15 To Mr. Turnbull, Gardener to the Duke of Marlborough, at Blenheim, for Keens' Seedling Strawberries
16 To Mr. Smith, of Mogden-lane, Isleworth, for the same
17 To Mr. Robertson, Gardener to Lady Foley, of Stoke Edith Park, Ledbury, for a Persian Hybrid Melon

### THE CERTIFICATE OF MERIT.

1 To Mr. Loddiges, F.H.S., for Lycaste sp.
2 To Mr. Franklin, Gardener to Mrs. Lawrence, F.H.S., for Epidendrum sp.
3 To Mr. Turner, of Holloway, for a collection of Alpines in pots
4 To Mr. Wilmer, of Sunbury, for a collection of 24 Auriculas
5 To Mr. Woolley, Gardener to H. B. Ker, Esq., of Cheshunt, for a collection of Lycopods
6 To G. W. Hoyle, Esq., of Reading, for Epiphyllum speciosum Brookii
7 To Mr. Stanly, for a collection of Apples and Pears
8 To Mr. Fleming, for May Duke Cherries
9 To Mr. Elliott, Gardener to Mrs. Boothby, of Twyford Abbey, near Acton, for Keens' Seedling Strawberries.

N.B.—Messrs. Lane, of Great Berkhamstead, would have obtained a Certificate of Merit for a collection of Cinerarias, if they had complied with the regulations in regard to the size of pot in which they should have been shown.

THE FLOWER OF THE DAY—VARIEGATED SCARLET GERANIUM.—This elegant plant is of vigorous habit, the foliage bright green, with a broad silver margin. The flowers light scarlet, in large trusses, like Globe Compactum. JOHN and CHARLES LEE are selling extra strong plants, at 10s. 6d. each. Small plants for bedding on the 1st of June, 60s. per dozen.—Nursery and Seed Establishment, Hammersmith, near London.

FIFTY-FOLD KIDNEY POTATO.

JAMES LAKE, NURSERYMAN, &c., Bridgewater, Somerset, begs to inform the public that he is now sending out his Seedling Fifty-fold Kidney Potato, six tubers of which were sent to Dr. Lindley, April 29th, 1850, and produced 312, quality very good; six tubers also sent to Beck, Henderson, and Co., at the same time, produced 580, although grown in poor ground. Price 4s. per peck.—London Agents: HURST and M'MULLEN, 6, Leadenhall-street.

J. L. having grown from 15 to 20 lights of Aban's Conqueror of the West CUCUMBER, successfully for three years, can with confidence recommend it to the public as being one of the best kinds in cultivation. Packets containing 12 seeds, 1s. each.

VALUABLE VEGETABLES.—CAULIFLOWERS.—Myatt's improved early, much earlier than the old varieties, more compact and heavier, considered by the raiser as most desirable, quantity very limited; 1s. packets.

BRUSSELS SPROUTS, improved variety, direct from Brussels; 1s. per oz., 6d. per packet.

CABBAGE, MITCHELL'S ENFIELD.—This has been tried at the Horticultural Society's Garden, and pronounced one of the best; 1s. per oz., 6d. per packet.

CABBAGE, CHAPPEL'S COLEWORT, excellent for Winter Greens, 6d. per oz.

CARROT, ST. JAMES', one of the best for small gardens, and shallow or heavy soils; 3d. per oz.

CELERY, COLES' SUPERB RED, very extensively grown last season, and pronounced first-rate; 1s. per oz., 6d. per packet.

LETTUCE, VICTORIA CABBAGE, but little known, but one of the handsomest grown, and which no gentleman's garden should be without.

DUNCAN HAIRS, in offering the above selection from his general List, begs to inform his friends that he warrants them to be as described.

109, St. Martin's-lane, Charing Cross, London.

ROSES.

EDWARD DENYER, NURSERYMAN, Loughborough-road, Brixton, near London, respectfully informs the admirers of Roses that his collection of Standard and Dwarf Roses is now in full bloom, in the Rose house. Calceolarias, fine spotted varieties; Geraniums, Fuchsias, Verbenas, &c. A Catalogue sent on application.

E. D. informs his kind patrons that he has no Seedshop in London.

CHEAP DAHLIAS.

HENRY LEGGE is now sending out all the leading Flowers of 1851, at 9s. to 12s. per dozen; the good old, from 3s. to 4s. per dozen.—Catalogues can be had by sending one postage stamp to HENRY LEGGE, Marsh Side, Lower Edmonton, Middlesex.

HUGH LOW AND CO.'s NEW CATALOGUE OF PLANTS is just published, and will be sent free on prepaid application.—Clapton Nursery, London.

CALCEOLARIA "SULTAN."—This very desirable and shrubby CALCEOLARIA for bedding is now on sale, at 5s. each, or two guineas per dozen; habit dwarf, with large dark flowers; it is very hardy, and peculiarly adapted for the flower garden, throwing up a constant succession of its rich ruby-coloured trusses of bloom throughout the season.

Though of a different colour, it is equal for bedding purposes to the well known Calceolaria Kentish Hero, sent out five years since.

JOHN ANDREW HENDERSON and Co., Pine-apple-place, Edgware-road, London.

VERBENAS, SCARLET GERANIUMS, PETUNIAS, DAHLIAS, FUCHSIAS, CHRYSANTHEMUMS, and all the popular varieties of Bedding Plants.

*Many thousands of the most showy and favourite Bedding Plants are now ready for sending out, strong and cheap. Persons preparing to plant are recommended to peruse our Priced Descriptive Spring Catalogue, stamped as a Newspaper, to go free by post, and supplied gratis.*

For HARDY PLANTS, consisting of Antirrhinums, Phlox, Pentstemons, Lobelias, Potentillas, Rock, and other Herbaceous Plants, select Flowering Shrubs, Roses, Climbing Plants, &c. &c., see our Autumn Catalogue, supplied gratis.

BASS and BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

STRAWBERRY BEDS.—To those Ladies and Gentlemen who have changed their residence since the 25th of March, or not having an opportunity of forming beds to bear this season, EDWARD TILEY begs to inform them they may yet do so, he having a large stock of Strawberries grown in pots for the purpose of late planting; they are well set with bloom, such as will insure fruit this year, and double the quantity over those planted in the autumn for the next season. They consist of the following first-rate varieties: Kitley's Goliah, Elton Pine, Alice Maud, Cole's Prolific, and British Queens. Any of which can be forwarded at 4s. 6d. per dozen, hamper and package included. A remittance must accompany the order, either in cash or penny postage stamps.—EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath.

AZALEA INDICA "SYMMETRY" (KINGHORN.)—The celebrity this Flower has gained, and the eulogium that has been bestowed upon it, render it only necessary to mention the opinions of competent judges, the awards it has received, and simply to add that it is superior in shape and substance to any variety hitherto introduced, and equal in colour and habit to the most popular kinds. In May, 1850, a first class certificate was awarded to it by the London Floricultural Society, and it was thus described in the *Gardeners' and Farmers' Journal*. "Azalea indica Symmetry is a magnificently formed flower, of extraordinary substance; colour salmonish-pink, varying to light scarlet, richly spotted in the throat with deep crimson; size large." At the June show, 1850, at Chiswick, it obtained the Silver Banksian Medal, and was recorded in the *Gardeners' Chronicle* as "a considerable improvement on Lateritia." JOHN and CHARLES LEE having purchased the stock of Symmetry, intend sending out healthy Plants on the 1st of June, price 21s. each.—Nursery and Seed Establishment, Hammersmith, near London.—May 10.

NEW DAHLIAS; E. FOSTER'S, Esq., CHOICE PELARGONIUMS; PICOTEES, CARNATIONS, HOLLYHOCKS, PANSIES, &c.

WILLIAM BRAGG, Star Nursery, Slough, begs to say his Catalogue of the above Flowers is now ready, and can be had on application. His choice SEEDLING DAHLIAS will be sent out the first week in May at 10s. 6d. each, viz.:—

ADMIRAL, rich lilac, very constant, gained first Seedling prize, 25s., at the Royal South London Exhibition; 21s. Shacklewell Open Shows, &c., fourteen first class certificates; the most successful flower of the year.

CARMINA, rich carmine, constant show flower, gained six first class certificates, &c., shown in several winning stands.

The Hon. Mrs. ASHLEY, waxy white, tipped with rose, splendid show flower, &c. W. B. thinks it the best Dahlia of the season; was awarded by Dr. LINDLEY a certificate of merit at the Horticultural Society, &c. Gained five first class certificates.

QUEEN OF FAIRIES, Domeyer. W. BRAGG has purchased the stock of this fine and constant fancy Dahlia, from the above amateur, who will give 5l. in prizes the next season for this flower. It gained a Seedling prize and first class certificate, with Edwards's Mrs. HANSARD; at the Royal South London Open Show Exhibition five first class certificates.

W. B.'s stock of Picotees, Carnations, and Pinks are strong and good; the best Hollyhock Seed ever sent out can be had in 2s. 6d. and 5s. packets, post paid, for prepayment.

E. G. HENDERSON is now prepared to send out the following New Plants:—

| | | | | s. | d. |
|---|---|---|---|---|---|
| FANCY GERANIUM, Delicatum (Ambrose's) | | | ... each | 21 | 0 |
| SCARLET GERANIUM, Beauty of the Parterre | | | ... ,, | 10 | 6 |
| Ditto | Ditto | Peach Blossom | ... ,, | 10 | 6 |
| Ditto | Ditto | Bridal Bouquet | ... ,, | 10 | 6 |
| Ditto | Ditto | Golden Admiration | ... ,, | 15 | 0 |
| POTENTILLA ANTWERPENSIS | | | ... ,, | 7 | 6 |

| Ditto | Conspicuum | Do. | ... ,, | 7 | 6 |

For descriptions of the above, see Spring Catalogues for 1851, which will be ready for delivery early in May, and will be sent post free on application.

E. G. H. also calls attention to the following new Strawberries:

| | s. | d. |
|---|---|---|
| PREMISSES DE BAGNOLET, very late, good plants in pots ... ... ... ... ... ... ... each | 1 | 0 |
| CREMONT'S PERPETUAL, a double bearing variety of superior quality, good plants in pots ... ... each | 2 | 6 |

Wellington Road Nursery, St. John's Wood, May 10.

DAHLIAS.—The largest Stock in the Kingdom, of the finest kinds, both Fancies and other varieties. CHARLES TURNER can supply the above at 12*s.*, 18*s.*, and 30*s.* per dozen, fine constant kinds, and good plants, the selection left to C. TURNER. A list of those not desired should be forwarded with the order. Parcels paid to London, and plants given over to compensate for any additional expense.

A TREATISE ON THE CULTURE OF THE DAHLIA will be presented with each order.

Royal Nursery, Slough.

NEW SCARLET PELARGONIUMS, &c.

CONWAY'S "King of Nepaul," a bright scarlet, with large globe truss, horse-shoe leaf, habit of Tom Thumb, good for either bedding or pot, 7*s.* 6*d.* each.

CONWAY'S "Pet Superb," a bright pink, distinct variety, very dwarf, and pretty for bedding or pot, 5*s.* each.

| | | | |
|---|---|---|---|
| Flower of the Day | 5*s.* 0*d.* | Commander-in-Chief | 2*s.* 6*d.* |
| Princess Alice (Conway's) | 2 6 | Cerise Unique | 2 6 |

Or the set of six for 1*l.* 1*s.*, basket included.

The following have been selected as choice varieties, viz.:—

| | |
|---|---|
| Excellence | Ibrahim Pacha |
| Gem of Scarlets | Mrs. Mayler |
| Cottage Maid | Tom Thumb's Master |
| Trentham Scarlet | Reed's Scarlet |
| Queen of Summer | Queen Improved |
| Princess Royal | Royalist |
| Tam O'Shanter | Punch |

At 1*s.* each, the set of 14 for 12*s.*, or with the six first named varieties for 30*s.*, basket included.

The following Pink varieties are also offered at 1*s.* each, or the set for 8*s.*, basket included:—

| | |
|---|---|
| Jenny Lind | Pink Nosegay |
| Judy | Cherry Cheek |
| Lucia Rosea | Captain Darling |
| Princess Alice (Ingram's) | Pet |
| Rosy Morn | |

Prize Fighter improved, Tom Thumb improved, or Symmetry, are recommended as very excellent sorts for bedding, at 6*s.* per doz.

NEW PETUNIAS.

CONWAY'S "Lady Rokeby," white, with purple throat, a highly desirable variety, 5*s.* each; "Captivation," 1*s.* 6*d.* each. "Beauty Supreme" is confidently recommended as one of the best Petunias for bedding, at 6*s.* per doz.

NEW CALCEOLARIAS.

CONWAY'S "Floribunda," a dwarf, free, and constant bloomer, bright yellow, large trusses, recommended for bedding or pot culture, 3*s.* 6*d.* each; "Multiflora," 1*s.* 6*d.* each, and numerous other sorts at 6*s.* to 9*s.* per doz.

VERBENAS.

A large collection of Verbenas at 6*s.* to 9*s.* per doz.

CONWAY'S "Coronata" Geranium, pink, with white centre, an early, profuse, and constant bloomer, 2*s.* 6*d.* each.

N.B.—A large assortment of Fancy and other Geraniums, Fuchsias, Heliotropes, Antirrhinums, Chrysanthemums, Dahlias, &c.

MARY CONWAY, Earl's Court Nursery, Old Brompton, near London.—A Catalogue may be had on application.

NEW DAHLIAS.

CHARLES TURNER is now sending out strong plants of the following beautiful kinds:—

| | |
|---|---|
| Barmaid | Nil Desperandum |
| California | Regina |
| Duke of Rothesay | Roundhead |
| Gem of the Grove | Sulphurea pallida |
| Grandis | Sir C. Napier |
| Jullien | FANCIES. |
| Lady E. Cathcart | Kingfisher |
| Leda | Miss Weyland |
| Model | Mrs. Hansard |
| Mr. Palmer | Mrs. Willis |
| Napoleon | Nonsuch |
| Nepaulese Prince | Pretty Polly |

C. TURNER can supply plants of other raisers' new varieties.

Royal Nursery, Slough.

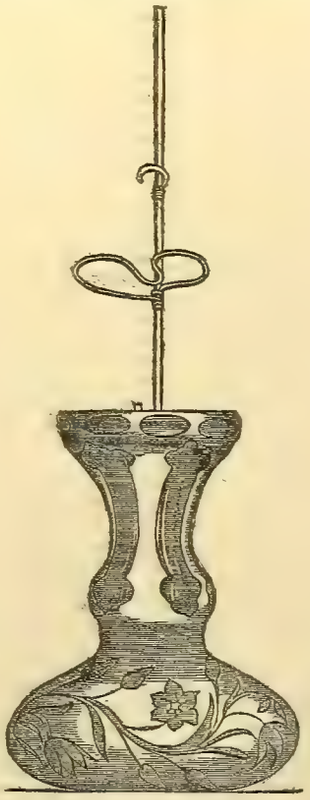
COUNTRY SHOWS.—Wednesday, May 14: Forfar Horticultural.—Thursday, May 15: Stamford Hill Horticultural, Highbury and North London Horticultural, and Ipswich Horticultural.—Friday, May 16: Cornwall Horticultural.



THE Horticultural season has opened magnificently, and it is already abundantly evident that the tide of skilful gardening is still rising with accumulated force. Accustomed as we are to the May glories of the CHISWICK SHOWS, we have never witnessed anything like what the exhibitors produced on Saturday. Azaleas, Orchids, stove and greenhouse plants, Roses, were all displayed in such profusion, that nobody missed the Pelargoniums, of which the growers did not venture to present one; so fickle is fashion, and so steadily is the race of fancy Geraniums—admirably represented by Mr. AYRES and Mr. AMBROSE—supplanting the others in public favour. In what profusion fine plants were supplied, may be judged of from the fact that a new tent, containing 400 feet of additional tables, was pitched, and nevertheless the whole space was filled.

A large part of our columns of to-day is occupied with a detailed account of this first Horticultural Show, which the foreigners present justly regarded as an exhibition as unapproachable in any other country than England as that within the Palace of Glass itself. To the extended remarks of our reporter we have but a word or two to add.

Of novelties there was not much, but some of the plants were of high interest. First came Messrs. VEITCH'S Cantua dependens, the most glorious species that yet has reached us from the west; a shrub, as hardy as a Fuchsia, and far more gay, because of the rich mixture of yellow and purple and violet in its long tubular flowers. Then appeared, among the Orchids, Colonel FEILDING'S famous Fox's Brush, a most charming new species of Aerides, with long gay festoons of rosy blossoms. Hardly inferior in interest was the true Deutzia gracilis, from M. BAUMANN, of Ghent: a brilliant graceful hardy bush, from Japan, with snow-white flowers like those of the Syringa. We also noticed a new Billbergia, from M. DE JONGHE, of Brussels, not well enough grown to show whether it will become, as it promises, a valuable stove plant; a new Lycaste, with pale yellow flowers, from Messrs. LODDIGES; and an Arpophyl, in the collection of Orchids, from Mr. WARNER'S gardener.

Had this meeting taken place on the 1st or 2d of May it would have been a charming scene beyond the tents, for the tender foliage of the trees was far enough advanced to produce the usual effect of vernal beauty, and the entrances to the garden were as gay with flowers as in July. But by noon time, a soft May morning, succeeded by a smart shower, had settled into a day of gloom and rain, accompanied by a cold wind from the north-east; and the enjoyment of the day was gone. A large part of the visitors stopped at the Crystal Palace on the way down; and not more than 1549 persons assembled to witness one of the most beautiful horticultural scenes which even the Chiswick Gardens have presented. These were, however, real enthusiasts, and neither rain nor cold could prevent their lingering over the banks of Roses and Azaleas, or wandering away to the remote parts of the Garden where Mr. HOSEA WATERER'S unrivalled Rhododendrons are to be exhibited at the next meeting, on the 7th of June.

SOME weeks since Mr. FLEMING, of Trentham, sent to the Horticultural Society a specimen of a Hyacinth Glass, contrived by Mr. TYE, of Birmingham, which deserves a better notice than the slight allusion made to it at page 119. In form it is something like an old-fashioned Dutch bottle; but the neck is widened sufficiently to receive the bulb of a Hyacinth at the mouth, and is again swollen near the base, but less than before, so as to destroy the ugly effect of a long narrow column. The peculiar form of the lower part causes the weight to be almost wholly thrown upon the base, by which means the glass is made to stand so firmly that no ordinary accident will upset it. When used for bulbs a stout upright rod is readily attached to the neck by means of a circular

spring acting within and below the rim; and this upright is furnished with loops which steady the flower stems and render it impossible for them to fall out of the perpendicular. When the season for bulbs is over, the rod and its loops are readily removed, and the glass becomes either an ornamental object, or a jar in which cut flowers may be placed. This is by far the most beautiful contrivance of the kind we have yet seen, and will no doubt universally displace the ugly things now in use.

TYE'S Hyacinth glasses are manufactured of various colours and materials, so as to accommodate purchasers. One now before us has a charming topaz yellow transparent pattern, cut upon an opaque white ground, and is probably that which best harmonises with the objects it is intended to support.

FEW things in the CRYSTAL PALACE are, to our minds, more interesting than the specimens of Colonial produce. They tell us of the condition of distant friends, and of the prospects of those from whom we are about to separate; they speak unmistakeably of the relative value of regions concerning which few can have any personal knowledge, and of the future destiny of countries which may one day become our rivals. They point, out, moreover, where our merchants, our manufacturers, our artisans are to look for those raw materials, in the absence of which their intelligence and skill would remain without application. Looking in this way at Canada, and the other British North American Colonies, we perceive signs of a prosperity which nothing but fatuity can destroy; and comparing them with the United States, we see no cause of regret at having lost the one while we retain the other. The corn of Canada is inferior indeed to that of Adelaide, and its minerals may suffer by comparison with those of the Burra Burra, as its timber does with the beautiful cabinet woods of British Guiana, the Bahamas, and Van Diemen's Land; nevertheless, its nearness to our own shores counterbalances such disadvantages, and its richness in all that constitutes the real strength of a country is abundantly manifest.

Viewed in this manner, it is impossible not to see that Van Diemen's Land itself, much as it has suffered, and low as it seems to have sunk in public estimation, is, nevertheless, a mine of inexhaustible wealth. In its timber and fancy woods alone, it yields to no region that is represented in the Exhibition. The beauty of the Huon Pine, for example, excels that of Satin-wood or Bird's-eye Maple; the Black-wood equals Rosewood; what is called Dog-wood, said to be a Bedfordia, is like the finest brown gnarled Oak; and the common Musk bush (*Eurybia argophylla*), which in Van Diemen's Land becomes a tree, produces veneers that are, we think, without a rival. There is a small work-table, No. 12, made of this material, which is not excelled by any similar piece of furniture in the building.

Of these woods, Mr. BACKHOUSE'S account will just now be read with interest:

"The timber from Macquarie Harbour is very fine. Huon Pine, supposed to be a species of *Dacrydium* (Franklinii), which is much valued for ship-building and general purposes, abounds on the eastern side. The wood is closer grained, and more durable than White American Pine, and has an aromatic smell. This tree attains to about 100 feet in height, and 25 in circumference, and is of a pyramidal form; the branches from the trunk are a little below horizontal, and are clothed with numerous slender, pendent, scaly branchlets of lively green, serving the purpose of leaves, as in the Cypress and Arbor-vitæ. Celery-topped Pine, *Thalamia* (Phyllocladus) *asplenifolia*, so called from the resemblance of a branch clothed with its dilated leaves to the leaf of Celery, is well calculated for masts. Myrtle, allied to Beech, but with leaves more like dwarf Birch, is suited for keels. Light wood, *Acacia melanoxylon*, clothed with leaf-like spurious foliage, resembling the leaves of a Willow, is also fine timber, and its roots make beautiful veneering. It derives this name from swimming in water, while the other woods of Van Diemen's Land, except the Pines, generally sink; in some parts of the colony, it is called Black-wood, on account of its dark colour. Other timber-trees are known here by the names of Pink-wood, *Carpodontos lucida*, Hard-wood, a species of *Olea*, Sassafras, *Atherosperma moschatum*, Stink-wood, *Zieria arborescens*, &c. Forest Tea-tree, a species of *Leptospermum*, is valued for fuel; some crooked portions of its trunk are finely veined, and well adapted for fancy work. The black substance forming part of the stems of Tree Ferns, is used for reeding, in inlaying, for which purpose it is superior to Ebony." —*Narrative*, p. 48.

A good many specimens have been sent of the Tasmannian Beech, or, as the colonists call it, Myrtle (the *Fagus Cunninghamii* of botanists), and this tree seems to be one of considerable merit, as well as enormous size. Mr. BACKHOUSE says (p.122), that, on the Hampshire hills, "near the Guide River, he measured two Myrtles, of 32 and 45 feet round; these and many others appeared to be about 150 feet high. Few Myrtles exceed 30 feet in circumference, and they often diminish suddenly at about 10 feet from the ground, losing nearly as much in circumference.

In thus mentioning the timber of Van Diemen's Land we must not omit noticing the Blue Gum Tree (*Eucalyptus globulus*), of which an ample account was given by us last week. It is represented by

Sir WILLIAM DENISON, in the letter which accompanied the specimens now on view, that its timber is equal to Oak for ship building. If so, the Tasmannian dock-yards must become some day of great importance, for the trees are extremely common, and are said to grow 6 feet in length annually while young. Two specimens now in the Exhibition building, are taken from the same trunk, 134 feet apart, and the highest is nearly 3 feet in diameter.

We cannot be mistaken in supposing that the making known the existence of sources of wealth like these, will form one of the great results of the Exhibition of Industry; another may be the introduction to our own shores of some at least of the living timber, which now grows only at the antipodes. How far that is practicable, is a question that we shall probably discuss next week.

## CULTURE OF FRANCISCEAS.

By M. DE JONGHE, OF BRUSSELS.

I HAVE just read an article in the *Gardeners' Chronicle* (p. 262), on the Francisea confertiflora, and, as perhaps the origin and history of this beautiful plant (which, with F. eximia will probably be for some time to come objects of considerable interest) is but imperfectly known to your readers; the following facts relating to it may prove acceptable to them.

The Franciscea confertiflora is a native of the province of St. Paul, in Brazil, and is found on the summit of Mount Cubaton, five leages from Sanctos, where it grows in a heavy soil, shaded and surrounded by virgin forests. It was discovered by my collector, M. Libon, and sent by him to Brussels, where it arrived in November 1847. A plant was sent in May, 1848, to Messrs. Low and Co., and from them it has found its way into the gardens of English amateurs.

I am obliged to your correspondent "W. K.," Knowsley Hall, Lancashire, for the valuable information furnished by him touching the cultivation of this plant. From the statements of M. Libon, and the specimens in my herbarium, it appears that the Franciscea confertiflora, forms in its natural state, a bush, scarcely 3 feet high, but covered with a profusion of violet-blue flowers. Mr. "W. K.," has succeeded in growing the plant in a foreign climate, and showing how it ought to be treated in European houses, and for so doing, he deserves the praise and thanks of all who care for the cultivation of new and beautiful plants. Having myself just finished some remarks on the cultivation of Franciscea eximia, I send them for insertion in the *Gardeners' Chronicle*, in the hope that they may prove interesting to the English gardening world.

*On the cultivation of Franciscea eximia.*—The great difficulty with which every one who attempts to cultivate a tropical plant in a European hothouse has to contend, is ignorance of the habits of the plant—of its period of growth—of its period of rest. In consequence of this ignorance, which can only be dispelled by careful observation, during two or three years after the plant's arrival; and, in consequence of the eagerness of people to attain perfection all at once, and of their tendency to condemn everything that falls short, though for a brief time, of their expectations, many a new plant has been neglected and set aside, which, had a little more time been spent in endeavouring to bring it to perfection, would have proved well worthy of continued favour and increased popularity. It is then, in my opinion, the duty of every one who introduces new plants, to make known everything concerning them which may enable the gardener to bring them as soon as possible into the highest degree of beauty, that they may not be prejudged, and thrown away as unworthy of notice. This, I shall now proceed to do for the Franciscea eximia, which is certainly one of the most beautiful of newly introduced plants, and of any hitherto brought from Brazil, and cultivated in European houses. The botanical description of this plant, which would be out of place in the columns of the *Gardeners' Chronicle*, is to be found in several of the journals more exclusively devoted to botany.

The Franciscea eximia was found by M. Libon in a virgin forest not far from Villa Franca, in the province of St. Paul, in Brazil. It grows naturally in shady places, in small open spaces in the forest, where it forms a bush two or three feet high; the flowers are numerous, richly coloured, and appear as well at the top of the stems as at the extremities of the lateral branches.

Three strong plants of this Franciscea, deprived of their roots, and carefully packed, were carried by mules 180 leagues before they reached Sanctos, whence they were sent to Rio Janeiro, and from that town to Europe, where they arrived, alive, in Novenber, 1847. Immediately after they were unpacked, one of them was placed in leaf-mould, unmixed with other substances; another was placed in a mixture of equal parts of some yellow earth from Brazil, and leaf-mould, with a little charcoal; the third was planted in a still more substantial soil. The last gave no signs of life; the second sent forth with difficulty a few weak shoots; the first, at the end of a month from the time it was planted, showed signs of vigour; and at the end of three months, it had sent out some fine roots, which lined the pot confining them. Guided by my success with this plant, I replanted the other two in pure leaf-mould, but they had suffered so much, that it was with difficulty they were brought round. The first, properly treated at the outset, has maintained its superiority over the other two.

The flowering period of Franciscea eximia is the same in our hothouses as in Brazil, viz., from January to June. In winter the plants, both great and small, but more especially the latter, should be kept in a temperature of from 10° to 12° Réaumur (54° to 59° F.). The period of its normal growth begins in December; the flowers are formed upon the young wood. The earliest appear on the stem and the principal branches, then on the lateral ones, where a succession is kept up for some months. The small plants, which are not more than eight or ten inches in height, have already two or three flowers at the tops of their stems. Perfection is not to be looked for until the plants are two or three years old. The original plant obtained at the exhibition of the Société de Flore, at Brussels, a medal, as the most beautiful new plant there. This same plant, which I have never used for propagation, bore in 1850 more than 300 flowers, from January to June. The flowers, which in form resemble the great Periwinkle, are richly coloured with violet, blue, and white, and contrasting as they do with the glaucous foliage behind them, produce a most beautiful effect.

The plants, if they have rooted well, may in the month of March be placed in a temperate house, in a shady and airy situation; they may be put very well in the midst of Camellias and left there all the summer; their shoots will not become blanched, their growth remains vigorous and short-jointed, their flower buds are well-formed and the flowers are abundant and last a long time. Towards the end of July, when the young wood is well ripened, the plants may be repotted. This is the best time to repot them, for if they are repotted later, they will not flower so early.

In October the plant should be again placed in the coolest place of a hothouse, where it should spend the winter. If these directions be attended to, the Franciscea eximia will be found to be easy of cultivation, and to form a valuable addition to ornamental hothouse plants.

## BRITISH SONG BIRDS.

(CAGE BIRDS, No. 13.)

No. XXIX.—Having entered my protest against the capture of nightingales, as being an act of wanton cruelty, I will now proceed to my prescribed duty, and show how to atone in the best way we can for our having deprived them of liberty. This will be best evinced in our care to provide them with a suitable domicile, and food adapted to their constitution. But first, a word or two about purchasing them, and selecting them according to their merit.

The principal dealers in these birds reside in the classic region of the "Seven Dials;" and as there is much "trickery" practised here, I will pave the way for plain sailing.

In order to make a great show of business, some of these dealers—one in particular—always collect together a number of nightingales' cages, at least 10 days before the birds arrive amongst us! These are placed on high shelves, after being artfully papered up in front with tissue paper; so as to make people believe that each cage contains a nightingale. When folks express their surprise at the birds coming over "so early," they are told—"the birds are very wild, and must not be looked at, for at least 10 days. At the end of that time they will be quite tame, and in full song." This bait is generally swallowed by *parvenus*, who keep on calling, till at last they *do* hear a nightingale sing! *Perhaps*, there are two "*real*" birds among the whole of the papered-up cages!! A little caution, and a little common prudence after this intelligible "hint," will put a novice on his guard, and enable him to appear a "knowing" one. He cannot speak too little; but he had need be "all eye, and all ear."

As April nightingales, when fresh caught, can never be depended upon for their continuance in song, their rateable value is but trifling. Five shillings is quite ample in any case, unless indeed a bird "comes out" in some remarkable manner, and sings the week through. This however is of rare occurrence. Besides, a nightingale is naturally of a sulky disposition; and if moved from one place to another, will perhaps remain dumb from that very moment. In his second season, *c'est une toute autre chose.* But *this* entirely depends upon yourself, as I shall show.

Newly-caught nightingales are what the bird-dealers call "rank." That is, they are full of snatches of rapturous song; and eager to join their mates directly on their arrival. There is no difficulty in ascertaining this latter. The voice of the lover while paying adoration to his "soul's idol," is heard both far and near. It breaks out in transports of unrestrained melody, and innocent playful joy. Then do they at once commence the arduous duties inseparable from a wedded life. The females build, lay, and go to nest, almost immediately. Hence the males, when caged, sing, not to please themselves, nor their new masters. No; every strain, every note, every inspiration they draw—all are intended for the ear of their betrothed, their first, their only love! Constancy, such as this, is rarely known. Indeed, full many of these lovely warblers fall lifeless from their perches soon after they have been caught. They sing their own "death song," in the hope that its expiring melody may reach the ears of those they so idolise, and from whom they have been so remorselessly torn. Vain hope, truly!

It is well to be deliberate in the purchase of a nightingale. Hear him, if you can, both by daylight and by candlelight. If his song be short and hurried, and given out by "snatches," he is "love-sick." Pass *him* by. If, on the contrary, you can meet with a bird loud and constant in song, and joyous withal, he is not very likely to break *his* heart for love. Buy *him* at once.

Now for the all-important consideration of the proper sort of cage for his reception. These birds, for the most part, court retirement. They come out (except in our snug, private gardens, where they sing all day) when the din and turmoil of the day are over. They seem to despise all mixing with the noisy hum and hideous hubbub of our busy world, and are seldom heard in the neighbourhood of crowded public thoroughfares. Studying his habits, therefore, let his cage be of mahogany (I have already stated where these "model cages" may be had, see "Cage Birds," No. 7). Let its length be 17 inches; height, 14 inches; depth, 11 inches. The sides, back, and top, must all be of mahogany, and the front of strong, lacquered wire, or of cane. In the centre of this, let there be a hole made, sufficiently large to give the bird's head free play when drinking; and let a tin drinking-pan be suspended immediately opposite. Tin must *not* be used for the reception of his food. Nothing is so suitable for this purpose as a *small* white earthenware circular soap-dish, which should be fitted in a mahogany frame, hung on hinges, and made so as to open outwards. Place this at one of the sides towards the back of the cage, and let it be secured by a button outside. Fit up just such a frame-work on the opposite side; and insert in the centre a circular glass-washer. See that the water in this be changed twice, at least, daily.

There must be two perches, one above, and one below. The former should be fixed as high as possible, allowing the bird just sufficient room to stand quite upright, and no more. This should run exactly across the cage, from end to end, and be immediately in the centre, so as to allow ample room for the bird's tail. The lower perch should be similarly fixed from end to end, but placed immediately behind the tin drinking-pan, say at barely two inches distance. To keep your bird quite private, a green silk curtain may be fixed on a spring roller, at the top of the cage, immediately over the wire. This could be drawn down or raised *ad libitum*. It is seldom, however, that a curtain is required.

Now for his Majesty's food. Being an insectivorous bird, the nearest assimilating diet that we can provide him is, raw *rump*-steak, all *lean*, and perfectly sweet. If tainted in the least degree, and he partakes of it, it will be all "*dick*-y" with him.

The trouble necessary to be expended upon these birds is great, yet are they worthy of it. To ensure your beef being fresh, procure it twice, daily, of your butcher. A pennyworth each time will suffice. Now for manipulating with it, and "preparing" it *selon la règle*.

All operations in connection with a nightingale's food must be performed on a circular slab of *marble*, and the naked hand must be kept at a respectful distance. Use a silver fork to hold the beef, and scrape it with a small *sharp* steel case-knife. If the rump-steak be tender and lean, as it ought to be, it will scrape "kindly." Discard from it all the fibrous matter, and place the residue on one corner of the slab. Moisten this gradually with a little cold spring water, and then mix with it some yolk of hard-boiled egg. The consistency of the whole should be moderate, neither too thin nor too solid. Either extreme is to be carefully guarded against.

Such of the above food as remains uneaten, should be thrown away about 1 P.M., and the earthenware dish, after being thoroughly scalded, should be re-filled. Not only does the meat become tainted through the excessive heat of the weather, but it is speedily rendered nauseous by the constant incursion of blow flies, whose pestiferous breath and all-but-living eggs pervade all animal matter within their sight, smell, or reach.

I must now bid adieu, for a short week, to this king of birds. The fair moon has just entered her second quarter; the nights are brilliant and inviting for a ramble; and nightingales, thank God, *are* yet to be found in the woods, the groves, and the copses. *There* I shall seek them, and drink so deeply of their floods of harmony, that I shall sing their further praises with even an increased zest. *William Kidd, New-road, Hammersmith.*

## Home Correspondence.

*Mr. Cuthill's Market Gardening Papers.*—All the world has heard of the fame of the London market men, but not every one bred and located in the country can get an opportunity to be an eye-witness of their excellent modes of cropping, based on long experience, and sought out with an anxiety sharpened by high rentals and the severity of competition. Many of our farmers, who talk so much about land wearing out, would doubtless stare to see men taking first-rate crops from a plot of ground on which, perhaps, the same kind of crop has been repeated, it may be, at least 40 times during the last 50 years. Now as these keen practitioners will not "write a book," but would rather retain a monopoly in the shrine making art for the goddess Diana, it must be admitted that Mr. Cuthill has produced a series of papers which cannot but be of eminent service both to agriculturists and horticulturists; and I can only wish that they may receive the attention they deserve. Only knowing Mr. Cuthill through the medium of his pamphlet on the Potato and other useful matters, I can but infer that he is one of those pithy characters who now and then spring up, to brush away the scum from stagnant surfaces; and to throw hitherto concealed or obscured affairs into that form so much admired by John Bull—a mere rule of three condition. Surely these papers have before this met the eyes of some of our farmers; and if so, they may tempt them to imagine that half-starved soils pay about as well as

half-starved animals; to talk about land wearing out would be a capital joke, if it were not for the fact, that it really does lay in the power of a short-sighted manager to exhaust the very best of soils, simply by bad management. Let it however be remembered, that it also lays in his power to prevent it from wearing out; and that, too, by means with which future prosperity is closely identified. "But it will not pay," says somebody, the answer to which is—"Will the opposite course pay?" If a market gardener can pay some six or eight pounds per acre for his land, and apply six times the manure, and six times the labour to his soils, that the ordinary farmer does, and yet maintain his position, what does this point to? I do not mean to argue that cultural matters can be carried so high in mere corn growing; but surely all this has a bearing on the green and root crops of the farmer at least. However, the thing is pretty obvious to those who will examine it with an impartial eye; and as "one who has whistled at the spade," I would strongly recommend all interested in high culture to run their eye over those useful papers once more, especially men who live not far from thriving towns, or with cheap railway accommodation; for if these things were more generally understood, there can be little doubt that many shrewd farmers would speedily learn to model and work out a system combining good farming and good market gardening. I hope for convenience of reference that Mr. Cuthill will republish the papers in a connected form, at the same time amplifying them, if his experience has added anything new since they last appeared. *Robert Errington, Oulton Park.*

*Scarlet Rhododendrons.*—There are perpetual notices appearing in your paper of scarlet Rhododendrons, with from 300 to 400 flowers expanded upon them at one time in the open air; and one instance in particular I noticed of a plant at Tetton, in Somersetshire, which was said in your Journal to have more than 1200 scarlet flowers out upon it at once; but flowers from this very plant were sent to me, and they were crimson. I believe the original Rhododendron arboreum, from Nepaul, is the only one which produces flowers which are really scarlet; and I also think that that has not been flowered in the open air in any part of England, except in Cornwall, where it flowers well about every other year, but not in the most favourable years in such profusion as those which I think must be erroneously named scarlet in your paper, and which I conjecture to be nothing but crimson hybrid varieties. My only reason for troubling you with this is a wish to be informed whether the Rhododendron arboreum ever flowers in any part of England in the open air, except in Cornwall; and if it does, whether it produces flowers in such profusion as the accounts in your paper would lead one think. *A. B., Cornwall.* [We apprehend that our correspondents are not careful to distinguish crimson from scarlet, not having, perhaps, very good eyes for colour.]

*Young Plantations.*—Assuredly the case of which "J. D." complains so much, at page 261, must be a solitary one; for the majority of young plantations planted during the last 20 years have been tolerably well treated, unless in cases where embarrassed circumstances, or perhaps caprice, induced the proprietor to delay thinning them until it could hardly be performed at all in a satisfactory way; on the other hand, however, I have seen much mischief effected by beginning to thin too soon. I have seen a healthy lot of green Firs, not more than six years planted, almost spoiled for ever by being denuded of their under branches, in order that the ground might undergo a sort of tillage, which certain rules of husbandry are said to require to keep it sweet, pervious, and healthy; and in some favourite plantations I have seen this evil carried to such an extent as to give an unequivocal token of the mischief that was going on. The roots of the Pinus tribe all lie near the surface, and each successive digging destroys what may have been formed since the previous digging, which are, by-the-bye, the most useful roots which the plant has. Well, this root pruning goes on year after year, until the tree, having obtained some size, is forced into a reclining position by the wind, its roots being so far reduced as to offer no impediment to the gale. Now, in this case the evil lies in the commission, and not in the omission of, a worse than useless duty; but the great mass of young plantations are more liable to suffer from neglect than from an over performance of those offices, which we are led to believe assists Nature in her course; but no set of rules or code of laws can be laid down as to the when and where thinning ought to begin and where to end, for so much depends on local circumstances, the purposes for which the timber is required, and the other contingencies, that what may appear to be absurd in one case is both proper and beneficial in another; for instance, I have seen trees planted at the rate of something like 12,000 per acre upon ground that had been in tillage, and in tolerably good condition; now, except hoeing the weeds the first two or three seasons, nothing whatever was done until the 14th year, not a twig was taken off, and not a tree cut out. From this the general reader, knowing no more of the matter than here expressed, would conclude that the plantation was irrecoverably spoiled; nothing of the kind however happened, it is then just ripe for the purposes for which it is wanted, and it usually sells from 40*l.* to 70*l.* per acre. It is then wholly cut down, the stumps are grubbed up, and the land undergoes a course of husbandry previous to planting another time. This plan is only carried out in the case of Larch Firs, for Hop-poles, and few crops pay better; timber certainly never pays so well; in fact, except in those districts where there is great local demand for the common kinds of timber, I fear it can hardly ever again be expected to be planted with a view to profitable investment. The facilities which the last few years have given of obtaining foreign timber at a reasonable rate, and its being more applicable to our wants than our own timber, must tend to drive the latter out of the market, except in those inland districts where a long heavy carriage operates against the foreign article. But to my subject; I have stated that plantations are sometimes spoiled by a too early application of edged tools. This is not, however, always the case; but where young trees have been allowed to draw each other up to an unwieldy height, thinning then must be carefully and very gradually performed, and it is wonderful how the trees are left to appreciate the enlarged breathing room allotted them. One thing in regard to hard-wooded trees, I may mention; prune very little, if any, from the Sycamore, unless it be in August; if in the spring, or, in fact, any time in the winter, that a limb is taken off, the tree will lose an immense deal of sap. No resinous tree that I am acquainted with bleeds more, although it does not leave large lumps of gum hanging round the wound, to denote the cruelty to which it has been subjected. August is likewise the best month to prune any green Firs that necessity (for I will not admit any other reason) compels you to prune; and, in fact, I am unacquainted with any tree likely to take harm from being cut at that season. While on this subject allow me to suggest to those planting Fir timber, for profitable uses, the expediency of planting it alone, and of not being too hasty in thinning it; for most purposes for which this kind of timber is wanted, a clear straight stem, carrying its thickness a good way up, is what is desirable; and if the trees do not stand middling thick, they will not attain this desideratum. Of course, a reasonable degree of thinning must be observed, but do not overdo it; a large plantation of Scotch or Spruce Fir is both interesting and useful. Of the kinds of timber likely hereafter to become scarce, I think Beech will wear out first, being of slow growth, and not used for many purposes where large timber is wanted; and more than that, not selling well, few are inclined to plant it. Yet, for the uses to which it is put, it will be difficult to find a substitute; not easily split, it is useful for many purposes, for which its resistance to cleave makes it desirable. Wheel felloes, and many kinds of millwright work, as well as cart axletrees, &c., create a much greater demand for Beech than I think the supply can hereafter afford; its place, however, may possibly be supplied by some foreign production, as that of British Oak has, in a great measure, been of late, in its duties of farming, the most formidable bulwark of our national defences. *An Old Sawyer.*

*Ants.*—Last year I sought advice as to the best mode of getting rid of ants, which have infested my house for some two or three years past, marching along the outer walls in direct lines to the house, and by the windows and chinks getting into the kitchen and sitting rooms, infecting everything they run upon or into, and destroying one's comfort; sometimes in one's food, and sometimes over the curtains, carpets, &c. I received many kind answers; some to try cloths dipped in spirits of turpentine, others arsenic and cheese or honey, but all to no effect. I have even taken down part of the skirting board of my kitchen, and from the plaster of the walls they issue out of holes like wasps from a bank. What shall I do? Can I puff sulphur in, and stop the holes with cement and paint, or will spirits of turpentine stuffed in and covered over suffocate them? I am afraid the plaster of the house on the walls must be full of them. What advice can you give to eradicate these plagues? *Northwood.* [Ants will not endure the vapour of turpentine; nor will they eat through cement; but if the walls are really full of them, we fear they will never depart until the walls are wholly cased in the same impenetrable substance.]

*Cryptomeria japonica.*—I presume by its present price others have found that this tree will grow from seed ripened in England. One of my plants, which had been kept three or four years in a pot, was planted out two years ago, and last year it ripened about half a pint of cones. The seed from these was sown in the greenhouse, and is now coming up abundantly, though the mice made sad work with it soon after it was sown. It may, doubtless, in a few years be also common as the Larch, if its timber proves of any value. It is quite as quick of growth, if not quicker, to judge from those I have planted. *J. Rogers, Sevenoaks.*

*Renovating old Trees.*—Some years ago, the hollow trunk of an old Oak, at a village in Buckinghamshire, was taken possession of by a swarm of bees. Some of the villagers thought it good to take the honey, and to that end they lighted a fire inside the trunk, for the purpose of smoking out the bees. The trunk was coated within with touchwood; this soon took fire, and the whole tree would probably have been consumed, had it not suddenly occurred to the bystanders, that these proceedings might not be altogether pleasing to the owner. This reflection induced them to put out the fire, which they did, with all speed, by the help of the parish fire-engine. Now, the Oak had long been in a very languishing state, which was no wonder, for the girth of the trunk is fully 20 ft., which large size, on a light gravel, probably implies an age of many centuries. However, old and failing as the tree was, the treatment thus described wholly cured it of sickliness. The leaves became plentiful and well grown, and have been so each year since: the acorns, too, have been very numerous. The fire, I suppose, did good by destroying the touchwood; and the water started the roots into more vigorous action. The account I give is perfectly authentic. I was not an eye-witness of the process that revived the tree—but I can testify that it is now as flourishing as so old a tree, and so completely hollow, well can be. *F. J. Moule, Chenies, Bucks.*

*Onions.*—Cottagers and others desirous of obtaining a good and early crop of Onions next year should immediately begin to prepare for it, by sowing an ounce or two of seed very thickly, on a small bed and good soil. By being sown very thickly they will be very small; and by being very small, they will be all the better for the purpose they are intended. When they are harvested, the largest should be separated from the smallest. The former might be used for pickling, and the latter should be stored away till February, when they should be planted 1 inch deep and 5 inches apart every way, in good soil. Early in summer they will produce an excellent crop of fine large Onions. This plan may be old to some, but it may be new to others. *W. G. Eydon, Daventry.*

*Vines in Pots.*—The Huddersfield Floral and Horticultural Society, with the intention of encouraging the cultivation of Vines in pots, offer prizes for their production. Several gardeners in the neighbourhood, who intend competing for this prize, have put pots to the base of last year's wood (this wood of course showing fruit), and let the roots thrown out from the Vine, root into the pot; so that it is supported not only by its own roots, but also by the old Vine. They will be left attached to the old Vine until the day of exhibition, when they will be cut off, and shown as Vines grown in pots. Should Vines thus grown be allowed to compete with those produced from buds or cuttings? *A Subscriber.* [All Vines thus exhibited should be put aside by the judges, as having been produced contrary to the rules. How can they be said to have been *grown* in pots?]

*The Calceolaria* (see p. 278).—I find that Mr. Rumley has made various objections to my system of propagating and growing the Calceolaria. My intention was simply to show the general utility of this plant, for decorative purposes, and at the same time to point out the facility with which it might be grown for that particular object. Every gardener has "a way of his own," and, of course, others must consider the effect that climate, soil, and other circumstances, may have on the growth and flowering of plants. My way of propagating is by seed, as it is evident that the finest specimens are made of seedlings; while Mr. R. asserts that the flowers produced upon plants raised from cuttings are far superior, and that the majority of plants raised from seed are worthless; if care, however, is taken at the time of hybridising, to select the most distinct varieties, the disappointment will not be met with that he anticipates. To save a considerable degree of trouble and expense, it is far preferable to shift the young plants, when well established in small pots, into those they are to occupy at the time of flowering, without the intermediate shifting which Mr. R. proposes, and which, I think, is unnecessary. In my opinion, Mr. R. is wrong in placing saucers of liquid manure under his pots; he should bear in mind that the Calceolaria is more susceptible of injury from too much watering than most plants in general cultivation. The soil becomes saturated and sour, and the affair generally ends in the destruction of the plants, if immediate precautions are not taken to counteract the evil. I prepare a good porous compost, through which water can percolate freely, so that an abundant supply can always be given without fear of hurting the plants, and this proves more beneficial than placing saucers of liquid manure beneath the pots. Lastly, when you can keep your plants in a good state of health, and constantly syringe them till the development of the flower commences, you will keep them free of insects; but if it happens that they are attacked by green-fly, of course it is unnecessary for me to state that fumigating with tobacco is the best preventive, when cautiously applied. *M. P.*

## Societies.

HORTICULTURAL: GARDEN EXHIBITION, *May* 3.—The leading features of this grand display of horticultural skill being adverted to in another column, we will confine ourselves here to describing the scene in detail.

In collections of 20 STOVE and GREENHOUSE PLANTS, the Large Gold Medal was awarded to Mr. May, gr. to Mrs. Lawrence, of Ealing Park. At the back of this group stood an enormous example of the large-flowered Epacris; an Azalea, profusely clothed with double flowers of the richest red; a white blossomed Heath, two varieties of Eriostemon, one forming a cylinder of little white stars at least 7 feet high; two Polygalas, the white variety of Erica vestita, two Chorozemas, the beautiful Boronias pinnata and serrulata, the useful Podolobium staurophyllum; a Pimelea spectabilis, forming a ball of flowers 5 feet in diameter; the Baxter Leschenault, the Java Ixora, most beautifully blossomed; the Cels Hovea, Gompholobium polymorphum, a red Azalea, and Pultenæa stipularis.—Another collection of 20 was contributed by Mr. Cole, gr. to H. Colyer Esq., of Dartford. It comprised a huge example of the imperial Hoya, in finer condition, perhaps, than it has ever before been seen in a pot; the Box and Oleander-leaved Eriostemons; Dillwynia juniperina, two Polygalas, the pretty Cape Heath called

favoides elegans, Clerodendron splendens, unusually well flowered; the Cels Hovea, in charming condition; an Everlasting, Murray's Azalea, the scarlet and saffron Ixoras, Leschenaultia formosa, Franciscea acuminata, loaded with blossoms, which shed a most delicious perfume; a double-red Azalea, Podolobium staurophyllum, Mrs. Lawrence's beautiful variety of Chorozema, and a Cape Heath.—Groups of 20 plants were also contributed by Messrs. Frazer and Pamplin. The former had the Broughton Azalea, Eriostemon myoporoides, the Berberry-leaved Podolobe, Pimelea linifolia, a large variety of the Baxter Leschenault, the Boronias serrulata and pinnata, Eriostemon cuspidatum, three Chorozemas, Polygala acuminata, a badly-flowered example of the blue Leschenault, an Everlasting, the Oleander-leaved Eriostemon, the lovely Erica propendens, the glowing Azalea "Minerva," the showy Adenandra, and two Cape Heaths.—Mr. Pamplin sent four Cape Heaths, three varieties of Azalea, the opposite-leaved Polygala, Pimelea lanata and P. spectabilis, the latter insufficiently in flower; Euphorbia splendens, the Box-leaved Eriostemon, Dillwynia juniperina, the Cels Hovea, a handsome bush of the useful Genista racemosa, and one or two other plants.

There were two collections of 15 STOVE and GREENHOUSE PLANTS. The first was communicated by Mr. Green, gr. to Sir E. Antrobus, Bart. It consisted of a pretty specimen of the large-blossomed Epacris, two Polygalas, the variegated and other Azaleas, two Everlastings, the scarlet and saffron Ixoras, Boronia serrulata, the blue Leschenault, Æschynanthus Boschianus, Boronia pinnata, the dwarf variety of Chorozema varium, and Leschenaultia formosa.—The second group was contributed by Mr. Taylor, gr. to J. Coster, Esq. of Streatham. It comprised the showy Adenandra, three Azaleas, Hoya carnosa, Erica elegans, two Everlastings, Leschenaultia formosa, a large example of the opposite-leaved Polygala, the sweet-smelling Dracophyllum gracile, Boronia pinnata, the charming Erica propendens, Polygala cordifolia, Pimelea spectabilis, and Eriostemon myoporoides.

Seven collections of 10 STOVE and GREENHOUSE PLANTS were exhibited. The first was produced by Mr. Carson, gr. to W. F. G. Farmer, Esq., of Nonesuch Park, Cheam. It contained the scarlet Ixora, two Azaleas, the showy Pimelea, Franciscea augusta and the broad-leaved species, Leschenaultia formosa, the showy Adenandra, Oxylobium Pultenæa, and the Anemone-leaved Boronia.—Mr. Speed, of Edmonton, sent the second best group, which consisted of the charming Erica propendens, Leschenaultia formosa, the Box-leaved Eriostemon, the Henderson Pimelea, Clerodendron fallax, famously flowered; Eutaxia pungens, a white blossomed Heath, the beautiful Tetratheca verticillata, Vinca rosea in admirable condition, and a nice bush of Mrs. Lawrence's Chorozema.—The next collection in point of merit came from Mr. Croxford, gr. to H. H. Barnes, Esq., of Stamford-hill. It contained the Henderson and showy Pimeleas, Chorozema varium, an Everlasting, a neat plant of the Box-leaved Eriostemon, the Lawrence Chorozema, Erica propendens, a large Epacris grandiflora, the Baxter Leschenault, and the showy Adenandra.—Mr. Williams, gr. to C. B. Warner, Esq., had the broad-leaved Cytisus, an Everlasting, a white Azalea, and a vivid red kind, called Prince Albert; the useful winter-flowering Acacia armata, the large blossomed Epacris, the showy and Henderson Pimeleas, Cyrtoceras reflexum, and the Jarrat Tropæolum.—Groups of 10 were also furnished by Messrs. Dods, Over, and Watson, prizes being awarded for them in the order in which the names occur. Among these we remarked the showy Æschynanth, the Oleander-leaved Eriostemon, Epacris pulchella, the Polygala called Dalmaisiana, Zichya longipedunculata, Hoya campanulata, which is reported to be deliciously sweet-scented at night; the pretty Erica Sindryana, and a few more common plants.

There were four collections of 6 STOVE and GREENHOUSE PLANTS. Mr. Kinghorn, gr. to the Earl of Kilmorey, sent the brilliant Azalea optima, forming a pyramid some 5 feet in height; Epacris miniata, which is still the best of the red kinds; the Hartnell Heath, a badly bloomed Leschenaultia formosa, an Everlasting, and Adenandra uniflora.—The next best 6 plants were Oxylobium Pultenæa, an Everlasting, the Box-leaved Eriostemon, Azalea præstantissima, the scarlet Ixora, and the Anemone-leaved Boronia, from Mr. Hamp, gr. to J. Thorne, Esq., of Mawbey-house, South Lambeth.—Mr. Stewart, gr. to T. Huggins, Esq., of Norwood, contributed Polygala acuminata, an Everlasting, Zichya longipedunculata, the reflexed Cyrtoceras, the Intermediate Heath, and Chorozema varium nanum.—Mr. Stanly, gr. to H. Berens, Esq., of Sidcup, Kent, produced Zichya inophylla, the large-flowered Epacris, Cyrtoceras reflexum; the opposite-leaved Polygala, the dwarf variety of Erica perspicua, and the broad-leaved Daviesia.

ORCHIDS.—These were very numerous and fine. Mr. Mylam, gr., to S. Rucker, Esq., received the Large Gold Medal for a collection of 20 plants, among which we remarked the fringed Dendrobe, forming a bush of flowers 4 feet high by 3 feet through; the Noble Dendrobe equally fine; the three-coloured Vanda, with 5 beautiful spikes of blossoms; the showy Oncidium ampliatum, the close-flowered Dendrobe, bearing some dozen racemes of flowers; a well managed Chysis bractescens; the Skinner Cattleya, in beautiful condition; the violet Schomburgkia, the sweet Vanda, the Devonshire Dendrobe, one of the most handsome of the genus; the charming white Butterfly Plant; Lycaste cruenta; the spotted Saccolabe, Vanda cristata, the yellow blossomed Dendrobium aggregatum, the two-coloured Leptotes, Aerides suavissimum, Dendrobium pulchellum, and a famous specimen of Epidendrum inversum, which, when well flowered, as this was, is really much prettier than it is usually considered to be.—The next group in point of merit was produced by Mr. Blake, gr. to J. H. Schröder, Esq., of Stratford, it contained the three-coloured Vanda; a good specimen of Calanthe veratrifolia; the Wallich Phaius, bearing 7 stately flower spikes, the useful Oncidium ampliatum, the Oncidium phymatochilum, the lance-leaved Cymbid, a Schomburgkia, Dendrobium pulchellum, Vanda cristata, Chysis bractescens, the lovely Phalænopsis and its large blossomed variety; the close flowered Dendrobe, Oncidium bifolium, the bearded Lady's Slipper, with some 20 open flowers on it; the spotted Saccolabe, Dendrobium chrysanthum, a small plant of the fragrant Burlingtonia, a very fine specimen of the twisted Trichopil, and an example of the Skinner Cattleya, bearing 9 spikes of brilliant purple flowers.—A third group was produced by Mr. Williams, gr. to C. B. Warner, Esq., of Hoddesdon. In this we observed an Arpophyl with just sufficient flower-spike to show what a beautiful object a well blossomed specimen would be; Ansellia Africana, from Fernando Po; the slender-leaved Maxillaria; the Devonshire Dendrobe; the larger variety of the spotted Brassia; Dendrobium pulchellum; the large flowered white Butterfly Plant; Wallich's Dendrobe, forming a bush 3 feet high, and as much through; the Skinner and intermediate Cattleyas; Wallich's Phaius, the Rhubarb-scented Dendrobium macrophyllum, Oncidium phymatochilum, and the two-leaved kind; the close flowered and Farmer Dendrobes, Low's Lady's Slipper, the more common bearded kind, and the pretty Epidendium bicornutum.

ORCHIDS, in collections of 15, were shown by Messrs. Veitch and Rollisson. The former had the Devonshire Dendrobe, not tied up, as it sometimes is, but hanging gracefully over the sides of the basket which contained it; the sweet Vanda, bearing two great flower spikes; a variety of Dendrobium Pierardi, quite a fountain of blossoms, falling in continuous streams 5 feet, at least, below the wire basin from which they issued; the best variety of Oncidium ampliatum; the Noble Dendrobe, 4 feet high, and about as much through; two kinds of Aerides; the yellow-blossomed Dendrobium aggregatum; the long-tailed Lady's Slipper, with the different colours better "brought out" than we have ever before seen them; the twisted Dendrobe, the lovely Phalænopsis and its large-blossomed variety, Dendrobium moniliforme, the close-flowered kind, and an example of the bearded Lady's Slipper.—In Messrs. Rollisson's group were Humboldt's Acinete, with two spikes of open flowers, and others still unexpanded; Oncidium pictum; the Noble Dendrobe, in the shape of a bush, some 4 feet high by 4 feet wide; Barker's Acinete, the Paxton and fringed Dendrobes, Lycaste cruenta and Deppei, Oncidium phymatochilum, and the larger variety of O. ampliatum, Brassia brachiata, the close-flowered and Devonshire Dendrobes, and the somewhat scarce Burlingtonia rigida.

Ten ORCHIDS were contributed by Mr. Franklin, gr. to Mrs. Lawrence, and Mr. Carson, gr. to W. F. G. Farmer, Esq. In the former group were the three-coloured Vanda, a well-flowered example of the noble Dendrobe, the lovely Phalænopsis and its large blossomed variety, the two-leaved Oncid, a rosy tinged Aerides affine, Dendrobium cærulescens, the Moss Cattleya, the best variety of the intermediate Cattleya, the Skinner Cattleya charmingly flowered, a small Chysis bractescens, and the Aloe-leaved Epidendrum.

The best collection of six ORCHIDS was shown by Mr. Kinghorn, gr. to the Earl of Kilmorey. It consisted of Calanthe veratrifolia, the large-flowered white Butterfly Plant, Dendrobium macrophyllum, a fine plant of the Bauer Oncid, a stately specimen of the Tankerville Phaius, and a fair example of the noble Dendrobe.—Mr. Green sent the broad-leaved Epidendrum, two well-flowered Oncids, the noble Dendrobe, 3 feet high, and the same in width, Burlingtonia rigida; and Epidendrum macrophyllum.—Mr. Wooley, gr. to H. B. Ker, Esq., of Cheshunt, had Calanthe veratrifolia, Phaius grandifolius, the broad-leaved Epidendrum, a fine Dendrobium cærulescens, the yellow-lipped Cyrtochilum filipes, and the larger variety of the spotted Brassia.—Mr. Ivison, gr. to the Duchess Dowager of Northumberland, sent three Oncids, the noble Dendrobe, the Clowes Anguloa, and the Wray Brassia.

AZALEAS were numerous, large, and fine; and they made, as they always do at the May show, a very striking display. Two excellent collections of 12 plants were produced, one from Mr. Green, gr. to Sir E. Antrobus, Bart., the other from Mrs. Lawrence, of Ealing Park. Mr. Green had huge specimens of Double Red, Gledstanesi, lateritia, præstantissima, vivicans, sinensis, coronata, exquisita, optima, triumphans, variegata, and Rawsoni.—Mrs. Lawrence sent fine bushes of optima, Gledstanesi, præstantissima, coronata, Rawsoni, variegata, speciosissima, rosea superba, Lawrenceana, exquisita, sinensis, and lateritia.—Groups of six plants were furnished by Messrs. Carson and Frazer. Among these we remarked pulchra, Double Red, Gledstanesi, lateritia, variegata, speciosissima, splendens, Fielder's White, violacea superba, Smith's Red, and the Chinese Yellow.

A collection of tall CACTI in flower was exhibited by Mr. Green. It contained Epiphyllum speciosum, E. rubrum cœruleum, Ackermanni, E. aurantiacum, E. Russellianum, and Cereus speciosissimus.

RHODODENDRONS.—A magnificent collection was shown by Mr. Ivison, gr. to the Duchess Dowager of Northumberland, at Sion House. It consisted of beautiful light and purple flowered kinds. The best of the former were stated to have been obtained between altaclerense and the white ponticum, the others between altaclerense and the white tree Rhododendron.

ROSES IN POTS surpassed any exhibition of the kind we have hitherto seen. The collections of both dealers and amateurs showed that each had done his utmost, and the result is that the cultivation of the "Queen of Flowers" in pots, has attained a degree of perfection beyond which it can hardly be expected to be carried. Nothwithstanding the little sun we have had, the flowers were beautifully coloured, especially those on Messrs. Lanes' plants, and the foliage was ample and clean. The gems of Mr. Francis's collection, to whom the first prize was awarded, were Paul Perras, with blossoms regularly dispersed over the plant, large and well blown; Coupe d'Hébé, with flowers rich in shape and colour, reminding one of those of the old fashioned Cabbage; Lamarque a good white, and said to be beautifully scented; Armosa, a profuse blooming medium-sized Rose; Chenédolé, and La Reine. We observed in all instances that the buds of the latter did not open kindly. Madame de St. Joseph, in Messrs. Paul's group, which was second, was the admiration of everybody. It is a delicate salmon, with a delicious fragrance, and the plant was covered with blossoms; Vicomtesse des Cazes had been very fine, but its beauty was somewhat on the wane; not so Niphetos, which was just in perfection, and studded with flowers of snowy whiteness; William Jesse and Comte de Paris were also in beautiful condition. Messrs. Lane's plants were insufficiently in bloom; three or four more bright days might have placed them in a different position. Among them were the universal favourites, William Jesse, Duchess of Sutherland, Aubernon, with foliage broad and clean; and the glorious Géant des Batailles. The first of these possessed a surprisingly fine colour for the season. In the collections of Messrs. Terry, Rozer, and Rowland, were Aubernon, Fulgorie, Mrs. Bosanquet, Nina, Marquise Boccella, La Reine, Armosa, Géant des Batailles, Blairii No. 2, Augustine Mouchelet, Duchess of Sutherland, Goubault, William Jesse, and Baronne Prevost, the latter with flowers at least 6 inches in diameter.

CAPE HEATHS were numerous, and generally finely flowered. Excellent plants were furnished by Mr. Smith, Mr. Cole, Mr. Over, Mr. Roser, Mr. Taylor, Mr. Stewart; and in the Nurserymen's class by Messrs. Rollisson, Epps, Fairbairn, and Pamplin. The specimens, both in 11 and 8 inch pots, were famous examples of good Heath growing. In the different collections we remarked the following varieties: tortiliflora, fastigiata lutescens, suaveolens, ampullacea carminbrata and vittata, ventricosa superba, coccinea minor, propendens, favoides elegans, mutabilis, mundula, dilecta, aristata major, Beaumontiana, perspicua nana, M'Nabiana, dentieulata moschata, elegans, vasiflora, Sprengeli, Hartnelli, andromedæflora, triumphans, viridis, Sindryana, primuloides, odora rosæ, florida, campanulata, Cavendishii, mirabilis, Thunbergiana, depressa, and Webbiana.

EPACRISES.—A collection was shown by Mr. Smith, gr. to W. Quilter, Esq., of Norwood. It consisted of miniata, Attleeana, grandiflora, Smith's seedling, and one or two other kinds.

SINGLE SPECIMENS.—The best consisted of two plants of the glorious Medinilla magnifica, and a fine bush of Erica elegans from Messrs. Veitch; a beautiful example of Erica Sindryana from T. B. Graham, Esq., of Lavender Sweep, Clapham Common; the charming Chinese Indigofera decora from Mr. Ivison, gr. to the Duchess Dowager of Northumberland, at Sion; and a nice plant of the Griffith Ixora from Mr. Green. In addition to these, Messrs. Veitch furnished the Jasmine-flowered Rhododendron; Mr. Cole, the Cels Hovea; Mr. May, Boronia serrulata; Mr. Stewart, Physolobium gracile; Messrs. Fairbairn, Erica favoides elegans; and Mr. Stanly, E. Hartnelli.

Some interesting novelties were produced. Messrs. Veitch had their lovely Cantua dependens; M. Baumann, of Ghent, Deutzia gracilis, a white-flowered, slender growing hardy shrub, from Japan; Mr. Loddiges, an Aerides, with long racemes of gay rose-coloured blossoms, and a new Lycaste, from Bolivia, with pale yellow flowers; Messrs. Henderson, the Broughtonia violacea; Mr. Franklin, gr. to Mrs. Lawrence, an Epidendrum; Mr. Carson, Trichopilia coccinea, a promising species, with a large dark red coloured lip; Mr. Cole, the Oleander-leaved Allamanda; Mr. May, gr. to Mrs. Lawrence, Pimelea Nieppergiana; and M. de Jonghe, of Brussels, a rather handsome Billbergia. These, together with two or three other plants, either not new or unimportant, constituted all that were exhibited in this class.

Among MISCELLANEOUS SUBJECTS were interesting examples of Nepenthes Rafflesiana and sanguinea from Messrs. Veitch, a collection of seedling Amaryllids from Mr. Hamp, Lycopods from Mr. Wooley, gr. to H. B. Ker, Esq.; a beautiful variety of Epiphyllum speciosum called Brookii, from Mr. Hoyle, of Reading; and

a small collection of Alpines in pots from Mr. Turner, of Holloway.

Pelargoniums were entirely confined to "Fancies" and "Capes," both of which are advancing rapidly in public favour; and, when we consider the variety of colours to be found in the latter, the curious stains and markings of the former, together with their profuse flowering habit, this growing change in their favour is not to be wondered at. Fancies were produced in admirable condition by Mr. Ayres, of Brooklands, Blackheath, and Mr. Ambrose, of Battersea. In the former group, whose flowers were large and fresh, were Queen Superb, Statinski, picturatum, Hero of Surrey, Alboni, and Gipsy Queen.—Mr. Ambrose had picturatum, Defiance, Madame Meillez, Ibraham Pacha, Formosum, and Anais.—Mr. Roser's Cape species were well grown and very attractive.

Cinerarias.—Mr. Robinson, of Pimlico, had a nice collection, consisting of Newington Beauty, Flora M'Ivor, Bessy, Angelique, Annie, and Fairy Ring. — Groups were also produced by Mr. Fancourt, Foreman to Mr. Cant, of Colchester, and Messrs. Lane, of Great Berkhamstead; that from the latter was disqualified on account of its not having been shown according to the regulations.

Pansies in pots were exhibited by Mr. Bragg and Mr. Turner, of Slough; the latter not for competition. It was predicted that this mode of showing Pansies would prove a failure; but so far from that being the case, we imagine that before long, the system must be universally adopted, so tasteful and effective were those exhibited on Saturday last.—Mr. Bragg's varieties were, Ophir, Mr. Beck, Polyphemus, Constellation, Junius, Conspicua, Juventa, Madame Sontag, Eliza Ann, Queen of England, Lady Carrington, and Flying Dutchman.—Mr. Turner's plants were well bloomed, and the flowers were as large and fine as those usually produced in a cut state. The sorts were, Juventa, Polyphemus, Queen of England, Surplice, Mr. Beck, Mrs. Hamilton, Thisbe, Almanzor, Swansdown, Constantine, Leader, Ophir, Goliah, Euphemia, Duke of Norfolk, Disraeli, Constellation, Aurora, Bellona, and Supreme.

Auriculas were furnished (not for competition) by Mr. Turner, of Slough, and Mr. Willmer, of Sunbury. In their respective collections we observed Lovely Ann, Ringleader, Champion, Mary Ann, Conqueror of Europe, True Briton, fine (Hepworth); Countess of Wilton (Cheetham), 'Squire Chilman, Earl Grosvenor, Colonel Taylor, Fair Maid, Lancashire Hero (Cheetham), very fine.

In the tent provided for seedlings Messrs. E. G. Henderson, of the Wellington-road Nursery, had a fine collection of new Cinerarias, containing Lady Hume Campbell, white, edged with blue; Marianne, white, tipped with rosy lilac, good in form; Dora, white with lilac disk, but wanting in substance, and Prince Arthur, bright rosy purple.—Mr. Hoyle sent Pelargoniums; Chieftain, in fine condition, it is a dark crimson blotch, lower petals clear rosy crimson; Magnet, brilliant purple crimson, with dark blotch—a fine, bold, free-flowering variety, possessing great substance.—Mr. Kinghorn had an Epacris, named Conspicua, a free-flowering kind, in the way of grandiflora, but a considerable improvement on that variety.

Everlastings:—The best collections were shown by Mr. Taylor and Mr. Green. In these we remarked Aphelexis macrantha purpurea grandiflora, A. m. rosea, A. humilis, A. spectabilis, and A. sesamoides rosea.

Fruit was scarce—a circumstance to be attributed to the long cold spring which we have experienced. Mr. Bray, gr. to E. Lousada, Esq., sent a beautifully swelled Queen Pine-apple, weighing 3 lbs. 3 ozs.; four Queens, all nice fruit, though not remarkable for great weights, were furnished by Mr. Barnes, gr. to Lady Rolle at Bicton. Mr. Davis, gr. to Lady Bridport, produced two handsome Black Prince Pines on two suckers on a stool in a pot, which also contained a third suckers, bearing a fruit about half swelled. Mr. Barnes sent a Prickly Cayenne, weighing 4 lbs. 10 oz.; and Mr. Fleming, gr. to the Duke of Sutherland, at Trentham, a Black Antigua, 3 lbs. 4 oz. A Providence, 8 lbs. 4 oz., was exhibited by Mr. Davis, gr. to Lord Boston. The same kind of Pine, 7 lbs. 9 oz., was also shown by Mr. Jackson, gr. to H. Beaufoy, Esq., of South Lambeth; and Mr. Bray sent a similar variety, weighing 5 lbs. 1 oz. Exhibitions of Black Hamburgh Grapes were pretty numerous, and, considering the season, they were well coloured and swelled. The best were produced by Mr. Fleming, and Mr. Davis, of Oak Hill, and the second best by Mr. Parsons, of Ponder's End, and Mr. Davis, of Starch Green, Hammersmith, while good examples of the same kind of Grape were contributed by Mr. Bain, gr. to B. Bernasconi, Esq., of Harrow Weald. The same variety of Grape was also communicated by Mr. Robertson, gr. to Lady E. Foley, Stoke Edith Park, Ledbury; Mr. Turnbull, gr. to the Duke of Marlborough, at Blenheim; Mr. Munro, gr. to Miss Oddie, Colney-house, St. Alban's; and Mr. M'Kay, gr. at Fairlawn-house, Acton Green; Mr. Jackson, gr. to H. Beaufoy, Esq., produced Dutch Sweetwater, and the same variety was also shown by Mr. Davis, of Oak Hill. Mr. Bain had white Frontignans; Mr. Robertson and Mr. Henderson, Muscadines; and Mr. Munro and Mr. M'Walter, Sweetwaters. Apples and Pears were exhibited in excellent condition by Mr. Snow, gr. to the Earl de Grey, and Mr. Stanly, gr. to H. Berens, Esq. Among Apples in the former exhibition, we remarked the Alfriston, named New England Pippin; Boston Russet, with no russet on it; Ribston Pippin highly coloured; and fine specimens of Blenheim Orange. Among Pears there were good examples of Uvedale's St. Germain and old Colmar, which is still one of the best Pears we have at this season of the year. Among Mr. Stanly's Apples, were very fine looking examples of Blenheim Orange and Ribston Pippin; Mr. Elliott, gardener to Mrs. Boothby, also sent a good collection of Apples and Pears. Fine dishes, for the season, of May Duke Cherries were shown by Mr. Ingram, gr. to Her Majesty at Frogmore, and by Mr. Fleming, of Trentham. Keens' seedling Strawberries were exhibited by Mr. Turnbull, gr. to the Duke of Marlborough; by Mr. Elliott, gr. to Mrs. Boothby; and by Mr. Smith, of Isleworth; British Queen and Alice Maude, by Mr. M'Walter, gr. to Col. Challoner; and the latter also showed British Queens in pots. —Mr. Grant, gr. to J. H. Simms, Esq., received a 1st prize for a Melon named "Victory of Bath." It was an obovate medium-sized cream-coloured white-fleshed sort, said to have been raised between Mr. Fleming's Hybrid Persian and the Bromham Hall, and of most excellent quality.—Mr. Robertson, gr. to Lady Foley, had a Hybrid Persian, to which a second prize was awarded.—Mr. Meredith, gr. to the Duke of Sutherland, at Cleifden, also sent a Hybrid Melon.—Orange trees in fruit were shown by Mr. Stanly and Mr. Watson.

National Floricultural, *May 8.*—Cinerarias formed the chief objects of exhibition to-day. Interesting collections of these were furnished by Messrs. Henderson, of Pine-apple-place, and Mr. E. G. Henderson, of the Wellington-road Nursery. The latter had also the beautiful new sorts Lady Hume Campbell, Marianne, and Mrs. Sidney Herbert. Three blooms of Epiphyllums were shown by Mr. Willison, of Whitby; a flower of a red Azalea, by Mr. Catiel, of Liverpool; cut specimens of three Calceolarias, by Messrs. Schofield, of Leeds; and promising Pansy blooms, from Messrs. Youell, of Yarmouth and the Rev. J. H. Gossett. Messrs. Henderson sent a Pelargonium called White Unique; an Amaryllis, and a pretty Cape Heath named Victoria. Three Cinerarias were produced by Messrs. Widnall and Co., of Granchester, and a similar number by Messrs. Ivery, of Dorking. Eight varieties of this useful flower were also exhibited by Mr. E. G. Henderson, of Wellington-road, and some two dozen kinds by Mr. Jeyes, of Northampton. The latter also sent two sorts of Azalea; A. magnifica, loaded with semi-double purple flowers, was contributed by Messrs. Henderson; and Mr. Reed, gr. to W. A. Coombe, Esq., of Northfleet, sent A. pictura, a white variety, striped with rosy purple. This was worked on a plant of A. refulgens; and both being in flower at the same time, caused one side of the specimen to be red while the other was white. Pansies were communicated by Mr. Bragg, of Slough; two promising fancy Pelargoniums, and a Cineraria by Mr. Ayres; a Cineraria by Mr. Lockner; a variety of Erica tricolor by Mr. Epps, and Pelargonium "Lilac Unique" by Mr. Ivery, of Peckham, who had also two Cinerarias. We omitted to state in our last report that Mr. Ayres received a *first*-class Certificate for his Fancy Pelargonium Formosissimum.

Hammersmith Heartsease, *May 7th.*—1st prize, 36 blooms, Mr. C. Turner, Slough; 2, Mr. Bragg, Slough; 3, Mr. T. Thomson, Iver. Amateurs, 24 blooms.—Equal, 1, Mr. Treacher and Mr. Lane, both of Wycombe; 2, J. Edwards, Esq., Holloway; 3d, M. Brown, Esq., Tulse-hill. We remarked the following in fine condition: Almanzor (Thomson), Ophir (Widnall), Polyphemus (Thomson), Commander-in-Chief (Youell), Constantine (Turner), Bertha (do.), Mrs. M. Hamilton (Nasmyth), Mr. Beck (Turner), Inventa (Hooper), Duke of Norfolk (Bell), Diadem (Fellowes), Dora (Turner), Mrs. Beck (do.), Euphemia (do.), Constance, Masterpiece (Hooper), Duke of Perth (Handasyde), Pompey (Hale), Sambo (do.), Rainbow (Hall), Queen of England (Fellowes), Elegant Thomson), Sir J. Franklin, Penelope, Premier, Ophelia (Fellowes), Rubens, Sir R. Peel, Zabdil (Thomson), Ibrahim Pacha, Addison (Turner), Thisbe, and Supreme. Class Showing.—For White Ground Flowers: 1, Mr. Turner, for Almanzor. Yellow Ground: 1, Mr. Turner, for Diadem (Fellowes). Yellow or Straw (selfs): 1, Mr. Lane, for Ophir. White: 1, Mr. Turner, for Swansdown. Dark: 1, Mr. Bragg, for Sambo. Mulberry: 1, Mr. Treacher, for a Seedling. The prize of 20s., given by M. Brown, Esq., for the best Seedling, was awarded to Mr. Turner, for "Chieftain," a yellow ground flower, with rich bronze red margin, fine eye, shape, and substance. There were some other seedlings possessing considerable merit; altogether the show was much better than we had expected, owing to the lateness of the season.

## Garden Memoranda.

Royal Nursery, Slough.—Since we last visited this nursery, Mr. Turner has put up a large well ventilated lean-to house, 50 feet long by 16 feet in width, for the growth of specimen Pelargoniums. The wood-work of this house is so exceedingly light, that it almost appears as if the rafters were made of iron. The glass used in it is the best double crown, which is reported to answer admirably. The plants were in the most robust health, and very dwarf. The Tulip bed has been lengthened 40 rows, making it now to consist of 180 rows of the leading kinds, including Bijou, Julio Romano, Salvator Rosa, Vivid, Polydorus, Thalia, Musidora, Hamlet, and Duchess of Sutherland, &c. Numbers of them have already opened, and they are large and clean. The majority of them appear to be in good strain; the height of the bloom will however be from the 12th to the 20th inst. Many of the varieties measure 2 feet 8 inches in height, and they will yet be higher; the foliage, too, is correspondingly strong—some leaves that we measured were 8 inches across. This has been effected by planting in pure yellow loam; no leaf-mould or manure has been used. Great pains have been taken to protect them from spring frosts and rough weather, particularly hail-storms. The bulbs were planted on the 8th of November, and they were not permitted to receive heavy rains before the following spring. Pansies, in pots, were in full bloom, having flowers large and fresh. Among them we remarked Commander-in-Chief, Mr. Beck, Duke of Norfolk, Supreme, Almanzor, Ophir, Dora, Euphemia, Rubens, Sambo, Duke of Perth, Constantine, Eustace, Bertha, Sir R. Peel; and several promising seedlings. These plants have been blooming five or six weeks past. They were placed in common boxes, whose lights are drawn off during the day, except in the case of very bad weather, and they have been provided with plenty of air at night; the plants stand within a few inches of the glass. The beds of Heartsease in the open ground were also becoming gay, particularly masses of Mr. Beck, Malvern, Aurora, Queen of England, Masterpiece, and Blue Perfection. We imagine that Pansies will soon occupy a prominent place in every spring flower garden; for we know of nothing in the shape of bedding-plants that would make a grander display during the early months of the year. They are in blossom at Slough from the middle of March until June. Instead of having bare beds, therefore, from October till May, gardeners should turn their attention to the best varieties for bedding, and propagate them largely during summer, to plant out rather thickly, as soon as the usual occupants are removed. Carnations and Picotees, numbering 1600 large pots, besides beds, exhibited the best of health, and a fine bloom may be anticipated. Auriculas were in full beauty. The best varieties were Cheetham's Lancashire Hero, Jubilee, Lovely Ann, Ashton's Prince of Wales, Ringleader, Conqueror of Europe, Page's Champion, Crucifix, Imperator, Favourite, True Briton, Col. Taylor, Freedom, and Sykes' Complete. Pinks, which are also extensively cultivated here, were just beginning to grow. A square conservatory, with a ridge and furrow roof, on Mr. Paxton's principle, was full of spring flowering plants, of the most showy kinds, such as Cinerarias, Pelargoniums, Kalmias, Hybrid Rhododendrons, Azaleas, Tropæolums, Ericas, Epacris, &c., and among them we remarked some prettily-spotted Mimuluses. Young Dahlias are raised here by the thousand. They are very strong and healthy, and in excellent condition for sending out. We trust that the instructions given in our last Number by Mr. Turner, will not be lost sight of by those who receive plants in small pots. A double row of Hollyhocks, 140 yards long, backed by a fine Holly hedge, 12 feet in height, has been planted in the east side of the nursery. These will make a handsome display in August. The grounds altogether were beautifully clean, the fine Yew and Holly hedges which the nursery contains neatly trimmed, and everything in the best of order. A Glycine, which covers the front of Mr. Turner's house and shop, promises to be one mass of bloom, and will add something to the grandeur of the display made by the Tulips, Tree Pæonies, and Pelargoniums about the 18th of the month, than which perhaps a better time could hardly be chosen for seeing this nursery in perfection.

The Crystal Palace.—On the announcement of the Executive Committee that space would be granted to nurserymen and florists for the display of plants in the transept of the building, several at once availed themselves of the offer. The following sketch from notes made during a late visit will give some idea of the groups exhibited. Entering from the south of the transept, the first group that occurs is from Messrs. Knight and Perry, King's-road, Chelsea. Immediately within the very beautiful iron gates are two examples of Araucaria excelsa in ornamental vases, and a little in advance, occupying a portion of the centre of the transept, is the group in question. It comprises a fine large Rhododendron arboreum, Cryptomeria japonica, the Cowrie Pine from New Zealand, two handsome pyramidal Bay trees, Croton pictum, Azaleas, &c. A rustic basket and some vases are introduced to give variety to the mass. Passing the magnificent crystal fountain we arrive at the five groups of Palms, from Messrs. Loddiges, of Hackney. From whatever point they are observed their exotic foliage gives an interesting feature to the view. A few yards in advance are two other fountains, in the neighbourhood of which are several exhibitions of plants belonging to different persons. Mr. Clark, of Streatham, contributes a fine Tropæolum tricolorum, with greenhouse Azaleas, Rhododendrons, Cape Heaths, Cytisus racemosus, &c., and a nice specimen of the charming Dielytra spectabilis. Mr. Ferguson, of Stowe, furnishes Heaths, Cinerarias, Pelargoniums, Kalmias, Deodars, Pinus excelsa, &c., besides a quantity of small plants and cut flowers filling an ornamental stand, composed mainly of Staffordshire tiles. From Mr. Bragg, of Slough, come Cinerarias, Azaleas, Mignonette, Pansies, and Pelargoniums. Several interesting plants, arranged on stages, are from Mr. Weeks, of the King's-road. He has also a neat model of his show-house, besides various specimens of garden vases and seats. Messrs Rendle, of Plymouth, are represented by a couple of stands of various plants, such as Rhododendrons, Azaleas, Pelargoniums, &c. Mr. Dennis, of the King's-road, has a group with a variety of cut flowers, the sale of which, it will be remembered, is sanctioned by the Executive Committee. Messrs. Bragg, Clark, Ferguson, and Dennis also exhibit for sale a quantity of bouquets. Besides the plants and cut flowers furnished by the two last-named exhibitors, they have combined to decorate the floor about one of the fountains in a gardenesque style. Blocks of rustic wood, various plants of the Pine tribe, and the double Furze, form a kind of back ground, in front and around which are some terrestrial Orchids, Anemones, Polyanthuses, and various dwarf plants in flower, the surface of the soil and pots being

covered with Moss. A slightly elevated stand, directly in front of the northern, or Queen's entrance some 15 feet in diameter, is occupied by hardy hybrid Rhododendrons, exhibited by Messrs. Standish and Noble, of Bagshot. Amongst them are many fine varieties. The centre of the group consists of a large plant of Cryptomeria japonica, and on the outsides are some specimens of Cupressus Goveniana and C. funebris. To the left of this, and filling a large corner, is a fine collection of greenhouse plants from Messrs. Lane and Son, of Great Berkhamstead, consisting of Azaleas in many varieties, Rhododendrons of various colours, as arboreum and some of its first hybrids; a yellow variety, and a fine plant of R. Gibsoni. About the front of this group is arranged a quantity of Cinerarias, in fine condition. On the opposite part of the building is a collection of Conifers from Messrs. Paul, of Cheshunt. Conspicuous in this group is a fine variety of Pinus excelsa, also P. Russelliana, a few Cinerarias, and some cut flowers, the latter interspersed amongst the plants. Further down the transept, near some Staffordshire vases, are one or two Wardian cases, filled with various kinds of Cacti, Ferns, and small Palms, and by the group of plants belonging to Messrs. Lane, is another collection of these miniature plant structures. We remarked in the Exhibition of articles in glass in the gallery, from Messrs. Cogan and Co., of Leicester-square, a pretty Fern temple, neatly filled with those interestingplants.

## Miscellaneous.

*The Two-rowed Aponogete (Aponogeton Distachyon).*—We reproduce this plant in the hope of presenting a better figure of it than has yet appeared, and of drawing attention to a hardy aquatic of which too little is known. Several years have now elapsed since it was reported that a handsome sweet scented water-plant from the Cape had been naturalised in the tanks of the Botanic Garden, Edinburgh. It was to the species before us that allusion was made, and it has since found its way here and there southward. It was introduced into Cornwall by Sir Charles Lemon, and there, as well as in Devonshire, it seems to have as completely established itself as if it were a native of the country. The correspondent, who first brought the Devonshire plant under our notice, expressed a doubt whether it was really the two-rowed Aponogete; its flowers being so much larger than they are represented in books. There is, however, no doubt about its name being correct; the differences that have been remarked being the mere result of exuberant luxuriance. The specimens came from an open pond at Woolston, the seat of the Rev. Charles Osmond, in the parish of Loddiswell, near Kingsbridge, S. Devon, where the plants thrive in a surprisingly luxuriant manner, producing thousands of delicious fragrant flowers throughout the summer, and even in January bearing 500 blossoms as fine as those represented. Innumerable seedling plants arise around their parents. To Mr. Osmond we are also indebted for the specimens, and for the following history of his acquisition of the plant: "About three years since a root was given me the size of a shot, which I planted in a small pan and sunk it in the pond; it grew rapidly, and, in a few months, produced flowers; and, unobserved by me, seed also, from which have sprung up to the surface of the water hundreds of plants. The spring which supplies the pond is peculiarly clear, always running, and, in the severest winter, rarely freezes." The species is common at the Cape, where it bears the name of Water Uintjies. Mr. Bunbury mentions it thus:—"The flowering tops of the Aponogeton distachyon, a pretty white-flowered floating plant, frequent in pools of water in various parts of the colony, are sometimes used both as a pickle and as a substitute for Asparagus." *Residence at the Cape*; p. 201. *Paxton's Flower Garden for May.*

## Calendar of Operations.

*(For the ensuing week.)*

### PLANT DEPARTMENT.

Azaleas should be attended to as they go out of bloom, potted if they require it, and placed in a favourable situation for forming their young growths. Many plants, particularly large ones, which received a liberal shift last year, will not have filled their pots so full of roots as to render repotting necessary, and it is better to allow such to make their growth, and set their flower buds, without additional pot room. This growth will, of course, be a moderate one, and when this is properly matured, and the danger of their starting again is past, we give them a slight shift, and place them in a cool house. In the new soil so supplied, they continue to produce roots during the remainder of the autumn and winter, but without making progress in the tops, and the roots being thus in advance of the head, the plants are prepared to meet the flowering season with extra vigour; for in the size and colour of the flowers, Azaleas so treated far surpass those which have been treated in the ordinary way. Though these useful plants succeed very well in common peat, to which a small portion of leaf-mould and sandy loam, with a liberal supply of sand, has been added, yet those who can procure Wimbledon peat, at a moderate expense, will find it answer their purpose to do so, as the high state of perfection to which the Azalea attains in that soil, is ample recompense. Supply abundance of drainage to large specimens, and let the compost be rough in proportion to the size of the plants to be shifted. Hard-wooded plants, recently potted, should be kept rather close till their new roots are in progress; and in fine afternoons they will be considerably benefited by a gentle syringing. During this season, when the greater part of the plants are in active growth, and require more warmth and moisture, those which are in flower should be kept by themselves, where their blossoms can be preserved by shading, free admission of air, and a drier atmosphere. As the cooler pits and frames are set at liberty, they may be made very useful during the summer by filling them with suitable composts, and turning out young greenhouse plants into them, there to make their summer's growth. Treated in this manner they make much greater progress during a season than when grown in pots, and are with less difficulty induced to form handsome plants. Young Azaleas, Camellias, &c., can by this treatment be induced to make double the growth, and thus acquire a vigour which will be maintained for years, and which is not so easily obtained under any other course of management. The principal points requiring attention are, to secure a good drainage, to give each plant sufficient space; and to elevate the surface of the soil as near to the glass as possible, allowing only sufficient height for the plants themselves, and a vigorous summer's growth. The extent to which this plan is adopted should be regulated by the facilities at command for preserving them after they are taken up in the autumn, and potted, as the frames will then be required for other purposes.

### FORCING DEPARTMENT.

Pineries.—The increasing power of the sun's rays will now tend to raise the temperature of the Pine pits considerably higher; but care should be taken not to allow it to get above 90°, as the leaves are very liable to be injured by excess of heat. If it cannot be kept down by a moderate increase of ventilation, recourse must be had to shading with thin bunting, which is preferable to opening the sashes too much, and thus causing excessive evaporation. Success in the cultivation of the Pine depends in a great measure upon the avoiding of sudden changes, which tend either to check their growth or to cause undue excitement, and the consequence of which would be to throw the plants prematurely into fruit, at the expense both of size and quality. Cherries.—Where the fruit is ripening give abundance of air, and maintain a drier atmosphere, but let the trees on which the fruit is swelling have plenty of water, and syringe them freely in fine weather, to keep the foliage and fruit free from insects. Strawberries should now be abundantly supplied with water, or they will change colour before they have attained their full size. Melons.—Keep up the heat in the beds by adding fresh linings as they require it. If plants, on which the fruit is near ripening, are in need of water, give it in the morning, that the vapour arising from the soil may pass off during the day. Keep the shoots thin and regular, allowing not more than three or four fruits to swell on each plant. As it is not necessary that Melons for preserving should be very large, those which are intended for this purpose may be left thicker on the plants than those which are grown for table; for, in the latter case, size is almost as much an object as flavour. Endeavour by all means to preserve the foliage of early plants in a clean and healthy state, that they may produce a second crop. Frames, in which Potatoes have been forced, should now be prepared for late Melons. Let the soil be good, 18 or 24 inches deep; and if the frames are not furnished with hot-water pipes, a bottom heat of 80° should be supplied by means of linings or fermenting material between the beds.

### FLOWER GARDEN AND SHRUBBERIES.

The newly planted beds in the flower garden will require watchful attention, lest any of the plants suffer from drought; and the watering should be done in the morning or rather early in the afternoon; for if done late, and there should happen to be a frost during the night, they would suffer. I would still recommend the use of evergreen prunings as a protection against scorching sun and cold cutting winds. The surface of the ground may be left very rough, to prevent evaporation, until the plants are sufficiently established to admit of the branches being removed; after which, if the ground be dry, it should receive a good watering, and then, for appearance sake, should be made smooth with a small rake; or, if this course be not approved of, it may be made smooth at once; and, to prevent the escape of moisture, it may be covered over with a thin layer of short Grass from the lawn, which the extending foliage will soon conceal. In either case the plants should be well watered immediately. After planting, taking care to moisten the bed thoroughly, as plants, turned out of pots, are liable to suffer much if not well attended to, until they make new roots into the soil. Many late spring propagated plants will be better if they remain a little longer in the frames, as unless fairly established previous to being planted out, they will be a long time before they start into growth, in a satisfactory manner. Where the young plants have been pricked out into frames of soil, attention should be paid to lifting them with a sufficient ball of earth and roots, and also to conveying them to their destination, and planting them as quickly and with as little injury as possible.

### FLORIST FLOWERS.

The side beds, and where breeder Tulips are grown, should be examined, and any promising buds covered, even if with a piece of board, having a hole through it, so that by introducing a Carnation or other stick, it may be kept the requisite height above the flower.—Dahlias in pots should be kept growing, so that robust healthy plants may be insured when the time comes for planting out. See that the manure is well incorporated in the soil where they are to be planted.—Ranunculuses are generally looking well; keep seedlings from too much sun, and quicken their growth by all available means. Shade Auriculas, and as the pips decay extract them from the calyx, so that the seed may have every possible chance of ripening. Stake Carnations and Picotees, and keep the surface of both Pink and Pansy beds loose and friable.

### KITCHEN GARDEN.

Beds should now be prepared for Vegetable Marrows and Ridge Cucumbers, by taking out a trench in one of the quarters, 4 feet wide and 15 inches deep, throwing the soil to the two sides to raise them higher. The trench should be filled to the top with rotten dung, from the surface of the earliest Vine borders, or from any other convenient source; this should be trodden solid, and covered to the depth of 16 inches with part of the soil taken out in forming the trench, mixed with some fresh soil and a little manure. This should be done immediately, that the bed may have time to settle, before the plants are put out. Let old Mushroom beds be examined, by removing the soil as soon as they go out of bearing. If the dung appears decayed or exhausted, the bed should be immediately renovated; but if, as it often happens, the beds are found in good order, solid, and teeming with spawn, they should be watered moderately with tepid water, if they require it, and covered in a day or two afterwards with 2 or 3 inches of fresh loamy soil. In hot weather, the house should be kept as cool as possible, and a moist atmosphere obtained by sprinkling the paths and walls with cold water; allowing excessive evaporation to escape by means of a top ventilator.

State of the Weather near London, for the week ending May 8, 1851, as observed at the Horticultural Garden, Chiswick.

| May. | Moon's Age. | Barometer. | | Temperature. Of the Air. | | | Of the Earth. | | Wind. | Rain. |

The highest temperature during the above period occurred on the 17th, 1833—therm. 85 deg.; and the lowest on the 15th, 1838—therm. 26 deg.

## Notices to Correspondents.

Back Numbers. Full price will be given for the following Numbers, *with the Newspapers*, or half price for the Newspaper alone: 1845—12, 34, 35; 1846—25, 41, 42, 50; 1848—32, 38, 49, 50; 1849—52.

Books: *C C.* "James's Gardening."‡

Chrysanthemums: *G L F.* We never recommend dealers.‡

Cucumbers: *A Correspondent.* The leaves are mildewed to a very great extent. Cut off the worst, and apply sulphur by means of some of those "sulphurators" which are found so admirably adapted for the purpose.‖—*J C.* A very handsome Black Spine, measuring 26 inches in length ‡

Gutta Percha: *Woglog.* We have no personal experience of pipes made of this substance; but we hear them well spoken of. We do not believe that rats would eat them, but we have no doubt they would gnaw through them, as they will through wood and lead. For stables, nothing is better than good Dutch lumps set on edge.

Heating: *A J B.* No stoves are suitable for greenhouses, unless the dryness they cause is counteracted by water evaporating in sufficient quantities to keep the air damp. If the last is secured, the kind of stove is unimportant.

Horticultural Society: *A Gardener.* All gardeners who present themselves at the garden before half-past 8 in the morning are admitted to see the exhibition and to remain till 10, at which hour the garden is cleared of spectators and others, in order that the final arrangements may be completed.

Insects: *A B.* 1, Eudorea mercurella; 2 and 6, Lophoderus ministranus; 5, Hadena plebeia; 3 and 4 rubbed to pieces by the Noctua, which was loose. *W.—Wissingham.* Your drawing, No. 3, evidently represents Pachygnathus villosus of Duges. We cannot determine No. 4 without seeing it. *W.—F. Kcr.** A male of Sirex Gigas. *W.*

Melons: *J H.* The Cassabar Melon is large, oblong, greenish yellow, tolerably good, but not equal to the Trentham Hybrid and others recently obtained. For a general crop you cannot do better than grow the Bromham Hall.‖

Names of Plants: *A B C D.* We answer all persons, if their inquiries relate to gardening; and you would have received a reply, if your letter had arrived. 1, Jasminum revolutum; 2, Polygala cordifolia; 3, Fritillaria pyrenaica.—*A.* Apparently Sparmannia africana, from the Cape of Good Hope.

Roses: *W C J.* We doubt whether the state of your Rose trees is attributable to mildew only; its effects have been probably aided and abetted by some constitutional defect in the bushes. Are you sure that the stocks agree with them, or that they are well manured? At all events, we would cut them "hard back," when they first began to swell their buds, for the purpose of strengthening them.

Vines: *A B.* Luxuriant growth and a damp atmosphere have caused the small green excrescences, which have alarmed you, to appear on your Vine leaves. They will do no harm.‡

### SEEDLING FLOWERS.

Pansies: *R P.* Promising. Can you let us see it again.*

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS,

AS THE

ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by Dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9l. 10s. per ton, or 9l. 5s. in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.

40, Bridge-street, Blackfriars, London.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per on, in dock. Sulphate of Ammonia, &c.

NEW TURNIP MANURE, 50s. a Ton.—Mr. POTTER can strongly recommend the above as a cheap and efficient Manure, and capable of raising heavy crops. Delivered free on rail. The Bags to be returned or paid for.

POTTER'S GUANO, 7l. per ton; SUPERPHOSPHATE OF LIME, 6l. per ton; GYPSUM, 25s. per ton, including bags and delivery on rail.—28, Clapham-road-place, London.

GUANO AND OTHER MANURES.—Peruvian Guano of the finest quality; Superphosphate of Lime; Gypsum; Salt; Nitrate of Soda; Moffat's Patent Concentrated City Sewage Manure, and all others of known value.—Apply to MARK FOTHERGILL, 204, Upper Thames-street, London.

MR. J. C. NESBIT, F.C.S., F.G.S., Consulting and Analytical Chemist, Laboratories, 38, Kennington-lane, London.—PRIVATE INSTRUCTIONS in Chemical Analysis, and the most approved methods of making ARTIFICIAL MANURES. Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

HOSE FOR LIQUID MANURE, Fire-engine, and agricultural purposes, made of canvass, lined and coated with gutta purcha; it is about one-third the price of leather or india-rubber, will convey liquids of all kinds under a heavy pressure, it is extensively used at the Government public works; also by the navy, and amongst agriculturists, giving universal satisfaction. Testimonials and prices may be obtained of Messrs. Burgess and Key, 103, Newgate-street, sole manufacturers.—London Agents: Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.—Country Agents: Messrs. Ransome and Parsons, Ipswich; Messrs. J. and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. S. Wilson, Agent for Scotland.

TAN, (Gratis) fresh from the pits.—Apply to ESSEX and SONS, 28, Stanhope-street, Clare Market, London, in the immediate neighbourhood of Covent Garden.

TO AGRICULTURISTS.

THE SUBSCRIBERS, in returning their sincere thanks to their numerous Customers for the liberal patronage which they have so long enjoyed, beg earnestly to solicit the attention of Agriculturists and their friends in England to their improved Light GRUBBER, combining both cheapness and efficiency. The Implement was strongly recommended by the East of Berwickshire Farmers' Club, at their meeting in December last; and the numerous parties who have since honoured us with their orders have expressed their high satisfaction with it as a most efficient Implement. The price, with travelling wheel, complete, is only 65s., delivered free to any station on the North British Line.

As the Turnip season is now approaching, the Subscribers take this opportunity of calling attention to their improved Turnip-sowing Machines, which they feel confident will give entire satisfaction to those who may favour them with their commands. The price is Six Guineas, and every attention will be given to the speedy execution of orders by

SCOULAR AND CO.,

Haddington, N.B. Agricultural Implement Makers.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

LINGHAM BROTHERS, 170, Hampton-street, Birmingham, sole Manufacturers of the improved WOOD and ZINC MENOGRAPH, or Label for Garden Borders, Flowerpots, &c., in boxes of 100, &c. The Zinc Labels are highly approved of for their lasting durability; can be written upon with the greatest ease, and, when dry, a permanent inscription is secured. Directions for use sent with each box, including bottle of Metallic Ink.

Sole Agents in London, G. and J. DEANS, Horticultural Implement Warehouse, 46, King William-street, London Bridge.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

THE ANNUAL COUNTRY MEETING of 1851 will be held, by the gracious permission of Her Majesty and Prince Albert, in the HOME PARK, WINDSOR, in the week commencing MONDAY, the 14th of JULY.

Copies of the Prize Sheet, containing the terms, conditions, and amount of the respective Prizes, and the Rules of Exhibition, and also copies of the requisite printed Forms of Certificate, may be obtained on application to the Secretary, 12, Hanover-square, London. All Certificates must be returned, filled up, to the Secretary, on or before the **17th of May**, the Council having decided that in no case whatever shall any Certificate be received after that date.

In the application for Certificates, the Character and Age of the Animals to be exhibited should be stated, in order that the proper Forms of Certificate may be sent.

By order of the Council, JAMES HUDSON, Secretary.

12, Hanover-square, London, May 10.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

THE MAY GENERAL MEETING of the Society will be held at the Society's House, in Hanover-square, on THURSDAY, the 22d May, at Twelve o'clock.

By order of the Council, JAMES HUDSON, Secretary.

London, May 7th, 1851.

*** Professor WAY'S LECTURE, "On the Agricultural Employment of Common Salt," will be delivered before the Members in the Council Room of the Society on Thursday next, the 14th inst., at Twelve o'clock.

# The Agricultural Gazette.

*SATURDAY, MAY* 10, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

| | | |
|---|---|---|
| WEDNESDAY, May | 14 | Agricultural Society of England. |
| THURSDAY, — | 15 | Agricultural Imp. Soc. of Ireland. |
| WEDNESDAY, — | 21 | Agricultural Society of England. |
| THURSDAY, — | 22 | Agricultural Imp. Soc. of Ireland. |

WE have yet to add a few words on AGRICULTURAL EDUCATION. Its object, we have shown, must be to convey to the student all the truth which bears upon his future profession; and, by practice, to confer upon him the skill that it requires. Now, what are the means at present in existence for giving this education? There is a Professorship of Agriculture in the University of Edinburgh, which has long been ably filled by Mr. LOW, who, by his writings and his lectures, has done perhaps more than any other living man to spread a knowledge of the rules of good practical farming. There is a lectureship on agriculture in connection with the University of Aberdeen. There are many private schools throughout the country which profess to teach the rudiments of sciences connected with the art of cultivation, and among them it is only fair to mention one in the neighbourhood of London conducted by Mr. NESBIT, a gentleman widely known to agriculturists by his lectures and performances in connection with the chemistry of agriculture. There are many schools in Ireland under the superintendance of Dr. KIRKPATRICK, agricultural inspector under the commissioners of national education. There are many farmers, here and there, in every county, who take pupils and profess to teach the methods of successful practice. And there is the Royal Agricultural College at Cirencester.

These are the means—what is the use that is made of them? Of the many thousand farmers annually entering on the first year of their business, how many have attended the lectures of Professor LOW—the agricultural schools in Herts, or Suffolk, Middlesex, or Hampshire? How many even have been for a year or two under the guidance of some successful farmer—how many have been students at Cirencester College? The agricultural education of the present day is received *at home*. It is no doubt often good, and the student or apprentice often does it credit; but we imagine that whether it be for the acquisition of extensive and general knowledge of one's business, or for the acquisition of *business habits*, a thing of highest moment—a *home* education will find few defenders.

Our own opinion is that a lad coming from a school such as that of Mr. NESBIT, where his mind has been directed to some of the facts and sciences of agriculture, subsequently living and *working* for two or three years on a farm cultivated, as in Berwickshire for instance, for the breeding and fattening of live stock, as well as for the growth of corn; and finishing off with attendance on the lectures of Professors Low and GREGORY in Edinburgh College, is as likely to prove an intelligent and successful farmer, as any other plan would make him. This would be an expensive mode of education, but in cases where the pupil is made useful on the farm it would be efficient. Its efficiency is however generally more dependant on the will of the young man himself than on that of the farmer with whom he is situated: and though it may be made, and often has been made most successful, yet there are, no doubt, many instances of failure.

The next best plan of education, and a less expensive one, is offered by those institutions which teach the art of farming, and show its progress in operation, to a number of pupils together. The only institution of the kind in this country exists at Cirencester. It has hitherto been less successful than it ought, owing no doubt to some extent to the fact that the students have not been fitted, generally, by previous education, to receive the instruction that it offered. This defect has been so obvious, that since last Christmas the council of the College have altered their plan of operation. They have added a school for boys to their establishment. Previously to that time they had refused to admit students under 16 years of age, and even those were not admitted unless they passed such an examination as showed them to be qualified to attend the various lectures with advantage. *Now*, the College is open to students of any age. Instruction, general as well as agricultural, is offered. If the student be qualified, and anxious to gain as much instruction as possible in a short time, he is able, under the new system, to attend a full course of lectures on every subject, in the course of a twelvemonth; seeing all the processes of the agricultural year, meanwhile, performed upon the farm around him. If from defective education, or from mere youth, the student be not yet prepared in those branches of knowledge needed to enable him to profit by the scientific lectures, he is no longer refused admission on this account; but ample means are provided for remedying his deficiencies. And if a parent determining on agriculture as his son's profession should wish to give him an education fitting him not only for success in that profession, but for the society of intelligent and well educated men through life, he is now offered exactly what he wants at the Royal Agricultural College. It will, indeed, be a most extraordinary thing if, with an abler staff of officers than ever yet combined their efforts to render agricultural instruction efficient—with the means at its command of teaching and illustrating the sciences and the rules of farming more fully than any single institution ever yet has done—this college should fail of attracting the confidence of the agricultural body. It seems to us at present most fully to deserve their confidence. We hope that its future career may show that it possesses it.

We must add a few words upon the agricultural schools of Ireland. A report, by Dr. KIRKPATRICK, is published in the volume on "National Education in Ireland for 1849," from which we learn that at Glasnevin, near Dublin; Loughash, county Tyrone; Markethill, county Armagh; Dunmanway, county Cork; Rahan, King's county; Belvoir, county Clare; and in other places, there are institutions which, assisted by the Commissioners of National Education, receive agricultural boarders and pupils, teaching them by practice and instruction the details of management on a small farm, along with the usual elements of an ordinary literary education. They are chiefly sons of small farmers. Those who have attained greatest proficiency are admitted into the Glasnevin establishment near Dublin, from which, after a year or two of further instruction, they go to situations as farm managers, or they undertake the cultivation of land on their own account. These schools and model farms are rapidly supplying Ireland with a body of instructors who will doubtless prove, as Dr. KIRKPATRICK anticipates, "one of the most efficient amongst the many agencies now at work for the correction of that sadly defective mode of culture hitherto so prevalent in Ireland, and which has tended so much not only to retard the social progress, but even to peril the very existence of large masses of her population."

There seems no want of pupils in the sister island at her agricultural schools; there seems interest enough taken there in the subject of agricultural education. It will indeed be a shame upon the agriculturists of England if the single institution established among themselves for the education of the rising generation of farmers should be inadequately supported.

## REPORT ON THE AGRICULTURAL SECTION OF THE GREAT INDUSTRIAL EXPOSITION OF THE NINETEENTH CENTURY.

No. I.—In entering upon a description of the more interesting objects in the Great Exhibition, arranged in Class 9, "Agricultural and Horticultural Machines and Implements," and Division A. "Implements for Tillage" the first that we notice are the ploughs.

The PLOUGH has passed through many transformations since the days of our Saxon ancestors, when it was ordained that "no one should guide a plough who could not make one;" and must be a very different instrument now from what it was when the legislature were obliged to pass an "act agaynst plowing by the taile." And there is but little more diversity between our ancient and modern ploughs, than between those at present used by various nations. By visiting the Great Exhibition, a person may go from the nearly perfect instruments of our best makers, to the more rude and clumsy of some other countries; and may thus walk, as it were, a century or more back into time, and see things existing

examine the iron beam, head, soles, share, mould-board and handles of an improved English plough, with frame that cannot pant or quiver, which raises and turns the furrow gradually, and which besides having long handles to give the holder a more complete and accurate control over its movements, possesses beautiful, yet simple mechanism, for adjusting coulter, draught, &c., to the American plough of wooden frame with iron share and breast so formed as apparently to root or grub up the soil rather than regularly turn it, with short beam, handles so short as to give but little leverage power over the implement, and it may be with no coulter to cut the slice clean from the unploughed land; to the Belgian plough with but one short upright handle, like that which our forefathers discarded directly the power of double handles was discovered; or to the far more primitive and barbarous wedge, with handle and beam wherewith the Egyptians stir the rich loam of their Nile. And among the "improved iron" ploughs also there is a great difference of form and dimension, according to the varied soils and uses for which they are adapted, and to the fancy of makers or the fashion of particular districts. Some ploughs, especially the Scotch, are almost twice the length of others; there are mould-boards, concave and convex, of steep incline or long sweep, shares of all shapes, and numberless adaptations of the different parts of the frame to the points and lines of pressure and resistance, with a view of securing the greatest strength and steadiness with the least weight and complexity. We cannot give the reader an idea of the forms and proportions of the working parts without drawings and cuts, so that our descriptions will be only of such peculiarities as at once struck our notice in viewing the implements, and may be easily understood; and indeed the merits of a plough depend not upon the "good sweep" of its mould-board, or the apparent rigidity of its parts, but are shown, like those of a road-horse, less by its points than its performances. The eye of the most practised maker can hardly pronounce which of two good ploughs will do its work in the best manner; and for many ploughs even a day's competition is not a sufficient trial, their peculiar property being, perhaps, that of retaining their excellence of form and framing unshaken for a great length of time. Experience only will gradually extend and establish the use of the best ploughs; and our recommendations here will be limited, therefore, to ingenious appliances which are obviously calculated to facilitate the operation for which the implement is intended. The order in which we mention the ploughs of different makers will be very irregular.—The iron ploughs of William Busby, of Newton-le-Willows, Bedale, Yorkshire, are worthy of attention. The mould-turner has a great and gradual sweep, the measure of one plough from the point of the share to the hindermost edge of the mould-board being no less than about 5 feet; and the share can be made to dip more or less, and set more or less "to land," by screwing in different directions the end of the lever upon which it is fixed; this, we believe, was an invention of the Messrs. Ransome. While the leverage power and command over the instrument afforded by long handles are retained in these ploughs, the exactness of the whole operation is not left, as in the swing ploughs, to the hand of the workman upon these long lever handles, and to the traces and backbands of the team; but regularity of depth and width are in a great measure insured by a couple of wheels, one in the preceding furrow, and one upon the unploughed land. The sword coulter is pressed against one side of the flat iron beam by a square link enclosing both, and nipped tight with a screw, the link passing behind the coulter shank below, and before it above the beam,—thus preventing it from altering its slanting posture by moving backward. This fastening, however, does not allow of that universality of movement and position which ploughmen find to be necessary when setting their coulters. Near these is an iron plough by D. Harkes, of Mere, near Knutsford, the coulter of which is set in a mortice-hole, more or less "land" being given by two side screws, and the blade set further forward or otherwise by another screw in front of the coulter shank and above the beam. As many attempts have been made to obviate the use of wooden wedges for this purpose, we shall mention the various contrivances of this kind to be found in the Exhibition. There are also many forms of the plough cock; those being perhaps the most objectionable in which the height or direction of the draught are altered, not by simply hanging a link between different teeth of a rack, or by dropping a bolt through different holes, but by taking a feather or key out of the end of a bolt, withdrawing the bolt, putting it through a fresh hole, and again inserting the feather. Among the iron ploughs of John Wilkie, from near Glasgow, we observed one with a friction wheel. Several attempts have been made to lessen, in this way, the friction of the sliding sole: this wheel is at the heel of the plough; it is in an inclined position, so that while touching the ground close to the unploughed land, or just where the sole would have been, it reaches upward between the "holes" or handles, and can thus be of considerable size. The rim is levelled so as to roll flat upon the ground; but we should fear that the wear of the axle will soon cause it to work untrue, and that the dirt will clog and damage it. There is a turn-wrest plough by the same maker, in which two mould-boards with shares are carried upon opposite brackets on *then*—just as astronomers look through their tubes and lenses, and behold objects in the very act, as we may say, of existing some thousands of years ago. He may a spindle, which lies along above the beam. By turning this with a lever, one turner and share is taken up, and that on the other side let down for work. The plough head carries a chisel point, which serves for each share without being moved. The end of the spindle has a small eccentric stud, or block, which shifts the top of the coulter, so as to have its point always more landward than the share. The requisite alteration of the line of draught from one side of the beam to the other is managed by a long horizontal link on the plough cock: the draught chain to which the whipple-trees are attached slips from end to end, as the horses are turning, and is held there by the curved form of the link. More or less land can be given by means of a semi-circular rack, setting the link in a direction more or less inclined to the line of the beam. The arrangement of the two shares and breasts in this plough appear to be more cumbersome and not so neat as in some others.—The iron ploughs, by Allcock, of Radcliff, near Nottingham, have a pretty good contrivance for setting the coulter. The shank, which being round, allows the cutting-edge to be placed at any angle with the line of draught or progression, is held tight by a staple with screw, nut, &c., between two pairs of studs on an iron disc, the staple-bolt passing sideways through the beam. The disc in turned by an arm and screw so as to set the coulter-point backward or forward, and is inclined by a side screw, in order to give the blade more or less land.—The patent turnwrest plough, of Lowcock, of Thorverston, is perhaps the best of any for the intended purpose. The form is well known: it is like two ploughs set heel to heel, with both of the shares and mould-boards lying the same way, and condensed into a small compass by the mould-boards being divided, and the hinder part of each united back to back in a swinging bracket which adjusts itself to whichever way the plough may be moving. When turning, all the ploughman has to do is to release the handles by pressing a spring and turn them over to the other end of the implement, the whippletrees with their link slipping along a rod from one end of the beam to the other as the horses are turning. There are two coulters, both having the advantage of remaining unmoved during the operation.—A plough by W. Abbot of Bideford, is one of the few in which cheap light iron has not superseded the less durable and more clumsy wood. The chief novelty is a small friction-wheel working vertically beneath the beam, and in the place usually occupied by the heel of the "sole" and "land-side;" a cutter or chisel of a triangular form is carried in front of this wheel, apparently to make a clear and even path for it, and this can be raised or lowered. A cleaner or scraper follows the wheel. A paper on the implement informs us that, "the principal benefit of this plough is, the great reduction of friction; by which, according to the opinion of judges, horse-labour is reduced one-third, as compared with that required for ordinary ploughs. It also lessens the expense of keeping in repair. The principle can be applied to any plough."—A variety of ploughs catch the eye of the visitor as he passes along the department, excellent in workmanship, but having no special peculiarity except that they are nearly all of wrought and cast-iron; the coulter fastenings consisting of either iron or wooden wedges, and of the different devices mentioned in this report. Some ploughs carry a square chisel point, instead of having a pointed share, being apparently adapted for stony land; some have high mould-boards of great length, on purpose for deep ploughing; and in some (as those from Essex), the concave form of mould-board is discarded, and instead of this is convex; the share, instead of having a triangular wing, resembles the circular knife of a small chaff-cutter; this kind of plough suiting the stubborn clay soil of some districts.—The patent ploughs of Howard, of Bedford, are well worth attention; they appear calculated to do their work in a perfect manner. They are double-wheeled ploughs, and the chief peculiarity is the long lever extending from the upright spindle affixed to these wheels to the handles, by means of which the beam is lifted or depressed. The dip of the share can be regulated by a lever held in its place by a toothed nut, screwed to a serrated segment. From the multiplicity of objects we have only room to say one or two words about those which we profess to describe; and as everybody will in turn witness the exhibition for themselves, our readers will doubtless pick out from our notices the contrivances which they deem worthy of a minute examination, and award to the remainder only a cursory view; these reports saving them a great deal of unnecessary time and search. We shall thus furnish them with a guide to the agricultural portion of the Industrial Show, as well as a permanent record of the inventions there contained.—G. Dray and Sons, of Uddington, near Glasgow, exhibit a one-way, turn-over, or turnwrest plough, consisting of two shares, with mould-boards fixed by brackets from opposite sides of a spindle above the beam. The plough carries a fixed chisel-point, above which each share rests when in work, the other share and breast not in work being carried in the air higher than the beam. The difficulty of altering the position of the coulter with accuracy has here been obviated by permanently fixing an upright blade upon each share; but the absolute immovability of a coulter is, we apprehend, a worse fault than its looseness. Lowcock's plough is the only good one in this respect, as the coulters may be set just as the workman finds needful, and are left undisturbed at each end of the field.—The registered turnwrest, by Comins, of South Molton, Devon, is ingenious. There is one share turning over on a spindle; two mould-boards are fixed as on a ridge-plough, and a pinion upon the same axis pushes one of these breasts out while drawing the other in. A lever and connecting rod turn the spindle by a crank, the lever at the same time shifting the top of the coulter, so as to move its point to the required place. Another lever or rod is attached for turning a double skim-coulter at the fore end of the beam. The shape of this plough must necessarily be imperfect, since the mould-turner is but ill adapted for a "land-side," which should be straight. Great defects seem inseparable from this class of ploughs, but our preference is decidedly given to that having both shares, mould-boards, and coulters fastened upon the main frame, as in an ordinary plough—giving thus the greatest stability with the least mechanism to be clogged or deranged.—John Smith, of Uxbridge, exhibits Warren's Patent Ploughs, one peculiarity of which seems to dwell in the broad soles upon which they rest, the flat thin plates, 7 or 8 inches in breadth, filling up most of the furrow bottom. This may give greater steadiness, and equalise the wear by diffusing the friction over a large surface.—The ploughs of E. H. Bentall, Maldon, Essex, have the circular knife share and convex mould-turner of that county, with beam and handles of wood. In one, the iron lever upon which the share is fixed is not shifted by a screw inside the plough, but is curved and brought up to one side of the beam where the set-screw can be easily reached.—R. J. and R. Laycock, of Newcastle-on-Tyne, have a plough, in which the flat shank of the coulter is set in a mortice by five screws. A link passes from the sides of the beam behind the mortice over the top and front oft he coulter; and a screw at its end, by pressing the top backward, moves forward the point of the coulter; two screws beside each other on one side of the beam, hold the coulter edge at any angle with the land to be cut; and two more on the other side, and placed one above the other, give the blade more or less land. This is rather complicated; it seems desirable in contrivances for this purpose to avoid as much as possible a multiplicity of small screws, as the threads quickly wear away when constantly used in the dusty operations of the field.—About midway down the court occupied by implements, the great makers, Garrett and Crosskill, Barrett, and Ransome, have erected galleries or stands, these being situated opposite each other along the main avenue, and decorated with colours and lettering, according to the taste of the builders; that of the name last mentioned is a plain drab, and while wanting the gaudy ornament seen on some of the others, and failing to match them in some descriptions of machinery, is equal to any, we suppose, in its display of ploughs of almost every sort. As the patent case-hardened cast-iron shares of Ransomes and May, their ploughs of wood and iron applicable to all soils and purposes, and the excellence of form and superior workmanship of their implements, have been long known to all agriculturists, we need not stay to point out the good qualities which may be found here. We may say in a word, that long experience has proved the mould-turners, and several parts of these ploughs, to have been constructed upon sound principles; no one dare find fault with the general make and finish of the different parts, and most of the better appliances for adjustment to be found elsewhere are also employed here. Among the minor improvements, we may mention that some of the ploughs have a plate or band a few inches broad attached to the upper edge of the mould-board, and sloping inwards at about right angles with the mould-board so as to prevent loose moulds from pouring over into the furrow.—We must not forget to name the improved ploughs of W. Pearce, Poole, Dorset. The beam consists of two wrought-iron bands, the space between which is filled up by a solid cast-iron arch tapering off at its extremities. Ransomes and May have patented a beam in which firmness and lightness appear to reach a maximum; two iron bands being set out to some distance apart by spells or spindles. But a form of beam like a double bow is awkward for the workman's eye; a straight, narrow beam, on the other hand, like Pearce's, is much easier for drawing ridges and for ploughing straight generally. With this advantage of neatness, this beam is solid, compact, and cannot shiver, and is very little heavier than Ransome's. The improvement which Ransome's effected by substituting cast-iron for wrought-iron shares, has been applied by this maker to the coulter. The shank and blade are in separate pieces; and when the case-hardened cast-iron blade wears out, another is screwed on. This is calculated to diminish still further the blacksmith's bill for laying, &c. The price of the improved plough is extremely low; it was one of the one-wheeled ploughs tried at Pusey, and did its work remarkably well. One of Pearce's ploughs is furnished with about the best attempt at a friction wheel that we have seen. It is a small solid wheel, like the "traveller" of a horse threshing-machine, running close to the unploughed land, having an axle only on one side. Its periphery drops a trifle lower than the plough sole so as to take the weight; and instead of a great portion of the "land-side" being absent, only just enough is cut away to admit a part of the wheel into the plough-heel. The wheel runs flush with the land-side; and as it has no spokes, the dirt cannot get in to impede it. The short axle works in a box, which also covers up the inside face of the wheel, and there is a scraper on the top of the wheel. The whole contrivance is as simple as possible, and the bearing remarkably sheltered from dirt; altogether appearing well calculated for saving horse labour, without impairing the efficiency of the implement. *I. A. C.*

## ON THE ACTION OF THE FINER PARTICLES OF EARTHY MATTER ON VEGETATION.

[Translated from the German of the late Professor Schübler, of the University of Tübingen.]

(*Continued from p.* 283.)

III. Lime (or pure quicklime).—This earth frequently enters into mixture with vegetable juices; it is found, next to silica, most frequently in the ashes of plants, and consequently particular families and species of plants, and even the same plants according to their different periods of development, exhibit remarkable differences. The ash of several species of trees is very rich in carbonate of lime; the ash also of many leguminous seeds is rich in this earth, while, on the contrary, the stalks of many of the Cerealia, so abundant in silica, contain only a small proportion of lime. Plants of the same kind commonly contain less lime in their early growth, but a larger proportion in their advanced stages. Many aquatic plants, several of the Myriophylla, Characeæ, and different Algæ, during their process of vegetation, deposit lime, even in crystalline grains, upon their inner or outer surfaces, although the water in which these plants develope themselves contains only a very little carbonate of lime, which is not deposited on other organic bodies. In the botanical periodical "Flora," I have communicated some more exact observations on the Hydrurus crystallophorus, an indigenous aquatic plant found in Würtemberg. It appears from all these circumstances to be highly probable, that on the perfect cultivation of various plants, lime acts favourably as a virtual means of nourishment; and on the contrary, to be injurious to others: accordingly we observe that Chrysanthemum segetum, Erica vulgaris, and various species of Carex, become more rare when clay lands are improved by lime and marl. Mixed with soil, lime has the property of preventing the formation of the free acids, which in wet clay lands easily result from the decomposition of organic matter or other process of oxidation. It renders acids already present in the soil innoxious, provided they are not in too great an amount. Particles of humus, in an almost insoluble state, have become through its agency soluble, and converted into a beneficial means of nourishment for plants. Heavy clay soils by its means are rendered lighter, lose their too great tenacity, and acquire the property of drying up more easily.

IV. Magnesia.—Various opinions have been formed of the action of magnesia on vegetation. Experiments tried in many districts have shown that magnesia, in combination with carbonic acid, as well as in its union with silica, by no means exerts an unfavourable influence; on the contrary, that it sometimes occurs in the most fertile soils.—Einhof gives an example of a marl containing 20 per cent. of carbonate of magnesia; Sprengel, another instance of a marl, which contained even 28 per cent. of this earth: while both these marls were employed with as good an effect as others in which magnesia was not present. The slaty marls of the keuper formation in Würtemberg, which are frequently employed in vine-cultivation, and often also as an under-dressing for corn crops, almost always containing carbonate of magnesia, the proportion of which sometimes amounts to 30 per cent. Berthier found magnesia in union with silica in the fertile soils around Lille; Burger gives an instance of very fertile soils formed in Carinthia by the disintergration of serpentine and chlorite; Davy also, in his "Agricultural Chemistry," remarks, that the most fertile districts of Cornwall abound in soils containing mild magnesia. It appears, from these results of experience, to be established, that this earth in combination with carbonic acid, or in union with silica, is entirely uninjurious to vegetation; it even further appears to act beneficially on some plants as a means of nourishment, as is the case, according to Sprengel, in the culture of Flax, in the ashes of which plant especially, there is a large portion of magnesia. The ashes of several other plants also contain not unfrequently a certain amount of this earth; its presence however does not appear to be absolutely necessary to any of them, since it occurs in the ashes of the perfectly developed plants, in greater and smaller quantities, or is even absent altogether, according to the composition of the soils in which they have been respectively grown, as has been particularly noticed by Berthier in the ashes of the Oak. In its caustic state magnesia is decidedly injurious to vegetation. Tennant first observed this effect in England, in the case of a marl which contained from 20 to 21 per cent. of lime, and from 29 to 31 per cent. of magnesia, (in union with carbonic acid). He endeavoured to explain its action by the circumstances of the small affinity of magnesia for carbonic acid, and the longer time the magnesia consequently required to become saturated with that acid, than is the case with quicklime; its presence thus, he thought, preventing the lime from becoming so quickly saturated with carbonic acid as in its simple state, without the magnesia, would have been the case. Experiments of my own on this point have likewise confirmed the injurious effect of caustic magnesia. Corn, Peas, and garden-crops, which I sowed partly in calcined magnesia previously moistened with water for 24 hours and exposed to the air; and partly in earth merely mixed with calcined magnesia, either germinated not at all, or with a developed germen which soon became sickly, and the young plants soon died away; while other seeds of the same plants sown at the same time in pure siliceous sand, carbonate of magnesia chrysolite, and other light insoluble powders, were, by similar treatment, under the same external circumstances, well developed. The injurious action of magnesia appeared to me in these experiments to depend especially on a physical cause; I always remarked that the substances which came into contact with it acquired the character of hydraulic mortar; the earthy particles became hardened, even while in a thoroughly wet state (as another series of experiments with this earth had previously shown me); in consequence of which, the germ and young plants could no longer develope themselves freely in the soil; even with a small admixture of calcined magnesia, was this the case. The solubility which magnesia, in its calcined state, possesses to a certain extent, and the weak alkaline properties it consequently exerts, may likewise contribute to this injurious effect. Sprengel endeavoured to explain the injurious qualities of magnesia on vegetation, by the great solubility which this earth exhibits, in combination with humic acid, as humate of magnesia, and the too great amount of nourishment which plants on that account absorbed, becoming injured in such case, as in every other, in which the supply of rich pabulum is superabundant. This may, under certain circumstances, be the case; but from my own experiments, in which neither humus nor humic acid came into play, calcined magnesia alone, and of itself, clearly acted injuriously on young plants. We cannot understand either, on this principle of explanation, why carbonate of magnesia, in fertile soils containing humus, should not also frequently have a similar injurious effect, since, in this case, humate of magnesia must likewise be often formed. An experiment, too, of Davy, is unfavourable to the explanation of Sprengel. He remarks, that a soil containing much organic matter, had a larger proportion of caustic magnesia in its composition than another soil, in which such was not the case; that peat, for instance, is an active and appropriate corrective for soils that have previously suffered from too great an application of magnesian limestone, in order to again improve them, and even to convert them into very fertile land.

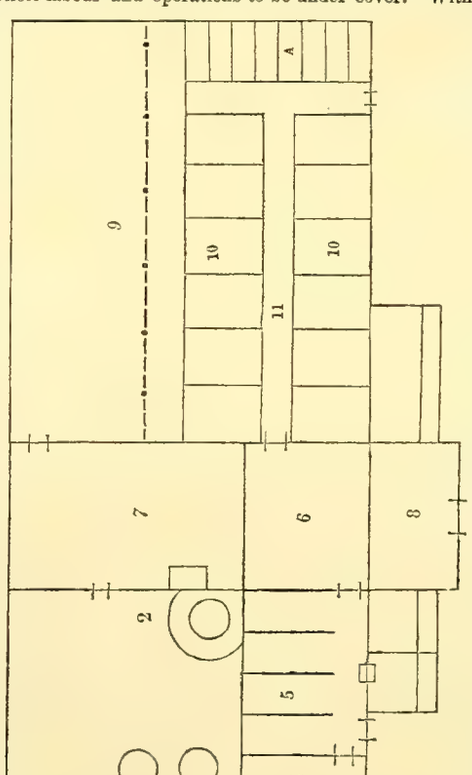
Magnesian Limestone (or Dolomite).—"The most considerable fact made known with regard to limestone, within the few last years, is owing to Mr. Tennant. It had long been known that a particular species of limestone, found in different parts of the north of England, when applied in its burnt and slacked state to land in considerable quantities, occasioned sterility, or considerably injured the crops for many years. Mr. Tennant, in 1800, by a chemical examination of this species of limestone, ascertained that it differed from common limestones by containing magnesian earth; and by several experiments he proved that this earth was prejudicial to vegetation, when applied in large quantities in its caustic state. Under common circumstances the lime from the magnesian limestone is, however, used in moderate quantities upon fertile soils, in Leicestershire, Derbyshire, and Yorkshire, with good effect; and it may be applied in greater quantities to soils containing very large proportions of vegetable matter. Magnesia, when combined with carbonic acid gas, seems not to be prejudicial to vegetation, and in soils rich in manure it is speedily supplied with this principle from the decomposition of the manure."—*Sir H. Davy's Introd. Lecture.* "The subject of the application of the magnesian limestone is one of great interest. It had been long known to farmers in the neighbourhood of Doncaster, that lime made from a certain limestone applied to the land, often injured the crops considerably. Mr. Tennant, in making a series of experiments upon this peculiar calcareous substance, found that it contained magnesia; and on mixing some calcined magnesia with soil, in which he sowed different seeds, he found that they either died or vegetated in a very imperfect manner, and the plants were never healthy. And with great justice and ingenuity he referred the bad effects of the peculiar limestone to the magnesian earth it contains. In making some enquiries concerning this subject, I found that there were cases in which this magnesian limestone was used with good effect. Amongst some specimens of limestone which Lord Somerville put into my hands, two marked as peculiarly good proved to be magnesian limestones. And lime made from the Breedon limestone is used in Leicestershire, where it is called 'hot lime;' and I have been informed by farmers in the neighbourhood of the quarry, that they employ it advantageously in small quantities, seldom more than 25 or 30 bushels to the acre. And that they find it may be used with good effect in larger quantities upon rich land. A minute chemical consideration of this question will lead to its solution. Magnesia has a much weaker attraction for carbonic acid than lime, and will remain in the state of caustic, or calcined, magnesia for many months, though exposed to the air. And as long as any caustic lime remains, the magnesia cannot be combined with carbonic acid, for lime instantly attracts carbonic acid from magnesia. When a magnesian limestone is burnt, the magnesia is deprived of carbonic acid much sooner than the lime; and if there is not much vegetable or animal matter in the soil to supply by its decomposition carbonic acid, the magnesia will remain for a long while in the caustic state; and in this state acts as a poison to certain vegetables. And that more magnesian lime may be used upon rich soils seems to be owing to the circumstance, that the decomposition of the manure in them supplies carbonic acid. And magnesia in its mild state (that is, fully combined with carbonic acid) seems to be always an useful constituent of soils. I have thrown carbonate of magnesia (procured by boiling the solution of magnesia in super-carbonate of potash) upon Grass and upon growing Wheat and Barley, so as to render the surface white, but the vegetation was not injured in the slightest degree. And one of the most fertile parts of Cornwall, the Lizard, is a district in which the soil contains mild magnesian earth. The Lizard Downs bear a short and green Grass, which feeds sheep producing excellent mutton; and the cultivated parts are among the best corn-lands in the county. That the theory which I have ventured to give of the operation of magnesian lime is not unfounded, is shown by an experiment I made expressly for the purpose of determining the true nature of the operation of this substance. I took four portions of the same soil; with one I mixed one-twentieth of its weight of caustic magnesia, with another I mixed the same quantity of magnesia and a proportion of a fat decomposing peat equal to one-fourth of the weight of the soil: one portion of soil remained in its natural state, and another was mixed with peat without magnesia. The mixtures were made in December, 1806; and in April, 1807, Barley was sown in all of them. It grew very well in the pure soil, but better in the soil containing the magnesia and peat, and nearly as well in the soil containing peat alone; but in the soil containing the magnesia alone, it rose very feeble, and looked yellow and sickly. I repeated this experiment in the summer of 1810, with similar results, and I found that the magnesia in the soil mixed with peat became strongly effervescent, whilst the portion in the unmixed soil gave carbonic acid in much smaller quantities. In the one case, the magnesia had assisted in the formation of a manure, and had become mild; in the other case, it had acted as a poison. It is obvious, from what has been said, that lime from the magnesian limestone may be applied in large quantities to peats; and that where lands have been injured by the application of too large a quantity of magnesian lime, peat will be a proper and efficient remedy. I mentioned that magnesian limestones effervesced little when plunged into an acid. A simple test of magnesia in a limestone is this circumstance, and its rendering dilute nitric acid, or aquafortis, milky. From the analysis of Mr. Tennant, it appears that the magnesian limestones contain from 20.3 to 22.5 of magnesia, from 29.5 to 31.7 of lime, 47.2 of carbonic acid, and 0.8 of clay and oxide of iron (per cent.). Magnesian limestones are usually coloured brown or pale yellow. They are found in Somersetshire, Leicestershire, Derbyshire, Shropshire, Durham, and Yorkshire, 'I have never met with any in other counties in England; but they abound in many parts of Ireland, particularly near Belfast."—*Sir H. Davy's Seventh Lecture.*

Oxides of Iron.—The peroxide of iron, like other matter insoluble in water, appears frequently to remain as an inert and indifferent ingredient of soil in reference to vegetation, when no strong acids exist in the soil, by which it may be dissolved; a circumstance, indeed, that very seldom occurs. In some experiments which I made on a small scale, plants developed themselves well in rich soils mixed with peroxide of iron, so long as the soil possessed the other physical properties favourable to vegetation. There are even soils on a large scale which not unfrequently are abundantly fraught with this oxide, particularly in countries lying on the keuper and lias-sandstone formations, like many in South Germany, which belong to the most fertile districts for orchards, vineyards, corn-fields, and the growth of almost every kind of fruit. We might, accordingly, be even tempted to ascribe to peroxide of iron, individually, a particularly beneficial agency, which, however, it does not appear to possess, at least not for many of the cultivated plants. There are no less fertile tracts of land on the white Jura limestone, in districts of which the soils contain only inconsiderable traces of that oxide; although, at the same time, it is not to be doubted that soils rich in the peroxide of iron appear to be particularly favourable to certain plants, as, for instance, to the Cinchona ferruginea in the Brazils. The protoxide of iron, on the other hand, appears to be of less value than the peroxide for vegetation, as it more easily forms salts of iron injurious to plants; and also, from its imperfectly oxidised state, is more likely to abstract oxygen from the surrounding soil, and from the roots of plants ramifying themselves throughout it. The marls, which contain much protoxide of iron, often become on this account only beneficial in their action after they have been exposed to the atmosphere for some time previous to their application. Chaptal adduces some observations on lands which, in consequence of the ploughing up of the black protoxide of iron, remained sterile for some years, but which afterwards attained a high degree of fertility on the saturation of the soil with oxygen; a result that in one case was accompanied with a change of colour in the soil from a dingy brown to a deep yellow. The beneficial effect of turf-burning in the cultivation of peat lands appears also, at least in part, to rest on the same cause; as the protoxide of iron, which not unfrequently occurs in such land, is by this operation more speedily converted into the peroxide. The well-known fact, that the Hortensia speciosa, so frequently cultivated as an ornamental plant, developes blue flowers, instead of its ordinary red ones, when it is planted in soils which are rich in protoxide of iron and fine carbonaceous particles, or which contain the latter only, indicates, in a particular manner, that such imperfectly oxidised bodies may even exert deoxidising effects on the plants grown in them. These artificially blue-flowered Hortensias become as ordinarily red when their petals are only touched lightly with a weak acid, a clear proof that this blue colour had not been occasioned solely by absorbed particles of charcoal or protoxide of iron, as had been already assumed. We should, moreover, greatly err in regarding soils which contain protoxide of iron as being generally injurious to vegetation. I found various plants develope themselves well in soils to which I had added several per-centages of pure protoxide of iron. Soils of great extent, too, not unfrequently occur, containing that protoxide, without its being known to exert an injurious influence on vegetation. Such soils appear on the grounds already stated, only to be capable of assuming, under certain external circumstances, more easily than other soils, these properties which are injurious to vegetation.

Oxide of Manganese.—As this metallic oxide does not commonly occur in soils free, but combined with earths and peroxide of iron in an almost insoluble state, it appears frequently to remain as an indifferent and inert ingredient of soil; and I found by artificial mixture of it in large proportions with soil, to be uninjurious. Sprengel found in the Waldeck a marl containing 4 per cent. of oxide of manganese, which was applied with great advantage to the improvement of the Grass-lands. Its amount, moreover, is very various in the ashes of plants; and in the case of the same plant, even at its perfect development, it does not occur constantly in the same proportion. It would appear that it must be classed rather with the accidental ingredients of the soil than with those component parts of it which are essentially necessary for vegetation.

## Home Correspondence.

*Thatch "versus" permanent Shelter.*—When a large stock is kept through the winter, economy in the use of straw is requisite. The quantity required for thatching, first the hay-ricks and then the corn, is considerable; and this at a period at which the stock of straw usually runs short. Again, the annual expense of thatching a large number of ricks is great. Furthermore, several



are necessarily left exposed for more or less time to damage from rain, both while making and when finished, unless many hands are engaged in preparing the straw, and in thatching at a period at which they are wanted gathering in in the fields. I have seen, in various parts of the country, permanent sheds in use for storing hay from the field, mere roofs supported on high poles or timber braced together, but open on all sides. Are you or any of your readers aware of any practical objection to this mode of saving hay? Is there any good reason why similar sheds should not be constructed for housing corn? These might be placed on cast-iron standards, capped, to keep out vermin, as staddles now are. The advantages in catching weather, saving the cost and labour attending rick-cloths, the annual preparation and consumption of straw, economy of space (for at least twice the quantity would be protected in a given space as compared with the ordinary plan), are very obvious. The expense, where Larch is grown, would be little more than the laths and slate; and when it is considered this would last 40 years, when well put together, and the other expenses are of annual occurrence, it is conceived there can be no question about the economy of the permanent shed. There may, however, be serious objections which do not occur to me, but which some of your more experienced readers may suggest. It is a subject on which it may be useful to invite discussion. *C. L.*

*The present State of Irish Agriculture.* — Having reviewed the chief measures in operation for the relief of Irish husbandry, they all appear to labour for the furtherance and prosecution of the one common object—the rural instruction of the people. I have succinctly traced the cause of this ignorance, from which results the pauperism of the people—the stagnation of industry and the inertitude of the country's resources. If we admit national ignorance as the national barrier to national prosperity, we must grant education to be the primary means—the true foundation on which to raise the superstructure of that great reformation. We are a people blessed with natural facilities for making up a country's greatness; and we are a nation presenting that anomalous position of a people paralysed from want of knowledge, which is a want of power. We want an education to inspire confidence to begin, and energy to sustain the improvement of Ireland by her sons. The progress of education is slow; its unit of time is a generation; but slowness of progress is essential to permanence of truth. Happily education is not now-a-days confined to a particular class—the progress of all things has broken down the barrier which shut out the light of science and of truth from those of humble means. The schoolboy must have his industrial, his working hours as well as his school hours. The development of the intellect, the formation of character must be supported by the powerful adjuncts of useful inclinations. To combine agriculture with literary studies is evidently a step in the right direction. It is a plan that enhances the liberty of youth from the thraldom of traditional prejudices—of those prejudices so faithfully imparted from sire to son, which mock at reason, enslave truth, and restrict the freedom of honest inquiry. Teach, therefore, the principles of improved agriculture to the scholar in the schoolroom, and such knowledge will aid him in the field. *Libra, April 9.*

*Produce of Cows.*—Seeing, in your valuable paper, of the 29th ult., that "A Subscriber's" cows, are producing 6¼ lbs. of butter each weekly, I am induced to state that I have a cow, five years old, of the Sussex and Devonshire breed, that with a small quantity of hay, and about 6 gallons Mangold Wurzel daily, with the run of 1½ acre of meadow (a large portion of which, owing to the late rains, has been of little use) has for these five weeks produced 12 lbs. of butter of superior quality weekly. *R. Newman, Stedham Hall, near Midhurst, Sussex.*

*Conveyance of Liquid Manure.*—In a former communication I incidentally mentioned some of the advantages accruing from the employment of Crosskill's portable farm railway. Since then I have succeeded in turning it to good account as a means of conveying liquid manure upon the land in wet weather, without injury to the soil. Hitherto I have used the liquid manure cart for this purpose. I need not tell those who have used it, that it is a barbarous apparatus though I confess to its usage, however suspicious I might have been that it occasioned more injury to the land than the manure did good. Still I did use it, because I disliked the idea of waste. However, as soon as I obtained my portable railway, I resolved if possible to apply it to this purpose; I therefore purchased a large cask holding 260 gallons, and fitted it upon one of my railway trucks. From Burgess and Key, of Newgate-street, I bought some 2-inch gutta percha canvas hose, in lengths of 10 yards each, and also a gutta percha tap to fit into the cask. Having thus obtained the requisite apparatus to work with, we laid down the rails from the tank to the field over which we wished to spread the liquid manure, and commenced by watering on each side of the railway to the extent of one length of the hose; after this was finished we lengthened the hose another 10 yards, and thus we continued till the watering of the field was completed. For this work two men are required; and I find that they convey twice as much liquid manure upon the land in a day as I was accustomed to draw out with the cart and a man and two horses. I need scarcely add that the land was not kneaded at all, although the liquid was applied in the wettest of weather, and upon a very tenacious soil. The extreme distance to which the liquid manure was conveyed was about 400 yards. I think it due to the manufacturers who bring their genius and skill to the aid of the agriculturists in these transition times thus to acknowledge our indebtedness to them; and therefore I request the insertion of the above in your valuable Paper. *J. M. Paine, March 22.*

*The subject of Farm Buildings* is deservedly engrossing a considerable share of attention at the present time; and as without convenient buildings farming cannot be made profitable, I venture to give my ideas upon it, in the hope that some of your correspondents, better qualified than myself, may be led to the subject; and, improving on these rough notes, reduce them into a working and practical shape. Considerable disappointment was felt with regard to the plans in No. 25 of the Royal Agricultural Society's Journal, on the construction of farm buildings. Not so much with the arrangement, as at the enormous expense, for it is too costly to sink 1200*l.*, or 1500*l.*, in buildings upon a farm of 300 acres. The Society should have pointed the way, not merely to good, but in these depressed times, to economical buildings, and until it has done this, it cannot be said to have conferred an obligation on the country with respect to this subject. The objects to be kept in view in erecting a "farmery," are first of all adaptation—making each office precisely what the best systems of feeding and working require—and arranging the whole, that the processes may be, so to speak, consecutive. The depôt of food and litter should adjoin the stables, cattle-boxes, and piggeries. No carrying back—no doing and undoing of work—the whole labour and operations to be under cover. With a strict regard to these essentials, we must keep a strict eye on the expense. To give a better idea than I possibly could do by any verbal description, I subjoin a rough ground sketch of buildings for a small farm, say of 100 acres, embracing the advantages of extensibility and economy, both in first cost and of future working. I have not attempted to lay it down on any correct scale; leaving it to individual taste, or to others of greater experience, to fix the dimensions of the respective offices; of course, the barn must be roomy, so as to afford space for an ordinary sized stack of Wheat behind the machine, which should be so placed as to throw the straw into the straw-house, and the corn and chaff into separate chambers: a floor level with the top of the machine will serve for chaff-cutting, corn-crushing, and other operations of a like nature; the chaff may be delivered either into the straw-house or cook-shop. From the straw-house we have doorways and feeding paths leading through the stables, cattle-boxes, and stalls. The cook-shop and root-house to be a lean-to from the straw-barn, and the piggeries from the stables and boxes. If required, a straw-yard may be formed on the south of the boxes; the implement-shed will be near the horses, and the latter close to the hind's cottage; the poultry-house to be also near at hand, and the stack-yard one side of the barn. As I know you could not afford space for a lengthy dissertation, and as after all a plan is worth a volume of description, I subjoin it, and make my bow, with an intimation, that by working up old materials, I think the cost should not exceed 300*l.* *Columella, Stockton.*

*Description of Woodcut.*—1, Stack yard; 2, Horse Walk; 3, Implements; 4, Loose Box; 5, Stable for four horses; 6, Straw; 7, Barn; 8, Cookery and Root room; 9, Fold, or Straw-yard; 10, Cattle Boxes; 11, Feeding Path; A, Stalls for cows or feeding; B, Cottage; C, Road.

*The Lark.*—We cannot, as Mr. Kidd proposes in your Journal, allow the question of the English lark to remain open, for no bird is more destructive to, and more difficult to drive away from, young corn than the lark. I have often been moved to wrath by the very unmistakeable effects of their proceedings, in the young shoots of corn lying on the ground, as if their appearance had given the bird first notice of the existence of the grain. I have driven up flocks of skylarks, and have scolded my bird tenters for their negligence; but they always assure me they cannot keep off the larks; and I believe them, as I have frequently assisted them in their labours with a gun, which merely drives the birds to another remoter part of the field. I should say that no observant farmer could enter the lists on the side of Mr. Kidd; and however agreeable a songster the lark may be, there is no doubt, as Mr. Foreman observes, of the farmer having to pay dear for his whistle. I am ready to produce witnesses of the truth of what I assert. *P. A. Hurt, Etwall, Derbyshire.*

*The Guano Trade.*—The importance of the subject will, I trust, excuse me for again trespassing on your space in this question. Since my first letter, I have been favoured with information volunteered by parties in the trade, substantially confirming my statements; and from more special inquiries since made by me in Liverpool, I have obtained the following particulars, which may be relied on. The comparative prices of guano and average rates of freight, during the months of April and May, from the importers, were as follow:—

| For the three years | 1849, | 1850, and 1851. |
|---|---|---|
| Price of Peruvian Guano | 9*l.* | 9*l.* 5*s.* 9*l.* 5*s.* |
| Average Freights paid | 4*l.* | 3*l.* 15*s.* 3*l.* 7*s.* 6*d.* to 3*l.* 10*s.* |

Some of the large ships arriving this month may be as low as 3*l.* 5*s.*; and by the advices of last mail, vessels were being freighted at 55*s.* to 60*s.* per ton. There can be no doubt, therefore, that the importers for the Peruvian Government are making a clear additional profit, from the fall in freights; and that in the course of the season, as the lower freighted vessels arrive, they may sell their guano at 7*l.* 15*s.* with the same profit which satisfied them in 1849. It is very galling to the farmers, who have been such good customers to the Peruvian Government, to find themselves entirely deprived of the benefit of the present reduced rates of freight. *James Caird, Baldoon, May 7th.*

## Societies.

### ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Monthly Council was held at the Society's House, in Hanover-square, on Wednesday last, the 7th of May; His Grace the Duke of Richmond, K.G., President, in the chair. The following Members of Council and Governors were present:—Earl of Ducie, Earl of Chichester, Lord Berners, Lord Southampton, Lord Bridport, Lord Portman, Sir Thomas D. Acland, Bart., M.P., Sir M. W. Ridley, Bart., Sir Charles Lemon, Bart., M.P., Sir John V. B. Johnstone, Bart., M.P., Colonel Austen, Mr. Raymond Barker, Mr. Barnett, Mr. S. Bennett, Mr. Bramston, M.P., Mr. Brandreth, Mr. W. G. Cavendish, M.P., Colonel Challoner, Mr. Evelyn Denison, M.P., Mr. Druce, Mr. Foley, M.P., Mr. Garrett, Mr. Brandreth Gibbs, Mr. Grantham, Mr. Fisher Hobbs, Mr. Kinder, Mr. Jonas, Colonel Le Couteur, Mr. Milward, Mr. Pendarves, M.P., Prof. Sewell, Mr. Shaw (London), Mr. Shelley, Mr. Sillifant, Mr. Simpson, Mr. Slaney, M.P., Mr. Spencer Stanhope, Mr. Stansfield, M.P., Mr. C. Hampden Turner, Mr. Turner (Barton), Mr. Jonas Webb, and Mr. Wilson, of Stowlangloft.

Hepburn, George, Chesham, Buckinghamshire.
Gainthorpe, Henry, Norman-road, Rusholme, Manchester.
Denman, Arnold, South Malling, Lewes, Sussex.
Sterriker, John, Driffield, Yorkshire.
Southam, Henry, Uppingham, Rutlandshire.
Barrett, Stephen, Harewood, Leeds.
Taylor, Isaac, Castle-house, Flint.
Parker, Thomas James, Endcliff, Sheffield.
Elmhurst, Rev. E., Shawell Rectory, Lutterworth, Leicester.
Roberts, Frederick Rowland, Aberystwith, Cardiganshire.
Gardiner, Samuel Weare, Coombe Lodge, Reading.
French, Richard Day, St. John's, Bungay, Suffolk.
Faviell, Mark, jun., Syndale-hall, Pontefract, Yorkshire.

The names of 12 candidates for election at the next monthly Council were then read.

Finances.—Mr. Raymond Barker, Chairman of the Finance Committee, presented to the Council the Report on the Accounts of the Society, to end of the previous month; from which it appeared that the current cash-balance in the hands of the bankers was 1668*l.*, (including 850*l.* on account of Life-Compositions). The Chairman also laid on the table the quarterly statements of income and expenditure, funded property and liabilities. This Report was received and adopted.

Country Meeting of 1851. — Lord Portman laid before the Council a report from the General Windsor Committee, which was received and adopted.

Country Meeting of 1852. — The Council was favoured with the attendance of Deputations from the South-Eastern District, including Viscount Torrington,

Hon. Henry Fitzroy, M.P., Hon. Henry Brand, Sir Edward C. Dering, Bart., Sir Henry Shiffner, Bart., Mr. Deedes, M. P., Mr. Dodd, M.P., Mr. Law Hodges, M.P., Mr. Davey (chief constable of the borough of Lewes), Mr. Ellman of Glynde, Mr. Figg, Mr. Laing (chairman of the South-Eastern Railway Company), Mr. Mac-Gregor (chairman of the Brighton and South-Coast Railway), Mr. Mouckton (town-clerk of Maidstone), Mr. Alderman Randall, Mr. Scudamore, Mr. Tanner, Mr. Tootell (Mayor of Maidstone), and Mr. Alderman Whichcord. These gentlemen kindly furnished to the Council the fullest information connected with their respective localities, and the facilities of communication which each of them offered in reference to other localities of the district or to the metropolis; and received, through the President, the best thanks of the Council for the favour of their attendance on that occasion.

Mr. Raymond Barker, Mr. Fisher Hobbs, Mr. Brandreth Gibbs, and Mr. Milward, then presented to the Council the Report of their personal inspection of the localities offered in the towns of Lewes and Maidstone, and their respective vicinities, for the purposes of the Society, in reference to its Country Meeting to be held in 1852, in the south-eastern part of England. The report gave a detail of the position and amount of accommodation of each of the proposed sites, and concluded with the expression of an opinion, that either of the places in question fully met the requirements of the Society as a locality for its Country Meeting, and at both of them the members of the Inspection Committee received from the authorities every kind facility to promote the object of their inquiries.

The Council then proceeded to make a selection of the particular place at which the Country Meeting of 1852 should be held, when it was finally carried, on the motion of Mr. Brandreth, seconded by Mr. Shelley, that Lewes should be the place of such meeting. The Lewes Deputation, on again being invited into the Council room, were informed by the President of the decision to which the Council had then come, and informed of the condition under which it was made, namely, that the chief officer of the borough of Lewes should, by that day week, conclude with the Secretary of the Society the usual agreement for the ratification and fulfilment of the stipulated engagements.

Country Meeting of 1855.—The Council having already decided on the South Wales district for the country meeting of 1853, and the North-East Midland district for that of 1854, proceeded, on the motion of Lord Portman, to constitute Lancashire, Westmoreland, Cumberland, and the Isle of Man, as the district of the Country Meeting to be held in 1855.

Judges.—The following committee was appointed for the selection and recommendation to the Council, of judges for the Windsor meeting, namely, the Earl of Ducie, Mr. Barnett, Mr. Brandreth, Col. Challoner, Mr. Druce, Sir John V. B. Johnstone, Bart., M.P., Mr. Jonas, Mr. Milward, Mr. Shaw (London), Mr. Simpson, and Mr. Stokes.

Pavilion Dinner.—Mr. Raymond Barker having called the attention of the Council to the number of persons for which the Dining Pavilion in the Home Park, Windsor, should be constructed, it was carried, on the motion of Mr. Shaw, seconded by Mr. Bennett, that accommodation should be provided for a number not exceeding 2000.

Election of Members.—Mr. Fisher Hobbs having moved, and Sir M. W. Ridley seconded the motion, that, for the purpose of leaving the weekly meetings free for practical discussions, an alteration should be made in the bye-laws, by which the nomination and election of members should be confined (like other official business, as now arranged) to the monthly Councils. This motion was carried, with an amendment made by Lord Portman (who conceived that every facility should be afforded to those friends of agriculture who wished to join the Society, and promote its practical objects), that, while the election should be restricted to the monthly meetings of the Council, the proposition of candidates should take place at every meeting of the Council, whether weekly or monthly, as had hitherto been the rule of the Society.

Captain Pelham.—The President expressed his deep regret, on the loss sustained by the Society in the premature death of the Hon. Captain Pelham, and announced the vacancies which that loss occasioned in the Council, and in the list of stewards of implements.

The Council then decided on the arrangements connected with the ensuing general meeting of the Society on the 22d inst., at 12 o'clock; and adjourned to Wednesday next, when Professor Way would deliver a lecture before the members, on the agricultural employment of common salt.

## Calendar of Operations.

### MAY.

Lammermuir Sheep Farm.—The first week of the lambing commenced about the 15th of last month, under the most favourable circumstances, the ewes, being in good condition, had plenty of milk, and the lambs were healthy and vigorous. For several days the thermometer ranged from 45° to 52°; at the latter it was standing on the evening of the 25th—with a few peals of distant thunder. Next morning the ground was covered with two inches of snow, with a stormy north-east wind. Though the snow had melted during the day, the hills have presented the same appearance since—besides heavy hail-showers during the day. The night of the 28th was excessively boisterous, with a long-continued thick sleet, which is worse even than dry snow for young lambs. Fortunately the shepherds had the afternoon's warning, and had their charges laid into the most sheltered places, otherwise the loss must have been great. As it is, we fear, from what we have heard, that in some places it has been considerable. Our own loss was only 8, which, as nearly 1500 ewes had lambed, is much less than we anticipated. The half of these also did not perish from sheer cold, but were drowned in sheep-drains, which have been, and still are, much flooded. We are glad to say that appearances would now indicate more favourable weather. Upon the whole, our loss, from the usual casualties of the lambing season, have been light, and hitherto we have had a sufficiency of twins to supply the blanks. Twins, in such situations as this, are not desirable, further than to meet such demands—indeed, the supply very rarely exceeds the demand—as they can scarcely be brought through without the assistance of seeds. If a ewe can make one good lamb, and keep herself in fair condition, on our lean pastures, she does very well, and will pay better than two inferior lambs from a ewe with a half—and frequently no—fleece, and so reduced as to be unfit to dispose of with the rest, if necessary, or unable to stand the privations of the coming winter, if kept on. Another week will see the bulk of the lambing over, after which the unlambed ewes will be taken out from the rest and examined; those that are barren being marked and returned to the hill, and such as are in lamb kept by themselves, until all lambed. The reason for this is, that as a large proportion of casualties take place at the end of the season, when the ewes begin to improve in condition, they are thus now under the eye of the shepherd, instead of being scattered up and down over several hundred acres. The earliest lambs will be castrated about the middle, and the youngest about the end of May. We are in the habit of burning our initial letter on the horns of the blackfaces; this was done to the ewe hogs about three weeks ago, at the time their jackets were removed, the horn not being sufficiently grown in autumn for this operation. The sowing of Oats was only completed last week, being much too late; but as Barley does not succeed here, and the last of the Turnips to be eaten by sheep on the ground were only finished a few days previously, there was no help for it. We only wait for favourable weather to sow the Grass seeds. We expected to have had the Potatoes planted this week; this also must be postponed, from the wet state of the ground. Meanwhile the horses are carting out manure for Turnips, and getting foreward with some odd jobs, that there may be as little distraction as possible from the main work of this month—the preparation of the ground for, and the sowing of Turnips. The cattle are still in the byres. We have sufficient Swedes in store to last them a fortnight, after which they will be turned out to Grass. *A Lammermuir Farmer. May* 1.

### METEOROLOGICAL REPORT.—April—May.

(*Continued from page* 285.)

| Date. | Time. | Max. | Min. | Wind.—Weather. |
|---|---|---|---|---|
| Apr. 26 | 6.55 a.m. | 29.73 | ... | About 9 a.m. the wind shifted from NNW. to SW., and at noon to WNW., with a very heavy appearance in NW. horizon, and in the evening to NNW. |
| | 10.20 p.m. | ... | 29.61 | A brisk breeze all day, with occasional showers. |
| Sun. 27 | 7.50 a.m. | 29.56 | ... | Gentle breeze at N., but a very cold day. |
| * | 5.20 p.m. | ... | 29.47 | |
| | 10.30 p.m. | 29.48 | ... | |
| 28 | 7.45 a.m. | ... | 29.50 | N. a.m. Bright fine morning, gentle breeze. |
| | 10.20 a.m. | 29.51 | ... | |
| † | 2 p.m. | ... | 29.51 | At 2 p.m. wind shifted to SSW., veering to WSW. at sunset, blowing gently; thunder about 3 p.m. |
| | 9 p.m. | 29.54 | ... | |
| ‡ 29 | 7 a.m. | ... | 29.50 | At 7 a.m. W., veering at noon to WNW. and NW.; frequent showers during the day. |
| | 7.20 p.m. | 29.54 | ... | |
| § 30 | 7.10 a.m. | ... | 29.54 | WNW. all day; at sunset, NW. Brisk breeze, with frequent hail showers in the forenoon. |
| | 10.15 p.m. | 29.60 | ... | |
| May 1 | 10 a.m. | 29.66 | ... | SW. Heavy and frequent showers. |
| ¶ | 10 p.m. | ... | 29.54 | |
| 2 | 7 a.m. | ... | 29.58 | NNW. Brisk pleasant breeze, with occasional heavy clouds. |
| | 10.40 p.m. | 29.72 | ... | |
| ** 3 | 7.30 a.m. | 29.70 | ... | WNW. to NW. Heavy rain in night; fine sunny day. |
| | 4 p.m. | ... | 29.62 | |
| 4 | 7.50 a.m. | 29.62 | ... | N. Stiff breeze, and bright sunny day; at 2.50 very dark appearance in NW. horizon. |
| | 2.50 p.m | ... | 29.59 | |
| | 9.20 p.m. | 29.63 | ... | |

* A storm travelling from west to east, having its central track considerably to the northward.

† A storm travelling from south; and, on overtaking the preceding storm, curving to the eastward.

‡ A storm coming from westward, and passing away to eastward.

§ A storm coming also from westward, and passing away to eastward.

All these currents followed each other in very quick succession. As the season is approaching in which thunder-storms more peculiarly occur, it will be interesting to watch their effect upon the barometer.

¶ Those of her Majesty's subjects who were present at the inauguration of the Crystal Palace, will long remember what a beautiful day was vouchsafed to the wishes of those who had looked forward with so much anxiety to this interesting ceremony, and they would scarcely suppose that at so short a distance the weather was so unpropitious; but the preceding storm having passed away, London was on the confines of one which was slowly approaching from the westward and going away to the eastward; the central storm's-eye passed over Woolwich on the afternoon of the 2d and about sunset rain began, with the wind at N.

** This storm came from the westward, and passed away to north-east, its track lying a considerable distance to the NW.

Dorchester, May 9th. *F. P. B. M.*

(*To be continued.*)

## Notices to Correspondents.

Charcoal: *J L.* As much as will take up 300 or 400 gallons of urine would be a good dressing for an acre.

Cheese-room: *J M* says, "I have a cheese-room 18 feet by 16½ feet, and 9 feet in height, which I am desirous of having fitted up with a steaming apparatus. Can any of your readers inform me what sized boiler and condensing cistern, and what kind of pipes (material and bore), would be best adapted and cheapest for the purpose, so as to give the room about 75° of heat in winter; and whether should the cistern be placed in the room?"

Chicken Fatting: *Anna.* We advise you to buy Baily's "Dorking Fowl: Hints for its Management and Feeding for the Table." 1*s.* 6*d.* It would not be fair in us to transfer its contents to our "Notices to Correspondents."

Early Dutch Turnips: *A B.* We do not suppose that by themselves they will be a sufficient substitute for Grass with cake. Your sheep will not maintain their ground unless you give them cake or Beans as well.

Farms in the South: *Scotchman.* We cannot take it upon us publicly to invite visitors to the different localities worthy of inspection. But on giving your address, we will privately name two or three where you might apply for permission to inspect.

Gorse: *E G.* Your specimen is the common Whin, which is used in some places for fodder. Another sort is also used which is not so coarse and woody, but does not yield seed, and must therefore be grown from sets and layers.—*Cottage Farmer.* There is no botanical difference that we know between what they call French Gorse and the common Whin. The Ulex stricta, or Irish Whin, is a distinct species, of a more upright and compact growth, softer and more tender, and is more easily prepared for food. We do not know the "Champion" Potato.

Management of Manure: *A Farmer.* It has been frequently detailed in our columns. We will, however, again refer to this subject.

Peat Charcoal: *A B.* It is very suitable for Vine borders See page 132 of the current year's volume.‡

Scientific Knowledge: *Ignoramus.* "How much is necessary?" Enough to enable you thoroughly to see in your farm a geological museum, a nursery, a hospital, a botanical garden, a laboratory, not forgetting all the while that it is a field on which *capital has to be made profitable.* Enough to enable you to see in part the limited extent of your own knowledge—for that is generally a pretty good test of one's attainments. We heard the other day of one who fell most miserably before this test. A single course of lectures had already fully filled him; and he applied to a neighbouring landowner—himself the son of one!—for a vacant farm. "Why do you not take land of your father?" was naturally asked. "Why, Sir, my father would object to the scientific style of farming I should wish to adopt—in short, Sir, he is far from being acquainted with the *Hacids* and the *Halkalies* of the present day."—This conversation really occurred. Poor fellow! What good had "a little knowledge" done for him?

Sugar Beet: *Irishman.* We do not expect the yield of sugar will be found enough to reward the cultivation and the manufacture.

Yellow Clover: *W Jackson.* Medicago lupulina is a wild plant growing in waste ground. It is annual. It may occur in arable fields unsown. Sown in 1841 on land since cultivated, it would not be possible for many plants to survive, so as that having been sown with red Clover in 1844, one half of the plants should turn out Trefoil. The seed professing to be red Clover must have been mixed with the seed of the yellow Clover.

Yew: *W S.* Sheep will eat Yew when it is withered, and it is then *extremely poisonous. W. C. S.*

Yield of Drainage Water: *T W T, Cheshire.* We have to acknowledge, with thanks, the receipt of your reply to our question.

Erratum. I beg to rectify a mistake in the article from me on "Spade Husbandry," which appeared in your *Agricultural Gazette* of April 26th, where it is stated that 18 inches of the length described should occupy the *handle* of the instrument, which measure I intended to be applied to the *blade*, not the handle. *E. T.*

## Markets.

### COVENT GARDEN, May 10.

Hothouse Grapes are plentiful and cheap, and the same remark applies to Strawberries. Pine-apples are more abundant. Dessert Apples chiefly consist of American Newtown Pippins. Oranges and Lemons are plentiful. Nuts remain nearly the same as last week. Vegetables of all kinds are abundant and good. Large supplies of Asparagus, young Carrots, French Beans, and Green Peas have been received during the week from France, Cucumbers from Holland, and considerable quantities of Potatoes and Asparagus from Cornwall, as well as some good Gooseberries; the latter fetch 2*s.* per pottle. New Potatoes may be obtained at from 4*d.* to 1*s.* per pound; old kinds realise better prices. Lettuces and other salading are sufficient for the demand. The best Mushrooms fetch 1*s.* 6*d.* per pottle. Cut flowers consist of Heaths, Pelargoniums, Camellias, Mignonette, Double Primroses, Stephanotis floribunda, Cinerarias, Moss and Provins Roses.

| — Spanish, p. doz., 1*s* 6*d* to 4*s* | Corn Salad, p. hf. sieve, 1*s* to 1*s* 6*d* |
| Leeks, per doz., 9*d* to 1*s* | |
| Shallots, per lb., 6*d* to 1*s* | |

### HOPS.—Friday, May 9.

Messrs. Pattenden and Smith report that the demand for fine coloured Hops continues to increase, and prices to advance, particularly for new Sussex Hops, the quality of which is considered superior to many past years. The late ungenial weather has greatly retarded the progress of the coming crop, and the land being in a wet unkind state, the probability is the crop will not be a heavy one.

| | | | |
|---|---|---|---|

COAL MARKET.—FRIDAY, May 9.

Holywell, 13s. 6d.; Eden Main, 14s.; Tanfield Moor, 12s.; Wallsend Gosforth, 13s. 3d.; Wallsend Hetton, 15s. 3d.; Wallsend Stewarts, 15s. 3d.; Wallsend Tees, 15s.—Ships at market, 65.

POTATOES.—SOUTHWARK, May 5.

The Committee report that during the last week there have been several fresh arrivals coastwise, as well as a heavy supply by rail. Our trade continues heavy at the following quotations:—York Regents, per ton, 80s. to 100s.; Scotch do., 70s. to 90s.; ditto Cups, 65s. to 75s.; Cambridge Regents, 60s. to 80s.; French whites, 60s. to 70s.

SMITHFIELD, MONDAY, May 5.

The number of Beasts was larger, consequently trade was heavy, and it was difficult to maintain late quotations. Some inferior qualities remained unsold. The supply of Sheep, although larger, was not excessive; however, trade was dull, and prices had given way. Lambs and Calves were lower. From Holland and Germany there are 578 Beasts, 650 Sheep, 119 Calves, and 14 Pigs; from France, 30 Pigs; from Norfolk and Suffolk, 2700 Beasts; and from Scotland, 330.

| Per st. of 8 lbs. | s | d | s | d | Per st. of 8 lbs. | s | d | s | d |
|---|---|---|---|---|---|---|---|---|---|
| Best Scots, Here-fords, &c. | 3 | 6 to 3 | 8 | | Best Long-wools | 4 | 0 to 4 | 2 | |
| Best Short-horns | 3 | 4 — 3 | 6 | | Ditto Shorn | 3 | 4 — 3 | 8 | |
| 2d quality Beasts | 2 | 4 — 2 | 10 | | Ewes & 2d quality | 3 | 0 — 4 | 0 | |

| Ditto Shorn | 3 | 8 — 3 | 10 | | Lambs | 5 | 0 — 5 | 8 | |
| | | | | | Calves | 3 | 0 — 4 | 2 | |
| | | | | | Pigs | 2 | 8 — 3 | 6 | |

Beasts, 3976; Sheep and Lambs, 25,460; Calves, 283; Pigs, 360.

FRIDAY, May 9.

The number of Beasts considerably exceeds the demand, and prices generally are low, yet a few choice things still reach 3s. 6d. Sheep and Lambs are more plentiful; trade is very heavy, and they cannot all be sold, although there is a disposition to take even less than we quote. We have a very dull trade for Calves, at lower rates. From Germany and Holland we have 53 Beasts, 170 Sheep, and 191 Calves; from Spain, 250 Sheep; from Scotland, 120 Beasts; from Norfolk and Suffolk, 500; and 89 milch cows from the home counties.

| Best Scots, Here-fords, &c. | 3 | 4 to 3 | 6 | Best Long-wools | 3 | 8 to 4 | 0 |
|---|---|---|---|---|---|---|---|
| Best Short-horns | 3 | 0 — 3 | 2 | Ditto Shorn | 3 | 2 — 3 | 6 |

| | | | | Calves | 3 | 8 — 3 | 8 |
| | | | | Pigs | 2 | 4 — 3 | 4 |

Beasts, 903; Sheep and Lambs, 9210; Calves, 371; Pigs, 395.

MARK LANE.

MONDAY, MAY 5.—The supply of Wheat from Essex to this morning's market was small, that from Kent fair, which was taken off readily at prices about equal to this day week. The demand for foreign is limited, and but little progress could be made in sales; our quotations remain unaltered.—Barley meets a fair sale without any improvement in price.—Beans and Peas are scarce, and sell readily at former rates.—The arrival of Oats is large, but their value is fully maintained.

| PER IMPERIAL QUARTER. | s. | s. | | s. | s. |

FRIDAY, May 2.—The arrivals of Wheat and Oats from abroad are liberal, but of other grain and Flour, both English and foreign, small. The attendance at market this morning was thin, and the business done in Wheat limited, prices remaining nominally as last quoted.—For Barley, Beans, and Peas there is a good demand at fully late rates.—The Oat trade continues very firm.—The value of Flour remains unaltered, but there is rather more inquiry for best marks of foreign.

LIVERPOOL, TUESDAY, MAY 6.—The supplies of grain and Flour from Ireland and coastwise continue exceedingly small. There was a good attendance at our market this morning. Most descriptions of Wheat were in moderately fair request, at the prices of Friday, which were rather easier than those of this day week. Flour was moving freely into consumers' hands, at fully late prices. There was a better demand for Indian Corn than during the week, and the price was firmer. The best mealing Oats continue scarce, and advanced 1d. per bushel on last Tuesday's rates. Oatmeal also improved 9d. to 1s. per 240 lbs. Barley, Beans, and Peas quite supported late quotations.——FRIDAY, MAY 2.—The arrivals of grain and and Flour have been moderate. At this morning's market Wheat did not move freely, and late rates were barely obtainable. Flour in fair request. Good mealing Oats continue scarce. Oatmeal improved 3d. per load. Barley, Beans, and Peas brought very full prices.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND CO. beg to notice their mixtures of GRASS SEEDS for Laying Land down to Permanent Grass, are now ready for delivery. They have reduced the price to 30s. per acre, allowing 2 bushels 12 lbs. to the acre.

Mixed sorts for improving old Grass Land, 1s. 2d. per lb.

Fine sorts, for forming Lawns, 1s. 3d. per lb. Directions for sowing will accompany the Seeds.

GEORGE GIBBS and Co. will feel happy in sending general priced Catalogues of Agricultural and Garden Seeds, on application to 26, DOWN-STREET, Piccadilly, London.

GRASS AND OTHER SEEDS.

THOMAS GIBBS AND Co., the Seedsmen to the "Royal Agricultural Society of England," corner of Half Moon-street Piccadilly, beg to call the attention of their friends to the following Seeds:

Mixtures of selected Natural Grasses for laying down Land to permanent Meadows and Pastures, apportioned to suit the nature of the soil.

Mixtures for portions of Parks near Mansions.

Mixtures for Garden Lawns and Grass Plots.

Mixtures for renovating Old Pasture Land.

Italian and other Rye-grasses.

White Belgian and Red Altringham Carrots.

Gibbs' new very large Parsnip.

Orange Globe Mangold Wurzel.

Long Red and other kinds.

Drumhead and Thousand-headed Cabbages.

Swedes, Hybrids, and other Turnips.

Clovers, Kohl Rabi, French and English Furze.

Sainfoin, Rape, Tares, White Mustard, and all Agricultural and Kitchen Garden Seeds, &c.

Priced Lists are now ready, and will be forwarded free, on application, by post, or otherwise, to corner of Half Moon-street Piccadilly, London.

HARTLEY'S PATENT ROUGH PLATE-GLASS FOR CONSERVATORIES, &c.

See Article in the GARDENERS' CHRONICLE of Saturday, December 8, 1849.

"Continued experience leaves us no room to doubt that this is the best material yet produced, and that it will in time supersede glass of all other kinds for the greater part of Gardening purposes." . . . "As for the article substituted for Rough Plate . . . it is wholly unfit for any horticultural purpose." . . . "The best sample of it which we have yet seen was Manufactured by Messrs. HARTLEYS, AND SOLD BY MESSRS. JAMES PHILLIPS & CO., 116, BISHOPSGATE STREET."

Supplied Wholesale, Retail, and for Exportation; cut to order in panes of

MILK PANS, from 2s. to 6s. each; METAL HAND-FRAMES, Glass Tiles and Slates, Propagating and Bee Glasses from 2d. each; Grape Glasses; Cucumber Tubes, 1d. per inch; Peach Glasses, Wasp Traps, Pastry Slabs, Hyacinth Glasses and Dishes, Fish Globes, Plate and Window Glass, Lamp Shades. GLASS SHADES.—Estimates and List of Prices forwarded on application

TO THEIR WAREHOUSE, 116, BISHOPSGATE-STREET WITHOUT, LONDON.

GLASS.

TO ARCHITECTS, BUILDERS, CONTRACTORS, &c.

HARTLEY'S ROUGH PLATE GLASS, one-eighth of an inch thick, weighing 2 lbs. to the foot, for RIDGE AND FURROW ROOFS, GREENHOUSES, RAILWAY STATIONS, ENGINE SHEDS, MILLS, MARKET HALLS, and Public Buildings generally. Specimens to be seen at the Exhibition, in the extreme South-Eastern end of the building, adjoining the United States department.

It being universally admitted that Glass in Roofs of a permanent character should not be less than one-eighth of an inch thick, weighing 2 lbs. to the foot, whilst any greater thickness or weight is unnecessary, leading only to additional expense, Messrs. JAMES HARTLEY and Co. have directed their attention to the manufacture of a description of Rough Plate Glass that combines *size and strength* with *economy of cost*. The Patent Rough Plate, one-eighth of an inch thick, or 2 lbs. to the foot, is manufactured in sizes expressly for Ridge and Furrow Roofs, 62 by 18 inches, thus giving a span of 10 feet, at a price not exceeding, weight for weight, that of common Crown Glass.

Not being transparent, blinds are unnecessary; and, when used in Greenhouses, no scorching occurs. Its *non-transparency* and *strength* render it eminently suitable for the glazing of Conservatories and Roofs of all kinds; also Factories, Workshops, &c., for which purposes it is supplied in squares of all sizes from 8 by 6 inches upwards.

For further information apply to any respectable Glass Merchant in London or the country, or to the Manufacturers.

N.B. The Patent Rough Plate is also manufactured 3-16ths and ¼ inch thick, and can be supplied at a much lower cost than the common Rough Plate.

Messrs. JAMES HARTLEY and Co., Wear Glass Works, Sunderland.—May 10.

GLASS FOR PIT FRAMES, HOTHOUSES, &c. in Boxes of 100 feet, 8s. 6d. each.

| | | | | | |
|---|---|---|---|---|---|
| 4½ by 3 | 5 | by 2½ | 6 | by 2½ | 6 by 3½ inches. |
| 4½ by 3 | 5 | by 3 | 6 | by 3 | 6½ by 3 |
| 4½ by 3½ | 5½ | by 3 | 6½ | by 3 | 6½ by 3½ |

Larger Squares increase in price according to size. Every size kept ready packed in boxes, and may be had at a moment's notice.

Extra Crown, Sheet, and Patent Rough Plate Glass, cut to size for Conservatories, Greenhouses, &c.

Gardeners and others glazing on Mr. Paxton's plan can be supplied with Sash-bars of any length for the purpose.

PROPAGATING, CUCUMBERS, FERN, PEACH, and every description of Garden Glasses.

Bailiffs, Farmers, Dairymen, and others supplied with Lord Camoy's Milk Syphons, Milk Lactometers, Glass Milk Pans, Glass Tiles, Slates, &c., &c., for collections of which Messrs. COGAN and Co. were honoured with the Silver Medal of the Dublin Society, as also the Silver Medal of the Liverpool and Manchester Society held at Warrington in September last.

For Estimates, Prices, and further particulars, please address Messrs. COGAN and Co., 48, Leicester-square, London.

Glass Shades, Gas Glasses, White Lead, Colours, &c., as usual.

GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2d. to 3d. per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. 87, BISHOPSGATE-STREET, WITHOUT,

Same Side as Eastern Counties Railway.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

WARRANTED BEST MATERIALS AND WORKMANSHIP, AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, BREWERS' USE, &c.

PATENT VULCANISED INDIA RUBBER HOSE-PIPES AND FLEXIBLE GAS TUBING.

JAMES LYNE HANCOCK (sole Licensee and) Manufacturer, Goswell-road, London.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, for portable Gas Lamps, and all purposes where a perfectly sound Waterproof and Flexible Pipe is required. Hot Liquors or Acids do not injure them; they are, therefore, much used for Chemical purposes, as they require no oil or dressing when out of use; are particularly suitable for Fire Engines, and are found exceedingly useful in dwelling houses for conveying Hot or Cold Water to Baths, &c.

Testimonials and prices may be had on application to the Manufactory.

N.B. Vulcanised India Rubber Garden Hose, fitted up with Roses, Jets, and Branches complete, with union joints ready to attach to pumps or water cisterns.

All Orders or Letters addressed to J. L. HANCOCK, Goswell-mews, Goswell-road, London, will meet with immediate attention.

Waterproof Fishing Boots and Stockings, Portable India-Rubber Boats, Shower and Sponging Baths, Air Cushions and Beds, made all sizes to order.

THE METALLIC PAINT, produced by the Patent Alkali Company, has been extensively used for several years on farm-buildings, iron bridges, roofs and railings, shipping, &c., and it is admitted that it covers a greater surface and stands far better than any other pigment on wood, iron, Abethaw Lime, and Roman Cement. Fine Black, 25l. per ton, and Rich Purple-brown, 20l. per ton.—Offices of the Company, 1, New Broad-street, London.—JOHN A. WEST, Secretary.

BELFAST.

THE IMPROVED FLAX MACHINERY.—Persons wishing to erect Mills for preparing FLAX from the Straw can be supplied with the IMPROVED MACHINERY, recommended by the Royal Flax Society, on application to the Makers, M'ADAM, BROTHERS, and CO., Engineers, Soho Foundry, Belfast.—May, 1851.

LIGHT, CHEAP, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT, an inodorous felt for damp walls, sold in rolls 32 inches wide, 1d. per square foot; also dry Hair Felt, for preventing the radiation of heat and deadening sound, and Sheathing for ships' bottoms, on which the copper lies smooth. Samples, directions, and testimonials, sent by post.—CROGGON and Co., Dowgate-hill, London.

DURABLE OUT-DOOR PAINT.

Removed to No. 9, Great Winchester-street, Old Broad-street, Royal Exchange.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-poor Paint ever invented, for the preservation of every description of Wood, Iron, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON and SON, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange, London.

No Agents.—All orders are particularly requested to be sent direct.

## SALES BY AUCTION.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew-lane, on TUESDAY, May 13, and THURSDAY, May 15, a first-rate collection of Dahlias, Carnations, and Picotees, Pinks, Heartsease, Geraniums, and other Plants, in blo m, and a large Assortment of plants for bedding. May be viewed the morning of sale.—Catalogues had at the Mart; and of the Auctioneers, American Nursery, Leytonstone.

IN BANKRUPTCY.—Stock of Plants in Pots, Two light Spring Carts, Van, Furniture, &c.

MESSRS. DAVIS AND VIGERS are instructed by the Assignees of Robert Westmacott to sell by Auction, on the premises, Stuart's-grove Nursery, Brompton, on FRIDAY, May 16, at 12 for 1, the entire STOCK of Camellias, Cacti, Pelargoniums, Roses, Azaleas, and a choice collection of Bulbs, Exotics, and Stove plants; in all about 1000 dozen, lotted to suit private purchasers and the trade; also two carts, covered Market Van, Tools, &c., with the furniture of the usual description in the cottage. May be viewed one day prior and morning of sale: and catalogues had on the premises; and of the Auctioneers, 3, Frederick's-place, Old Jewry.

IN BANKRUPTCY.—To Nurserymen and Florists.—Beneficial Lease of Premises, with possession.

MESSRS. DAVIS AND VIGERS are instructed by the Assignees of Robert Westmacott, to sell by Auction, on the Premises, Stuart's-grove, Brompton, on FRIDAY, May 16, at 12 o'clock, the LEASE of those well-arranged NURSERY GROUNDS and BUILDINGS, most eligibly situate, and comprising a commanding shop, seven spacious succession houses, and seven long ranges of forcing pits, all recently erected, and well fitted with hot water apparatus, stabling for two horses, cart-house, potting shed, &c.; with three good dwelling-rooms, and loft over; also a neat Cottage Residence in the grounds. The whole held for 36 years, at the nominal rent of 63*l.* per annum.—May be viewed any time prior to the sale, and particulars, with conditions of sale, had of T. B. WHITFIELD, Esq., 3, Lincoln's-inn-Fields; PHILIP JACQUET, Esq., Solicitor, Clifford's-inn; and of the Auctioneers, 3, Frederick's-place, Old Jewry.

BEDFORDSHIRE.—Great Barford, near Bedford, Biggleswade, and Sandy, Valuable Freehold Estate, Tithe free and Land-tax redeemed, giving Votes for the County.

MR. EDWARD PALMER will Sell by Auction, by order of the Mortgagee, at the Golden Cross Inn, Great Barford, near Sandy, Bedfordshire, on TUESDAY next, May 13, at 1 o'clock, in 11 Lots of about three Acres each, an important FREEHOLD ESTATE, consisting of about 34 acres of land, all adjoining and delightfully situate on an eminence facing the south, at the entrance of the village of Great Barford from Bedford, near the Wesleyan Chapel, having an extensive frontage to the road, and commanding a beautiful prospect. The land is of excellent quality, and suitable for building cottages, with garden ground attached, the cultivation of which in this neighbourhood has been found so exceedingly profitable from the easy transit of vegetables by rail to the London markets. N.B. Two-thirds of the purchase money may remain on mortgage if required, or the whole if satisfactory security is given.—Particulars, with plan and conditions of sale, may be had of Mr. Benj. Chandler, jun., Solicitor, Sherborne, Dorset; Messrs. Poole and Gamlen, Solicitors, 3, Gray's-inn-square, London; Mr. W. Wallen, jun., Architect and Surveyor, 14, Basinghall-street, City, and Greenwich, Kent; at the Law Property Assurance and Trust Society's Offices, 30, Essex-street, Strand; at the Golden Cross Inn, Great Barford; Swan Inn, Bedford; White Swan, Biggleswade; and at the Auctioneer's Offices, 20, Change-alley, Cornhill.

TULIPS.

MESSRS. GLENNY AND CO. are instructed to Sell by Auction, on the premises, Hoxton Nursery, New North-road, London, on MONDAY, May 26, at 12 for 1, precisely, 100 Rows of choice TULIPS, being a portion of the superb collection of Mr. Tebbutt. Among others will be found Pandora, Musidora, Louis XVI., Camus des Craix, Fabius, Rose Brilliant, Duke of Devonshire, Violet Alexander, Violet Quarto, Milo, Jackson's Princess Royal, Duc de Bordeaux, &c. May be viewed any time prior to the Sale, and Catalogues had on the premises, at the White Swan, Abbey Mills, West Ham; Cock and Castle, Elizabeth-street, Hackney-road; Victory, Kingsland-road; City of Canton, East-India-road, Poplar; of the Auctioneers, 420, Strand; and at 84, Fleet-street.

TO GARDENERS AND OTHERS.

TO BE LET, and entered upon immediately, a capital WALLED GARDEN, nearly Two Acres in extent, with Cottage, Shop, and Four Hothouses, well stocked with Vines, several Pits, Fruit Trees, &c. The whole well supplied with water. It is situate close to the city of Bath, only a few minutes' walk from the Railway Station. Rent very moderate. Coming-in about 60*l.*—Apply to J. H. COTTEBELL, 6, Terrace-walk, Bath.

TO BE LET, a HOUSE, with Four Acres of LAND, on the Brighton Railway—Rent, 20*l.*; pleasantly situated, facing the clump of trees adjoining the Horley Station, one hour's distance from London-bridge. An excellent opening for a Market Gardener. The two best rooms, which have French casement windows, would let furnished during the season to pay the rent.—Enquire of the Station Clerk at Horley, who will point out the premises and give the Landlord's address.

FARM TO LET.

TO BE LET, upon Lease, a most desirable FARM, with covenants for payment for unexhausted improvements, to be entered upon at Michaelmas next, consisting of about 250 acres, one-third being Arable and the remainder in Grass, singularly well adapted for Dairy purposes, being in the immediate vicinity of a large and flourishing first class market town, where the Milk and Butter is sold, and within an hour, per Rail, from London. The Dwelling-house is respectable and commodious, and all the Out-buildings, including Manure Tank and Stalls for 50 head of Cattle, large Barns, &c., are in first-rate order, and adapted to the modern system of Farming, having been partly rebuilt only a few years. The Stock of Short-horned Cattle, modern implements, Crops, &c., to be taken at a valuation. Encouragement will be given to a spirited Agriculturist, with a capital of not less than 2200*l.*—For further particulars, address to D. N., Post-office, Reading, Berks.

TO BE LET, with immediate possession, a small NURSERY GROUND, with good Seed Shop, three Greenhouses, and small Cottage attached; the said Shop has good fittings, and is situated in the market town of Reading, near the station of the Reading and Reigate line, and not far from that of the Great Western.—For particulars, apply either to J. J. BLANDY, Esq., Solicitor, Reading; to H. H., Springfield Cottage, Barbeaston, Bath; or to W. R., 14, Allington-street, Pimlico, London.

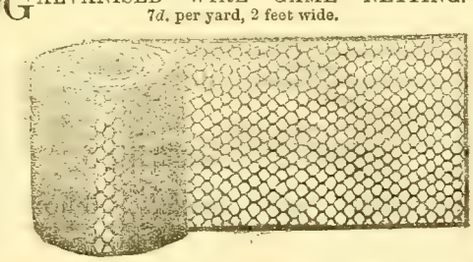
FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

CAPITAL FARM TO LET.

THE WATER EATON FARM, containing about 118 Acres of Arable and 196 acres of Meadow and Pasture Land, situate near Cricklade, in the county of Wilts, to be Let, on Lease, for a term of years, if desired, as from Lady-day last.

The owner will require to be satisfied as to the adequacy of the capital of his tenant.—Apply for further particulars and terms, to Messrs. LAWRENCE, Cirencester, Gloucestershire.



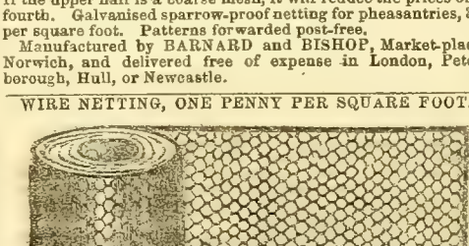
TO LANDOWNERS.—LAND DRAINAGE.

MR. BAILEY DENTON'S System of MODELLING ESTATES by a mechanical and cheap process, as shown in the Great Exhibition, No. 317, Class X., explained in a pamphlet, with plans, &c. Published by WEALE, 59, High Holborn. DENTON'S "A" LEVELS FOR WORKMEN are also shown on the same counter. None but such as are sold by JONES and Co., 39, Holborn, price 30*s.*, are made under the supervision of the Inventor.

DO YOU BRUISE YOUR OATS?

HORSE KEEP.—Oat Bruisers, Chaff Cutters, Ploughs, 42*s.*, Shares, 5*s.* per dozen; Rollers, Wheat Mills, Bean Mills, Steam Engines, Scarifiers, Turnip Cutters, Dressing Machines, Drills, Threshing Machines, Wood and Iron Harrows, Steaming Apparatus, Scotch Carts, Hay-making Machines, Horse Hay Rakes, and Drag Mills. First class goods warranted. MARY WEDLAKE and Co., 118, Fenchurch-street. Most liberal discount for cash. Goods delivered free. On receiving six postage-stamps a list, with 107 engravings, will be sent free.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.



| | Galvanised. | Japanned Iron. |
|---|---|---|
| 2-inch mesh, light, 24-inch wide ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch " strong " ... | 9 " | 6½ " |
| 2-inch " extra strong " ... | 12 " | 9 " |
| 1⅝-inch " light " ... | 8 " | 6 " |
| 1⅝-inch " strong " ... | 10 " | 8 " |
| 1⅝-inch " extra strong " ... | 14 " | 11 " |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

| | | | |
|---|---|---|---|
| 12 inches wide | 3*d.* per yard. | 30 inches wide | 7½*d.* per yard. |
| 18 " | 4½*d.* " | 36 " | 9*d.* " |
| 14 " | 6*d.* " | 48 " | 1*s.* " |

Galvanised do., 1*d.* per foot extra.

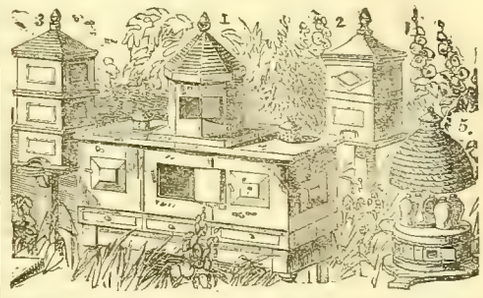
Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, ply-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each. Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

IRON GATES, HURDLES, WIRE WORK, &c.

THOMAS PERRY AND SONS, 252, OXFORD-STREET (NEAR HYDE-PARK), And Highfield Works, Bilston, MANUFACTURE all kinds of Park Entrance, Carriage and Field Gates, Wickets, Wrought and Cast Iron Gate Pillars, Plain and Ornamental Fencing, Palisading, and Balconies. Ox, Cattle, Sheep, and other Hurdles;

Tree Guards, Garden Seats, Garden Rollers, Wheelbarrows.

Hay Racks, Stable Fittings, &c. Iron Work of every description.



Wire Work in great variety, comprising Gothic and other Fencing, Flower Stands, Trainers, Arches, Pheasantries, &c.

The works being situated in the centre of the Staffordshire Iron district, THOMAS PERRY AND SONS are enabled to execute promptly orders to any extent with the greatest facility, of the best quality, and on the most moderate terms.

Manufacturers of every kind of Solid Iron and Tube BEDSTEADS, with all the recent improvements.

ALLSOPP'S EAST INDIA PALE AND OTHER BURTON ALES.—The Public is respectfully informed, that these favourite Ales may be had genuine, in casks of 18 gallons and upwards, at their respective stores, as under, where also a list of the bottles may be obtained.

The Brewery, Burton-on-Trent; Stores, 61, King-William-street, City, London; Cook-street, Liverpool; High-street, Birmingham. The Exchange, Manchester, 33, Virginia-street, Glasgow.

BEE HIVES, as shown at the GREAT EXHIBITION of 1851, by GEO. NEIGHBOUR and SON, 127, High Holborn, London. No. 1, Nutt's Collateral Hive; 2, Improved Single Box-Hive; 3, Taylor's Amateur Bar-Hive; 5, NEIGHBOUR'S Improved Cottage Hive, working three or five Glasses; the Ladies Observatory Hive, &c. &c.

A priced Catalogue, with drawings and particulars, forwarded on receipt of two postage stamps.

AGENTS.—Liverpool: Wm. Drury, Castle-street. Manchester: Hall and Wilson, 50, King-street. Glasgow: Austin and M'Aslin, 168, Trongate.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

ZOOLOGICAL GARDENS, REGENT'S PARK.—An ELEPHANT CALF and its Mother have been added to the Collection, and are EXHIBITED DAILY, together with the HIPPOPOTAMUS presented by his Highness the Viceroy of Egypt. The Band of the First Life Guards will perform, by permission of Colonel Hall, at 4 o'clock, on Saturday, May 10, and on every succeeding Saturday, until further notice. Admission, 1*s.*; on Mondays, 6*d.*

THE GREAT EXHIBITION.—HINTS TO VISITORS.—Among the tens of thousands who will grace the Industrial Fair, every nation will contribute bright samples of its youth, beauty, and fashion. The frequenters of the Ball, the Public Assembly, and the Promenade, will find both personal comfort and attraction promoted by the use of ROWLAND and SONS' valuable aids; and what better mark of esteem can be offered to friends on their return home, as a momento of the Great Exhibition, than a packet of

"ROWLAND'S UNIQUE DISCOVERIES."

ROWLAND'S MACASSAR OIL,

For the growth, and for preserving, improving, and beautifying the Human Hair.

ROWLAND'S KALYDOR,

For improving and beautifying the Skin and Complexion, eradicating all Cutaneous Eruptions, Sunburn, Freckles, and Discolorations, and for rendering the Skin soft, clear, and fair.

ROWLAND'S ODONDO,

Or PEARL DENTIFRICE, for preserving and beautifying the Teeth, strengthening the Gums, and for rendering the Breath sweet and pure. Price. 2*s* 9*d.* per box.

BEWARE OF SPURIOUS IMITATIONS.

The only GENUINE of each bears the name of "ROWLANDS'," preceding that of the article on the Wrapper or Label.

Sold by A. ROWLAND and SONS, 20, Hatton-garden, London; and all Chemists and Perfumers.

MECHI'S MANUFACTURES.—MR. MECHI respectfully informs his patrons, the public, that his Manufactures at the GREAT EXHIBITION will be found in the Gallery at the north-east corner of the transept.—4, Leadenhall street, London, May 2d, 1851.

P.S. In order to afford room for the great accession of Stock which Mr. MECHI has provided to meet the demand consequent upon the anticipated influx of visitors to London during this season, he has fitted up an additional Show-Room, and other extensive improvements, to which he earnestly invites public attention.

TRANSPLANTED TURNIP SEED.

R. JOSLING begs to offer to Agriculturists his very excellent variety of PURPLE-TOP SWEDE, a cross between the Golden Melon and the Liverpool, decidedly one of the best in cultivation—a heavy cropper, stores well, best quality, seed warranted growth of 1850, from Transplanted Roots, at 1*s.* 3*d.* per lb.

All orders of 25 lbs. and upwards carriage free to any Railway Station in England, or packet office in London. A remittance must accompany the order.

ROBERT JOSLING, General Seed Warehouse, St. Alban's, Herts.

---

NEW AND SUPERB YELLOW DAHLIA, "WHITMORE'S VICTORIA REGINA." Bright yellow lightly tipped with rich brown, large size; when well grown, closely shaded, it becomes clear yellow (see *Gardeners' Chronicle* of September 28, 1850). Strong plants now ready, 10*s.* 6*d.*; the usual discount to the trade. The following Gentlemen have ordered plants and have consented to become agents for its sale: Mr. Rogers, sen., Nurseryman, Southampton; Mr Rogers, jun., Nurseryman, Southampton; Messrs. Page and Co., Nurseryman, Southampton; Messrs. Clarke, 39, King-street, Covent-garden; Mr. Spary, Florist, Ventnor, Isle of Wight; Messrs. Wood, Maresfield, Sussex; Messrs. Cobbett, Horsell, Surrey; Mr. Thompson, Florist, Iver, near Uxbridge; Mr. Dimmirk, Florist, Ryde, Isle of Wight.

Ford Nurseries, Newport, Isle of Wight.

---

The above are confidently recommended as being of superior quality, and may be had of WILLIAM DENYER, Seedsman and Florist, 82, Gracechurch-street, London.

N.B.—A Dahlia List just published, containing all the new and choice varieties, may be had on application.

---

"KOH-I-NOOR."

NEW AND ELEGANT FUCHSIA.—Fine plants are now ready to be sent out of this superb and unrivalled Fuchsia KOH-I-NOOR, which has proved itself one of the finest of the dark varieties. The flowers of extra large size, brilliant and very glossy colours; tube and sepals rich crimson; the corolla a fine purple; sepals well reflexed, showing the rich corolla to great advantage, and an abundant bloomer; the plant is also of very superior habit, and first-rate for exhibition; no collection can be complete without this forming the centre. It will also be found a most useful plant for the Nurseryman, as it continues in bloom for six months, the flowers always retaining their fine colour, and hangs well on the plant. It was seen by the following first-rate judges when in bloom last season: G. D. Fisher, Esq.; Mr. J. Pond, of Devonshire Cottage; Mr. Coles, Gardener to Miss Bayley; Mr. Carmichael, Gardener to G. Tugwell, Esq.; Mr. Hogg, Gardener to General Andrews; Mr. Grant, Gardener to G. Sims, Esq.; Mr. Wooton, Gardener to the Rev. E. D. Rhodes; Mr. Drummond, Nurseryman; Mr. Scott, Bathford; Mr. Freeman, assistant to Mr. Griffin, Nurseryman, all of Bath; and Mr. Ivery, of Peckham, London, all of whom passed their opinion in the following manner: "Your Fuchsia is one of the finest dark varieties we have yet seen; the habit is certainly splendid, and there will be no doubt as to its giving satisfaction to all who grow it."

Fine strong plants, 1 foot high, such as will make good specimens this season, will be sent, on receipt of the amount of 10*s.* 6*d.*, hamper and package included; smaller ditto, such as can be sent by post, 7*s.* 6*d.* each, box and postage included, when remittance accompanies the order. The usual allowance to the trade when three plants are taken.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath.

*** Forget-Me-Not, Myosotis azurea grandiflora, can still be supplied at 2*s.* 6*d.* per packet.

---

SUTTON'S SELECTED TURNIP SEEDS AND NATURAL GRASSES.
PERMANENT PASTURE GRASSES,

*Mixed expressly to suit the soil for which they are required, at the reduced prices of* 22*s.* 6*d.* *to* 28*s. per acre.*

SUTTON'S RENOVATING MIXTURE, consisting of Perennial Clovers and fine Grasses, for improving old Parks, Meadows, and Upland Pastures, 10*d.* per pound.

Ashcroft Swedes; Skirving's Liverpool Swede Seed; Sutton's fine sort of purple-topped Swede; Sutton's purple-topped Yellow Hybrid Turnip; the New Lincolnshire Red Globe Turnip; Sutton's early six weeks Turnip; also, Yellow Globe and other Mangold Wurzel, of superior quality, at low prices, as per catalogue, which may be had gratis.

JOHN SUTTON and SONS *are exhibiting, in Class III., at the great Exhibition, their skinless Chevalier Barley, and their purple-topped Hybrid and Lincolnshire Red Turnips.*

*From a Clergyman, an eminent Agriculturist, and Member of the Royal Agricultural Society.*

"I have had the pleasure of praising your Seeds in many quarters beside that to which you refer. This I have done from a sense of justice only."

*Another Clergyman writes us—*

"My Turnip crops are the admiration of all the farmers round, especially the Swedes and your Purple-topped Hybrid. I hope you have some of the same kind this year, as I am certain the superiority in my crops is mainly owing to the stocks."

*The above are similar to hundreds of others.*

N.B.—Instructions for sowing accompany every parcel of Grass Seeds; and any other information required by post will be promptly given.

*Goods delivered free of carriage to any Office in London, Bristol, Gloucester, Exeter, Southampton, &c.*

Reading, Berks, May 10.

FINE NEW HYBRID STATICE, "STATICE HALFORDII."

MESSRS. VEITCH AND SON have much pleasure in offering this beautiful hybrid Statice, which was raised by Mr. Blackmore, gardener to Mrs. Halford, of Newcourt, near Exeter, from the seed of S. macrophylla crossed with S. frutescens. The plant is of fine habit, intermediate between its two parents. It is a most abundant bloomer and altogether a very great acquisition to this lovely tribe of plants. It is named in compliment to the lady in whose beautiful gardens it was raised.

Well-established Seedling Plants ... ... 5*s.* each.
Do. Do., to the Trade, 42*s.* per doz.

N.B.—A few fine strong Plants of the new STATICE MACROPHYLLA, in 32-sized pots, 7*s.* 6*d.* each.—Exeter, May 10.

---

AUX BOTANISTES ETRANGERS.

BEAUTIFUL NEW LOBELIA, SYMONS'S "AURORA."—This fine Lobelia was raised by C. Symons, Esq., of Lyme Regis, Dorset, who is justly famous for his success in hybridising, and the cultivation of Lobelias. It is a fine deep mulberry crimson, of good habit, with long panicles of bloom, a robust and hardy grower. It is distinct from all others, and will be found a great acquisition.

Messrs. VEITCH and SON can now supply established plants at 5*s.* each, or to the trade, six for 21*s.*—Exeter, May 10.

---

STORY'S SUPERB SEEDLING FUCHSIAS.—FUCHSIA PRINCE ARTHUR (STORY'S).—This is the finest of all the double corolla flowers yet raised and offered by Mr. Story. The corolla is of intense purple and well formed; the tube and sepals are a fine scarlet, smooth and without excrescence, the sepals being sufficiently reflexed to show the corolla to advantage. It is a free bloomer, of good habit and a great novelty. Strong plants, 10*s.* 6*d.*

FUCHSIA ATTRACTION (STORY'S).—This is a very attractive flower, of extra large size and brilliant colours. The tube and sepals are vermilion, the corolla a fine purple, and rendered very conspicuous by the sepals reflexing. A free-flowering and saleable variety. Strong plants, 7*s.* 6*d.*

FUCHSIA DEVONIENSIS (STORY'S).—This is a fine variety, of excellent habit, with a short scarlet tube, and sepals of fine texture; corolla beautiful, light violet, and well formed. It is an abundant bloomer, and will be an acquisition to every collection. Strong plants, 7*s.* 6*d.*

The set of three, taken together, package included, for 21*s.*, for cash (prepayment). The usual discount to the Trade.

Messrs. VEITCH and SON have much pleasure in offering the above beautiful Fuchsias. They are seedlings raised in 1849, and proved in 1850 by W. H. Story, Esq., of Whitehill, Newton Bushell, and were selected from a vast number of seedlings. They are all perfectly distinct, and worthy of general cultivation. Mr. Story's well-known character as a raiser of seedlings will be a sufficient guarantee that he would permit nothing to be sent out, with his name attached, that was not of first-rate character, and calculated to give satisfaction.

N.B.—A remittance or reference from unknown correspondents required; this will be strictly adhered to.

Exeter, May 10.

---

TO BE SOLD, A PORTABLE SPAN-ROOF GREENHOUSE, 13 feet by 11 feet.—For particulars, apply personally to Mr. J. LEWIS, Stamford-hill, near London.

---

EPPS'S IMPROVED REGISTERED SULPHURATOR, for destroying the Mildew and Mould in Grapes, Hops, Roses, Heaths, Pansies, Fruit Trees, and Agricultural and Horticltuural produce.

The Inventor submits this Machine with great confidence, as being the most useful and perfect of its kind invented. The construction is simple, strong, and effective, and can be used by the most inexperienced hand. It has been described in the *Gardeners' Chronicle*, and highly commended by Dr. Lindley, Dr. Plomley (in his lectures on the Mould in Hops), the editor of the "Gardeners' Magazine of Botany," and many eminent Gardeners and Agriculturists.

Manufactured and sold wholesale by BARBER and GROOM, Holborn, and to be had of all Seedsmen, Florists, Ironmongers, and the Inventor. Price 20*s.* and upwards.

Maidstone, May 10.

WARWICKSHIRE HORTICULTURAL EXHIBITION.—THE FIRST GRAND HORTICULTURAL FETE of the season (open to all England), will take place within the splendid and spacious Pavilions, specially erected for the purpose, in the Jephson Gardens, Royal, Leamington, on Wednesday, May 28, 1851, when prizes of upwards of 100*l.* will be offered for Competition, for Stove and Greenhouse Plants, Orchids, Heaths, and Ericas, Geraniums, Roses, Fuchsias, Achimenes, Gloxinias, Gesneras, Pansies, Pinks, Calceolarias, Fruits, Vegetables, and various Miscellaneous Productions; schedules of which may be obtained from the Secretary, at the Entrance Lodge of the Gardens. By the kind permission of Lieut.-Col. HODGE, the splendid Band of the 4th Dragoon Guards will attend on this occasion; also the celebrated German Band, specially engaged for the Jephson Gardens. Admission: from One o'clock to Half-past Three, 2*s.*; from Half-past Three till Six, 1*s.*; from Six till Seven, 6*d.* each; Children, 6*d.* each.

DAHLIAS.

JOHN KEYNES, FLORIST, Salisbury, is now prepared with extra strong plants of the followng New and First class DAHLIAS:—

| | |
|---|---|
| Yellow Superb | Baltic |
| Hon. Mr. Herbert | Antoinette |
| Beauty of Kent | Miss Pope |
| Summit of Perfection | One-in-the-Ring |
| Nepaulese Chief | Miss Herbert |

The whole stock of these are in the possession of JOHN KEYNES, and Prizes for the best Six Blooms from the above will be given at three of the leading Exhibitions of the season. Orders for Dahlias from other growers faithfully executed in conjunction with his own.—Salisbury, May 17.

HUGH LOW AND CO.'S NEW CATALOGUE OF PLANTS is just published, and will be sent free on prepaid application.—Clapton Nursery, London.

ROSES, IN POTS, FOR PLANTING OUT.—A Descriptive Catalogue of AUTUMNAL ROSES has been recently published, in which are inserted some new Hybrid Perpetual Roses, plants of which can be had in pots, grafted on Manettii Rose stocks. The above is sent free per post, on application to THOMAS RIVERS, The Nurseries, Sawbridgeworth, Herts.

TULIPS.

C. TURNER'S Collection is now in fine bloom. Parties desirous of inspecting the same, should do so before the 25th. Trains every hour throughout the day.
Royal Nursery, Slough, Bucks.

"KOH-I-NOOR."

NEW AND ELEGANT FUCHSIA.—Fine plants are now ready to be sent out of this superb and unrivalled Fuchsia KOH-I-NOOR, which has proved itself one of the finest of the dark varieties. The flowers of extra large size, brilliant and very glossy colours; tube and sepals rich crimson; the corolla a fine purple; sepals well reflexed, showing the rich corolla to great advantage, and an abundant bloomer; the plant is also of very superior habit, and first-rate for exhibition; no collection can be complete without this forming the centre. It will also be found a most useful plant for the Nurseryman, as it continues in bloom for six months, the flowers always retaining their fine colour, and hangs well on the plant. It was seen by the following first-rate judges when in bloom last season: G. D. Fisher, Esq.; Mr. J. Pond, of Devonshire Cottage; Mr. Coles, Gardener to Miss Bayley; Mr. Carmichael, Gardener to G. Tugwell, Esq.; Mr. Hogg, Gardener to General Andrews; Mr. Grant, Gardener to G. Sims, Esq.; Mr. Wooton, Gardener to the Rev. E. D. Rhodes; Mr. Drummond, Nurseryman; Mr. Scott, Bathford; Mr. Freeman, assistant to Mr. Griffin, Nurseryman, all of Bath; and Mr. Ivery, of Peckham, London, all of whom passed their opinion in the following manner: "Your Fuchsia is one of the finest dark varieties we have yet seen; the habit is certainly splendid, and there will be no doubt as to its giving satisfaction to all who grow it."

Fine strong plants, 1 foot high, such as will make good specimens this season, will be sent, on receipt of the amount of 10*s.* 6*d.*, hamper and package included; smaller ditto, such as can be sent by post, 7*s.* 6*d.* each, box and postage included, when remittance accompanies the order. The usual allowance to the trade when three plants are taken.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath.

*** Forget-Me-Not, Myosotis azurea randiflora, can still be supplied at 2*s.* 6*d.* per packet.

ROSES.

EDWARD DENYER, NURSERYMAN, Loughborough-road, Brixton, near London, respectfully informs the admirers of Roses that his collection of Standard and Dwarf Roses is now in full bloom, in the Rose house. Calceolarias, fine spotted varieties; Geraniums, Fuchsias, Verbenas, &c. A Catalogue sent on application.

E. D. informs his kind patrons that he has no Seedshop in London.

JOHN KERNAN, in soliciting further favours, begs to mention the fact that Annuals, Perennials, &c., may be sown to greater advantage all this month, than at the usual period. This arises from the hitherto ungenial state of the weather, which has been a severe check to early vegetation, in consideration of which J. K. will feel happy to make every allowance to customers whose purchases may have been injured by the untowardness of the season.

Collections may be had from 5*s.* to 20*s.*

Also the following Agricultural Seeds, &c.

TURNIPS.

| Ditto Ditto Bridal Bouquet ... ... " | 10 | 6 |
| Ditto Ditto Golden Admiration ... " | 15 | 0 |
| POTENTILLA ANTWERPENSIS ... ... ... " | 7 | 6 |
| Ditto bicolor grandiflora ... ... ... " | 5 | 0 |
| FUCHSIA, Prime Minister (Henderson's) ... ... " | 7 | 6 |
| Ditto Resplendent Do. ... ... " | 7 | 6 |
| Ditto Lord of the Isles Do. ... ... " | 7 | 6 |
| Ditto Madame Sontag Do. ... ... " | 7 | 6 |
| ALCEOLARIA MONARCH Do. ... ... " | 7 | 6 |
| Ditto Queen of England, Do. ... ... " | 7 | 6 |
| Ditto Flora M'Ivor Do. ... ... " | 7 | 6 |
| Ditto Golden Knight Do. ... ... " | 7 | 6 |
| Ditto Marchioness of Douro, Do. ... " | 7 | 6 |
| Ditto Conspicuum Do. ... ... " | 7 | 6 |

For descriptions of the above, see Spring Catalogues for 1851, which will be ready for delivery early in May, and will be sent post free on application.

E. G. H. also calls attention to the following new Strawberries:

PREMISSES DE BAGNOLET, very late, good plants in *s. d.* pots ... ... ... ... ... ... ... ... each 1 0
CREMONT'S PERPETUAL, a double bearing variety of superior quality, good plants in pots ... ... each 2 6
Wellington Road Nursery, St. John's Wood, May 17.

NEW DAHLIAS; E. FOSTER'S, Esq., CHOICE PELARGONIUMS; PICOTEES, CARNATIONS, HOLLYHOCKS, PANSIES, &c.

WILLIAM BRAGG, Star Nursery, Slough, begs to say his Catalogue of the above Flowers is now ready, and can be had on application. His choice SEEDLING DAHLIAS will be sent out the first week in May at 10*s.* 6*d.* each, viz.:—

ADMIRAL, rich lilac, very constant, gained first Seedling prize, 25*s.*, at the Royal South London Exhibition; 21*s.* Shacklewell Open Shows, &c., fourteen first class certificates; the most successful flower of the year.

CARMINA, rich carmine, constant show flower, gained six first class certificates, &c., shown in several winning stands.

The Hon. MRS. ASHLEY, waxy white, tipped with rose, splendid show flower, &c. W. B. thinks it the best Dahlia of the season; was awarded by Dr. LINDLEY a certificate of merit at the Horticultural Society, &c. Gained five first class certificates.

QUEEN OF FAIRIES, Domeyer. W. BRAGG has purchased the stock of this fine and constant fancy Dahlia, from the above amateur, who will give 5*l.* in prizes the next season for this flower. It gained a Seedling prize and first class certificate, with Edwards's Mrs. HANSARD; at the Royal South London Open Show Exhibition five first class certificates.

W. B.'s stock of Picotees, Carnations, and Pinks are strong and good; the best Hollyhock Seed ever sent out can be had in 2*s.* 6*d.* and 5*s.* packets, post paid, for prepayment.

CHEAP DAHLIAS.

HENRY LEGGE is now sending out all the leading Flowers of 1851, at 9s. to 12s. per dozen; the good old, from 2s. to 4s. per dozen.—Catalogues can be had by sending one postage stamp to HENRY LEGGE, Marsh Side, Lower Edmonton, Middlesex.

ROBERT WHIBLEY offers strong plants of that superb Geranium FOQUETT'S MAGNIFICENT, at 3s 6d. each. Bedding Plants, choice and strong, in pots, 21s. per 100. Catalogues for one stamp, containing a select and extensive variety of plants.—Nursery, Kennington, London.

CHEAP BEDDING PLANTS.

JOHN HAYES, FLORIST, Farnham, Surrey, begs to state that he is prepared to send out BEDDING PLANTS from 1s. 6d. to 3s. per doz.; sent post free for 1s. 8d. per dozen, when three dozen are taken.

Descriptive Catalogues sent on the receipt of one postage stamp. Prizefighter and Farnham Castle Cucumber, 1s. per packet.

CALCEOLARIA "SULTAN."—This very desirable and shrubby CALCEOLARIA for bedding is now on sale, at 5s. each, or two guineas per dozen; habit dwarf, with large dark flowers; it is very hardy, and peculiarly adapted for the flower garden, throwing up a constant succession of its rich ruby-coloured trusses of bloom throughout the season.

Though of a different colour, it is equal for bedding purposes to the well known Calceolaria Kentish Hero, sent out five years since.

JOHN ANDREW HENDERSON and Co., Pine-apple-place, Edgware-road, London.

SHIRVING'S IMPROVED TURNIP SEEDS.

WM. SKIRVING begs to announce to his friends and the public, that he has fixed the price of his IMPROVED SWEDE, and also the PURPLE-TOP YELLOW-BULLOCK, at 9d. per lb.

In consequence of W. S. having extended the growth, and having had a very abundant crop of the Seed of his Improved Turnips, he is this season able to offer it at the above reduced price, and he is also induced to take this step to prevent Agriculturists being imposed upon by the sale of spurious Seeds, offered at a low rate, under his name.

W. S. can, with perfect confidence, recommend these Turnips as being the best now in cultivation, in every respect, whether for the greatest crop, the best quality, or for keeping, according to the time of sowing. All other Agricultural Seeds, of the best quality, at very moderate prices. A remittance, or reference, is requested from unknown correspondents.

N.B. W. SKIRVING has no Agent in town or country.

Queen-square, Liverpool, May.

SHADING CANVAS, 4d. per Square Yard. To be had in any quantity from WILLIAM HAMILTON, SEEDSMAN, &c., 156, Cheapside, London.

Also BEDDING and HERBACEOUS PLANTS of every description.

FLOWER SEEDS for present sowing, in packages of 12 varieties, for 2s. 6d.; or 25 varieties, 5s.

Labels, Garden Knives, Flower-gatherers, Thermometers, and every other article useful in gardening, his prices for which are excessively moderate.

Address, 156, Cheapside, London.

N.B. Agent for the Registered Rose Girdle.

DEANE'S WARRANTED GARDEN TOOLS.—Horticulturists, and all interested in Gardening pursuits, are invited to examine G. and J. DEANE'S extensive Stock of GARDENING AND PRUNING IMPLEMENTS, best London made Garden Engines and Syringes, Coalbrookdale Garden Seats and Chairs.

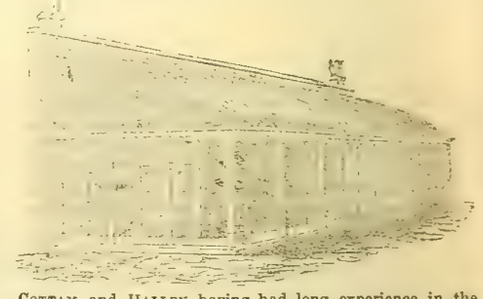
Height in front, 3 feet 6 ins., wood and glass; 3 feet 6 ins. brickwork.

These Greenhouses are prepared in such a manner that any country carpenter can fix them with ease. A plan is sent free for the brickwork, &c.

Estimates for erecting and heating the above, on application. Lists of prices for Sashes, Doors, &c., post free, on application.

J. LEWIS, Horticultural Works, Stamford-hill, Middlesex.



GRAY AND ORMSON, Danvers-street, Chelsea, solicit the attention of the Nobility, Gentry, and Gardeners, to their superior manner of Erecting and Heating every description of Building connected with Horticulture. The work done by them at the Right Hon. the Earl of Kimmoey's, to which they have had the honour of referring so long, still continues to give perfect satisfaction. Mr. Kinghorn will be happy to show the work and give any information.

They also beg to refer to the houses built by them during the past season, for the Worshipful Apothecaries' Company of London, in their Botanic Garden at Chelsea. Mr. Moore, the Curator, will kindly show the work, and answer any inquiries. They beg also to say the Building only is referred to, as the Heating Apparatus was not erected by them.

GRAY and ORMSON have also the honour of referring to many of the nobility and gentry in the country, and to several of the London nurseries.

N.B. Plans and Estimates furnished free.

COTTAM & HALLEN, ENGINEERS, IRON FOUNDERS, &c., No. 2, WINSLEY-STREET, OXFORD-STREET, LONDON.

COTTAM and HALLEN having had long experience in the erection of HOTHOUSES and CONSERVATORIES (made of Iron or of Iron and Wood combined), and from many improvements they have made during that time, can with confidence undertake to erect such buildings with economy and dispatch.

HOT WATER APPARATUS for heating the above and other buildings (of which they have constructed upwards of 3000), fixed at greatly reduced prices.

COTTAM and HALLEN have on show, at their repository, No. 2, Winsley-street, Oxford-street, a great variety of the following articles, for GARDENS, &c., at Greatly REDUCED PRICES, viz:—

| | |
|---|---|
| Garden Rollers | Hand-glass Frames |
| Garden Engines | Flower Stakes |
| Garden Syringes | Flower-bordering |
| Watering Pots | Flower Stands |
| Garden Vases | Garden Arches |
| Mowing Machines | Garden Chairs |

Every description of Work, both Plain and Ornamental, in wrought and cast iron, for Gardens, &c., &c.

HORTICULTURAL TOOLS and AGRICULTURAL IMPLEMENTS of all kinds.

STRONG IRON HURDLES, strained Wire Fencing, &c.

Show Rooms at the MANUFACTORY, 2, Winsley-street, and 76, Oxford-street, three doors West of the Princess's Theatre.

LINGHAM BROTHERS, 170, Hampton-street, Birmingham, sole Manufacturers of the improved WOOD and ZINC MENOGRAPH, or Label for Garden Borders, Flower-pots, &c., in boxes of 100, &c. The Zinc Labels are highly approved of for their lasting durability; can be written upon with the greatest ease, and, when dry, a permanent inscription is secured. Directions for use sent with each box, including bottle of Metallic Ink.

Sole Agents in London, G. and J. DEANE, Horticultural Implement Warehouse, 46, King William-street, London Bridge.

EXHIBITION OF TULIPS.

HENRY GROOM, Clapham-rise, near London, Florist by appointment to HER MAJESTY THE QUEEN AND TO HIS MAJESTY THE KING OF SAXONY, respectfully informs the Nobility, Gentry, and the Public, that his SUPERB COLLECTION OF TULIPS is now in flower, and can be viewed every day, from 9 o'clock until 6, Sundays excepted. Admittance 1s., Children half price.

PLANTES SUPERBES D'ORANGERIE. — Messieurs les Etrangers, Amateurs du genus Banksia et Dryandra, sont informés qu'une belle collection, comprenante plusieures espèces nouvelles et très rares, se vend à bon prix, chez l'établissement de JOHN HENCHMAN, à Edmonton, près de Londres.—Edmonton, 17 Mai, 1851.

VALUABLE VEGETABLES.—CAULIFLOWERS. — Myatt's improved early, much earlier than the old varieties, more compact and heavier, considered by the raiser as most desirable, quantity very limited; 1s. packets.

BRUSSELS SPROUTS, improved variety, direct from Brussels; 1s. per oz, 6d. per packet.

CABBAGE, MITCHELL'S ENFIELD.—This has been tried at the Horticultural Society's Garden, and pronounced one of the best; 1s. per oz., 6d. per packet.

CABBAGE, CHAPPEL'S COLEWORT, excellent for Winter Greens, 6d. per oz.

CARROT, ST. JAMES', one of the best for small gardens, and shallow or heavy soils; 3d. per oz.

CELERY, COLES' SUPERB RED, very extensively grown last season, and pronounced first-rate; 1s. per oz., 6d. per packet.

LETTUCE, VICTORIA CABBAGE, but little known, but one of the handsomest grown, and which no gentleman's garden should be without.

DUNCAN HAIRS, in offering the above selection from his general List, begs to inform his friends that he warrants them to be as described.

109, St. Martin's-lane, Charing Cross, London.

CHOICE AND CHEAP.—READ THE FOLLOWING!
(Carriage paid; see below.)
Now ready, and may be had gratis on application,
MAY'S DESCRIPTIVE CATALOGUE OF PLANTS, for ornamenting the Flower Garden, and Greenhouse display.

N.B.—All orders above 2l. 10s. carriage paid to London, or to any Railway Station within 150 miles of the Nurseries, and plants given over on smaller orders to compensate for carriage. Our central position and great facility of railway communication enables us to execute all orders with punctuality and despatch.

The Catalogue comprises the following favourites, viz.:—Calceolarias of the best sorts, Cinerarias, Fuchsias, Scarlet Geraniums (for bedding), Verbenas—the very choicest varieties, Petunias, fine Chrysanthemums for autumn display, Liliputian Chrysanthemums (these are little gems, growing about a foot high, and flowering profusely), Salvias, Heliotropes, Phloxes, new and fine; Antirrhinums, fine; various Plants adapted for Bedding, Climbers of sorts, and Roses in selection. s.
ERICAS, 12 fine blooming plants, own selection, per doz., 12
GREENHOUSE PLANTS, 12 miscellaneous sorts, blooming, our own selection, per doz. .. ... ... ... 12
HERBACEOUS PLANTS, in pots, purchaser's selection, per 100 ... ... ... ... ... ... ... ... 63
Do. do. do., our own selection, per 100, 50

The list throughout is divided into sections of the newest and best in each class, and those in more general cultivation; the selection is left to purchasers or ourselves, in the latter case our customers may rely upon our integrity in furnishing good articles, for which we have received many flattering testimonials. Every information given on application.

Address, JOHN MAY, Hope Nurseries, near Bedale, Yorkshire, to whom all Post-office orders must be made payable.

CHOICE CALCEOLARIAS.

JOHN HENCHMAN begs to inform the Trade and Furnishers, that his choice stock of about 4000 SEEDLING CALCEOLARIAS are now in all stages of bloom, at 3l. 5s. per 100. Amateurs may supply themselves with choice and distinct varieties at 1s. each. On receipt of Post-office orders, any quantity selected and packed with care.—Edmonton, May 17.

GRASS AND OTHER SEEDS.

THOMAS GIBBS AND CO., the Seedsmen to the "Royal Agricultural Society of England," corner of **Half Moon-street** Piccadilly, beg to call the attention of their friends to the following Seeds:

Mixtures of selected Natural Grasses for laying down Land to permanent Meadows and Pastures, apportioned to suit the nature of the soil.
Mixtures for portions of Parks near Mansions.
Mixtures for Garden Lawns and Grass Plots.
Mixtures for renovating Old Pasture Land.
Italian and other Rye-grasses.
White Belgian and Red Altringham Carrots.
Gibbs' new very large Parsnip.
Orange Globe Mangold Wurzel.
Long Red and other kinds.
Drumhead and Thousand-headed Cabbages.
Swedes, Hybrids, and other Turnips.
Clovers, Kohl Rabi, French and English Furze.
Sainfoin, Rape, Tares, White Mustard, and all Agricultural and Kitchen Garden Seeds, &c.

Priced Lists are now ready, and will be forwarded free, on application, by post, or otherwise, to corner of **Half Moon-street** Piccadilly, London.

MEADOW AND PASTURE GRASS SEEDS.

GEORGE GIBBS AND CO. beg to notice their mixtures of GRASS SEEDS for Laying Land down to Permanent Grass, are now ready for delivery. They have reduced the price to 30s. per acre, allowing 2 bushels 12 lbs. to the acre.

Mixed sorts for improving old Grass Land, 1s. 2d. per lb.
Fine sorts, for forming Lawns, 1s. 3d. per lb. Directions for sowing will accompany the Seeds.

GEORGE GIBBS and Co. will feel happy in sending general priced Catalogues of Agricultural and Garden Seeds, on application to 26, DOWN-STREET, Piccadilly, London.

SULPHUR VERSUS MILDEW.

FRY'S SULPHURATOR IMPROVED. — This Machine, with numerous Testimonials, can be obtained direct from the original inventor of the Sulphurator, GEORGE FRY, Manor House, Lee, Kent. Price 15s.

EPPS'S IMPROVED REGISTERED SULPHURATOR, for destroying the Mildew and Mould in Grapes, Hops, Roses, Heaths, Pansies, Fruit Trees, and Agricultural and Horticltuural produce.

The Inventor submits this Machine with great confidence, as being the most useful and perfect of its kind invented. The construction is simple, strong, and effective, and can be used by the most inexperienced hand. It has been described in the *Gardeners' Chronicle*, and highly commended by Dr. Lindley, Dr. Plomley (in his lectures on the Mould in Hops), the editor of the "Gardeners' Magazine of Botany," and many eminent Gardeners and Agriculturists.

Manufactured and sold wholesale by BARBER and GROOM, Holborn, and to be had of all Seedsmen, Florists, Ironmongers, and the Inventor. Price 20s. and upwards.

Maidstone, May 17.

HORTICULTURAL SOCIETY OF LONDON.—NOTICE is hereby given that the Second EXHIBITION of FLOWERS and FRUIT, in the SOCIETY'S GARDEN, will take place on SATURDAY, June 7th.

Tickets can be procured at this Office upon presenting the order of a Fellow, price 5s. each; or, on the day of the meeting, at Turnham-green, price 7s. 6d. each.

PRIVILEGE OF FELLOWS.—Each Fellow of the Society has free personal admission to these Exhibitions without a ticket. He may also personally introduce a friend with an Admission Ticket at half-past Twelve, at Gate No. 4 in the Duke of Devonshire's road; or, if unable to attend personally, his wife or sister may represent him, provided she is herself furnished with an admission ticket to which his signature is attached. Similar privileges belong to Ladies who are Fellows of the Society.

Messieurs les étrangers qui desireront se procurer des billets d'admission pourront en obtenir des mandats en s'addressant à leur Ambassade ou à leur Consulat.

21, Regent-street, London.

HORTICULTURAL SOCIETY OF LONDON.

NOTICE is hereby given, that the
EXHIBITIONS AT THE GARDEN,
In the year 1852, and in each succeeding year, until further notice, will take place on the
SECOND SATURDAY
IN THE MONTHS OF
MAY, JUNE, AND JULY.

21, Regent-street, May 13, 1851.

The Gardeners' Chronicle.

*SATURDAY, MAY* 17, 1851.

MEETINGS FOR THE ENSUING WEEK.

COUNTRY SHOWS.—Tuesday, May 20: South Devon Botanical and Horticultural.—Thursday, May 22: Bath Horticultural, and Liverpool Horticultural.

IT is not a little remarkable that a nation so advanced as Sweden in all that relates to natural science, should have considered it unnecessary for its BOTANICAL GARDENS to be placed under the care of a person practically conversant with gardening. We understand, however, that such is the case; and that even the Garden of Upsal, which has furnished the materials of scientific investigation to so many celebrated professors—to the two RUDBECKS, the two LINNÆUS', THUNBERG, and WAHLENBERG—was still, at the decease of the last lamented naturalist, intrusted to the management of subordinates far inferior to what the present state of horticulture demands.

Those who are familiar with the working of such establishments as Botanical Gardens will, we doubt not, agree with us in the opinion that two wholly distinct duties have to be performed in them. The first is the botanical superintendence and the application of the materials which the garden may contain to the purposes of instruction; the other is the horticultural superintendence, by means of which those materials are preserved and augmented. The last provides the raw material of science, the first works it up and converts it into forms it did not before possess.

In saying this we do not by any means intend to say that the gardener is not to be a man of science. Quite the contrary. The more science he has the better, provided it is combined with that practical horticultural skill which can only result from much experience; just as great scientific knowledge itself results from a long and assiduous examination of the subjects to which it relates.

A botanist is not necessarily a gardener, any more than a gardener is necessarily a botanist. Very few men indeed have, in fact, combined the two qualities: and it is as unwise to entrust the cultivation of plants to a mere botanist, as it would be to call upon a mere gardener to undertake the duties of a botanical professor.

If these remarks should, as we hope they will, receive the consideration of our Swedish readers, we can hardly doubt that they will have the effect of putting an end to what must be admitted to be a great mistake. Unless, indeed, it should be thought that it matters little in what state of health a plant exists in a botanic garden, provided it can be found there, or at least in the catalogue. It is, however, now generally acknowledged that a live plant conveys little information to students unless it is in its state of natural health; and we cannot but entertain grave doubts whether their natural health will ever be secured to plants under artificial management, in the absence of the direction of those whose lives have been spent in the business of cultivation.

While upon this subject we may add, for the information of our botanical readers, that WAHLENBERG has bequeathed to the University of Upsal all his considerable fortune, a library of great value, and his herbarium, upon condition that botany should remain, as heretofore, united to the faculty of medicine. But there is a struggle on the part of the Faculty of Arts, or of Philosophy, in the University, to obtain the botanical chair, and, in the event of their succeeding, the property left by WAHLENBERG falls to his heir-at-law. It is understood that this question, which the King alone can decide, has given rise to no small conflict of opinion, the one side insisting that Natural History is a branch of general education; the other maintaining that it is a special department of medicine, treating of the functions and structure of organic bodies. We must own that, to us, this dispute seems hardly worthy of a great University.

IN speaking the other day of the important timber from Van Diemen's Land (see p. 291), now exhibited in the Crystal Palace, we undertook to consider whether or not there is any reasonable probability of the plants producing it becoming cultivated advantageously in any part of Great Britain or Ireland. At first sight it would seem that experience directs us to answer the question in the negative, for we have at present no sufficient evidence that the Tasmannian Flora has begun to establish itself in these islands. We know, indeed, that a *Leptospermum* has existed for many years in a warm sheltered garden near London, that *Swammerdamia* is an evergreen bush as hardy as a Laurel, that the Van Diemen's Land "Myrtle" (*Fagus Cunninghamii*) has also resisted the frost of Middlesex for two or three years, and especially that in some parts of Devonshire Gum trees (*Eucalypti*) and Wattles (*Acacias*) have grown into trees; but, on the other hand, it is too certain that such plants have been destroyed by unusually hard winters, and that if we have a few cases of species enduring the midland climate of England, we have a far greater number of examples of their shrinking from it.

Nevertheless it cannot be said that any experiment upon the hardiness of Tasmannian plants has yet been fairly tried. It does not follow that the vegetation of the mountainous districts should perish because that from the lowlands of Hobart Town proves tender; nor can we infer, because *Acacia lophantha* and some continental *Eucalypti* have been struck down by even a Devonshire frost, that therefore the species of more southern and severer regions would share the same fate. What we know of the climate of Van Diemen's land leads to contrary inferences.

It appears from Captain KAY's meteorological observations, made at the Royal Observatory, Hobart Town, in 1847 and 1848, that the climate, although not severe in that sheltered place, is by no means so mild as to distinguish it from the south-western counties of Great Britain and Ireland; the main difference, in fact, consists in the excessive heats for short periods during the summer. In 1847 the thermometer stood at 100° in the shade on the 21st of February, and at 103° on the 8th of December; at midnight, on the first occasion, it remained at 73°, and on the second a black bulb thermometer rose in the day to 156.5°. But in 1848 the temperature never exceeded 91° in the shade. On the other hand, the winter temperature was as follows:—

| | 1847. | | | 1848. | | |
|---|---|---|---|---|---|---|
| | Max. | Min. | Mean. | Max. | Min. | Mean. |
| May | 64. | 34.2 | 47.6 | 67. | 34.2 | 49.1 |
| June | 53.4 | 33.2 | 43.1 | 59. | 34.7 | 45.8 |
| July | 55. | 33. | 43.9 | 54.3 | 31.3 | 42.8 |
| August | 65. | 36. | 47.9 | 57.8 | 35.3 | 45.3 |

Nor was this attended with unusual dryness; for if the whole quantity of rain registered in 1847 was only 14.02 inches, it was 23.67 in 1848; and it would appear that an alternation of dry and wet seasons is characteristic of the climate of Hobart Town.

This, we conceive, is sufficiently similar to the climate of the south-west of England, and south of Ireland, to render the naturalisation there of the Hobart Town trees worthy a trial; and we see no reason to doubt that the Blue Gum Tree, Muskwood, Myrtles and Wattles of that locality would decorate the Killarney district as freely as the Arbutus itself. But in truth the climate of the observatory of Hobart Town, although on the south of Tasmannia, by no means represents the extreme climate of the island, as will be seen from the following extracts from Mr. BACKHOUSE's useful Journal:

"A single Lemon tree exists in a garden at New Norfolk, and another at O'Brien's Bridge, but the climate is not warm enough for them, and they are protected during the winter. Cape Pelargoniums (the Geraniums of English greenhouses) endure the winter at Hobart Town, but they are killed by frost at New Norfolk, and at other places in the interior." (*P.* 155.)

*Hobart Town, Aug.* 9.—"The weather at this period was tolerably mild, and generally remarkably fine for the season. We had seldom to use umbrellas as a defence against rain, and the tracked roads

were but little cut up. The tops of the mountains, adjacent to the low country in which we were travelling, were often covered with snow, and there the weather seemed to be wild and stormy." (*P.* 150.)

"The climate (of Hobart Town) is almost too cold for Grapes and Cucumbers, but Apples, Pears, Quinces, Mulberries, and Walnuts, succeed better than in England. Oaks, Ashes, and Sycamores, raised from English seeds, attain to 3 or 4 feet the first year. Bees have been lately introduced. The first hive swarmed 16 times this summer! Many of the little shrubs which ornament English greenhouses are natives of this country, so that the gardens here have the advantage of having them in the open ground, and to these are added several from Africa and New South Wales. Here also are some fine young Norfolk Island Pines." (*P.* 23.)

*Mount Wellington, near Hobart Town.*—"In company with two young surgeons I again ascended Mount Wellington, and collected specimens of various plants. Though the summer is advancing, snow fell dry on the top of the mountain, and the cold, with a high wind, was so intense, that I was unable to restore circulation in my hands by rubbing them with snow. Some of my fingers were consequently numb for several days after. Another of our company became violently affected with cramp, from which we all suffered in some degree. Though the snow was insufficient to protect vegetation from the frost, many plants which were in flower did not seem to be injured by it, yet they cannot endure the continued cold of an English winter. (*Nov.* 11; *p.* 224.)

"Proceeding across a salt marsh to the shores of Frederick Henry Bay (S.E. of island), we saw the Princess Royal, a vessel with female emigrants from England, driving from her anchors, in a violent storm of wind and snow (*Aug.* 23). The snow was about 3 inches thick in the morning. The snow among trees in full foliage presented a novel appearance to an Englishman. All the trees and shrubs of this country are evergreens; and, with the exception of the little patches of land that have been cleared by settlers, may be said to cover the whole country. The thermometer at Richmond was at 27° several times this winter." (*Aug.* 24; *p.* 65.)

*Hampshire Hills, N. of Island.*—"Notwithstanding it is now Midsummer, the weather is cold, with hail and sleet. The climate here is much colder than that of the coast. (*Dec.* 29; *p.* 118.) Heavy rain fell, and the cold became so great, that we were glad to retire to bed early for protection from the piercing wind. By a register kept by my friend JOSEPH MILLIGAN, of the quantity of rain that fell at the Hampshire Hills, from 1835 to 1839, the mean annual quantity appeared to be upwards of 67 inches. In 1837 it exceeded 80 inches. The greatest fall in one day in the five years was upwards of 4 inches. Notwithstanding it was summer, and large patches of ground were white with the blossoms of Diplarrhena moræa, an Iris-like plant, common in the colony, the Barn Bluff, and other mountains adjacent, were covered with fresh snow, and the tops of the Potatoes at Chilton were touched with frost. The land here is high, with marshy flats and grassy forest. The trees of the open ground are chiefly stringy-bark, 20 to 30 feet in circumference, and 70 to 100 feet high." (*Jan.* 22; *p.* 126.)

*Launceston, North of Island.*—"This morning the mountains visible from Launceston to the north-east were covered with snow. This was also the case in the south of the island, down to 1000 feet above the level of the sea. Snow is unusual in summer in this country; notwithstanding summer frosts are by no means of rare occurrence. (*Feb.* 27; *p.* 134.) During this period, the weather was frosty at night, the thermometer frequently falling to 25°. From the adjacent hills, the town, in a morning, often appeared as if it were based on clouds, as the fog, to which it is liable, dispersed. The days were generally clear and warm." (*May* 10; *p.* 149.)

*Macquarie Harbour.*—"The common temperature of the winter at Macquarie Harbour was 43° in clear weather, when the wind was from the south, and 52° when cloudy, with the wind from the north. Frost and great heat were of rare occurrence. Rain was said to have fallen on five days out of seven, during 10 months in the year, from the formation of the settlement in 1822." (*P.* 55.)

These extracts abundantly prove, we think, that some of the vegetation of Van Diemen's Land ought to find itself at home even in our midland counties. And when we see that the Eucalypti, called stringy bark trees, grow 10 feet in thickness where Potatoes are touched by frost at Midsummer, we cannot but think that an attempt at introducing Tasmannian plants into shrubberies and plantations would be, to a considerable extent, likely to meet with success.

## ORCHIDS FOR THE MILLION.—No. I.

BEING desirous of growing a few of the more showy Orchidaceous plants, but as neither myself nor my then gardener were acquainted with the mode of their cultivation, I applied for some information on this head to Mr. Williams, the gardener of my neighbour, Mr. Warner, and who kindly from time to time gave me such instruction as was necessary for a beginner. There is a notion amongst gardeners that the cultivation of these plants is attended with great difficulty; that different houses for different climates are necessary, and that the secret of good culture is only known to few; that, in fact, no one but those having a large establishment, and a gardener expressly skilled in Orchidaceous culture, should attempt to grow them. Mr. Bateman, in the preface to his great work, intimates that their cultivation is to be left to the aristocratic, whilst the more humble florist is to be confined to his Carnations, Auriculas, Dahlias, and such-like flowers. Mr. Williams' plan seemed to me very simple, and also that one house might easily be made to answer the purpose, if properly managed, at least for those who are not ambitious of possessing a very large collection, or of growing such as are most impatient of culture; having derived much advantage from the instruction afforded to me, I recommended Mr. Williams to make notes of his mode of culture, and since these were written I have advised him to publish them. I trust that, to humble beginners like myself, I have done good service by this advice, and I cannot but think that ere long many will be induced to attempt the cultivation of this beautiful tribe of plants, who, for want of plain instructions, have hitherto been deterred from making a beginning. A very small house is sufficient, hot-water pipes or tanks are now cheap, and a small boiler may be had for 2*l.* 10*s.*, or less; and glass (thanks to Sir Robert Peel), is also within the means of the humblest gardener, and those who refer to Mr. Rivers' account in your Paper of how to make cheap lights, and build cheap houses, will find that for 40*l.*, or less, a very sufficient Orchid-house, with hot-water apparatus, may be put up.

Knowing the pleasure derived by many in the humblest classes from the cultivation of flowers, and how much talent, patience, and ingenuity are often displayed by such amateurs, I feel gratified by the hope that I may possibly be the means of increasing the harmless amusement of many. It is not likely that Mr. Williams' instructions will interest or inform those cultivators—Mr. Mylam, Mr. Blake, Mr. Bassett, Messrs. Veitch, Rollisson, &c., or others at the head of the great collections of this country; it is merely for the benefit of the beginner that they are intended. As regards the fitness of Mr. Williams to instruct, the best proof I can offer of this is, that for some years he has exhibited, both at Chiswick, and in the Regent's Park, and a reference to the prize lists will show that he was always successful; and during the past year obtained 23 gold and 12 silver medals for Orchids, and 14 other silver ones for Ferns. Mr. Warner's collection not being so large as those of many others, it was only the last two years that Mr. Williams competed in the highest class of 20 plants. *Dodman.*

## FOREIGN GARDEN GLEANINGS.

(ST. PETERSBURGH.)

FLORISTS.—Among the different florists of St. Petersburgh, M. Alwarch, a German, stands first. He cultivates nothing but those plants which are universally sought after in Russia, viz., good evergreen shrubs and bushes. These plants, which are brought into Russia in pots, are sold in large quantities to the nobility, who, in winter, and the commencement of the fine season, use them for the internal decoration of their houses. We may mention more especially Gardenia florida; Ixora coccinea and others; Lantana; Musa; Æschynanthus; Asclepias curassavica and Hoya carnosa; Echium; Gesnera; all of which are cheaper in St. Petersburgh than in Paris. Such is not the case with the hundred-leaved, crested, four-seasons and Belladonna Roses, which, when in flower, fetch 2*s.* 6*d.* and 5*s.* The Myrtle-leaved and Chinese Orange trees are also very dear, as are also Pelargoniums and Fuchsias. Franciscea odorata and Hopeana are great favourites; Begonias and Gloxinias cost half as much again as they do in France. Camellias and North American Azaleas fetch most extravagant prices. The same gentleman has a large collection of Rhododendron ponticum maximum, and other species; but we look in vain for out-door Azaleas, Calceolarias from Chili, or Cacti from tropical America. As for Myrtles, Pomegranates, Laurels, Jasmines, climbing Roses, Dahlias, Pinks, and Spanish Jasmines, they are rare and costly.

Besides evergreen shrubs, M. Alwarch cultivates, though upon a smaller scale, out-door shrubs. We principally noticed some bushy plants, capable of resisting the severe frost of the country, such as Cornus mascula, alba, and sanguinea; Elders; Spiræa lævigata, rosea and ulmifolia; common Lilacs; Chamæ cerasus, Snowdrops, Snowberries, Service-trees, Sweet Chestnuts, Pteleas, Poplars, especially the true sweet-scented suaveolens; Caragana, with which beautiful undulating hedges are made; the charming red-fruited Acer tataricum; Buckthorns, and particularly the one from Tartary, which constitutes a large part of the live hedges in the country; lastly, Cratægus purpurea, with its handsome foliage, far surpassing in colour that of Cr. alba. The latter plant attracted my especial attention; its beauty, the rapidity of its growth and other excellent qualities, enable the Russians to make live hedges, which we should very much like to see introduced into our own country.

FLOWER MARKETS.—One of the first things which strike a stranger entering St. Petersburgh is the evident passion which all the inhabitants, rich and poor, old and young, have for flowers. The eye admires, with surprise and delight, the halls and rooms of all classes, which, for eight or nine months in the year, are more like conservatories than the interior of common dwelling-houses; being gay with plants of every clime, whilst out of doors the country is desolated by the severity of the cold. In-doors we find Palms and Figs, Musas, Dracænas, Marantas, the large leaved Arums, Camellias, Rhododendrons, and Azaleas; also some beautiful Leguminosæ, Mimosas, Cytisus in pots, Myrtles of all sorts, Olea fragrans, the large Clethra, different sorts of Laurel; and lastly, but most conspicuous, are the hundred-leaved and four-season Roses, Hyacinths, and other flowering plants.

The working classes, who cannot command a wide range of temperature, prefer such plants as Crinum, Maranta, Hoya carnosa, Asclepias curassavica, and Lantana; Oranges, Jasmines, Plumbago capensis, Ixora, Gardenia, Echium, and occasionally, too, the common Laurel, Cytisus, and Olea fragrans.

The poor, who are compelled to live continually in the town, grow Pelargoniums, Roses, Verbenas, Fuchsias, Wallflowers; and, in spring, Lilies of the Valley.

FLOWER TRADE IN ST. PETERSBURGH.—A fair, which is held as soon as the frosts are over, and which lasts a whole month, viz., from the 25th of May to the 25th of June, is almost exclusively a flower fair; it is at this fair that the nobility and country gentlemen make their purchases for decorating their country houses, to which they are about to retreat. The flowers are supplied almost entirely from Germany. We remarked the hundred-leaved and four-seasons Rose, planted in a sort of hamper; Cherry, Apple, Plum, Service, and Sweet Chestnut trees, a few Pear trees, all shrubs, and selling for double what they do in Paris; the Lilies of Valley, especially, seemed to bear a most exorbitant price. We saw, too, Pæonies, and all sorts of perennial and shrub-like plants.

Flower are sold, too, by travellers, who go from house to house, carrying upon their heads boards upon which the flowers in pots are closely packed. But these pedlars offer their purchasers neither variety nor beauty, a few Wallflowers, Pelargoniums, Fuchsias, Lilies, Echium, Gesneras, Roses, Mignonette, Cinerarias, Verbenas, Phlox, and Justicia, form the whole of their collection.

Although there are many more florists in St. Petersburgh than in Paris, the collections of the former are much more meagre than those of the latter. Their trade in bouquets and flowers in pots is prodigious, far surpassing what we had imagined. *Masson's Report.*

## BRITISH SONG BIRDS.

(CAGE BIRDS, No. 14.)

No. XXX.—I crave the indulgence of my readers this week, for an *hiatus* in the history of the nightingale. It is, however, an *hiatus* which will be found *non valdè deflendus;* for while it gives time to the newly-caught birds to ruminate on their sudden and cruel change from liberty to incarceration, it also affords an opportunity for an additional chapter on "the Canary," which ought not to be deferred an instant, seeing that the breeding season with these interesting little creatures has now fully commenced.

It will be borne in mind, that I have already spoken at length of nightingales' cages; and also of their proper food. These being the principal requisites to be immediately known, what has to follow will be in ample time for my readers' further consideration. The *resumé* will be given in a little week.

It appears that our familiar and popular treatises on the Canary-finch have excited no little attention, both far and near,—causing those who have never yet kept these birds to commence doing so; and those who have already kept them, to increase their stock, and study still further the peculiarities of the race. This is well; it is indeed a result which I have laboured kindly to see effected.

Among other places where our fame has extended, is that sweet, lovely, picturesque spot—Welling, in Kent, situate some dozen miles from our Modern Babylon. Here lives, in delightful seclusion, Henry Wollaston, Esq.—a most remarkable gentleman amateur in the matter of canaries, rearing them in a manner which, when explained, will be indeed thought worthy to be called "remarkable."

A friend of Mr. Wollaston, residing also in the village of Welling, and a subscriber to the *Gardeners' Chronicle*, recently asked the last-named gentleman if he ever perused that Paper? and at the same time, being answered in the negative, directed his attention to the papers contained therein on the "canary." These, it seems, so played upon the fancy of Mr. Wollaston, that a most kind and special "invite" was the immediate consequence. The delicacy of the invitation was worthy of the giver of it; for the "pleasure" asked "of a visit from *me*" ought to have been rendered *vice versâ*. Indeed, I left Welling, surprised, amazed, and exceedingly delighted. It would occupy too much space, were I to detail my journey, and say how, on one truly lovely morning this week, I went down to Abbey Wood,—the rail conveying me swiftly and pleasingly away from our murky, filthy city, and depositing me safely at my first place of destination. Nor need I do more than glance at the happy repose and universal rejoicing of all nature, as

the omnibus, which met the train, travelled leisurely onwards towards Welling, through the prettiest of pretty scenery—wood, landscape, and dell, with murmuring rivulets meandering musically along on every side. These "summer" feelings, we all know, are indescribable: they rejoice the heart; they refresh the spirit.

After travelling some two miles, I descended near the turnpike-gate,—the side road from which, to the left, leads to Bexley and Footscray. I then took the main road, to the right, and found myself speedily at the entrance of the village of Welling. My escort all the way thither, was by nightingales, blackcaps, robins, skylarks, whitethroats, and pettychaps. Here I was met, *vis à vis*, by the founder of the feast, the owner of the mansion,—who, asking my name, or indeed pronouncing it for me (for my face "looked" it), at once conducted me, with the blandest of smiles and unmistakeable cordiality, to his fairy seat.

I have been thus minute in my description, for two reasons. One is, that the imagination of my readers may be directed to the BEAUTY of the spot where canaries breed *in the open air, and in a state of perfect freedom;* the other is, with a view to indicate the precise *locus in quo* of Mr. Wollaston's picturesque abode, should any visitor, curious as myself, ask permission of that gentleman to take a peep at his little world of living wonders. On entering Mr. Wollaston's mansion, I was struck by the extensive and charming view from the window. Seated, or rather embosomed in its own grounds, from the windows, downwards, there is a verdant lawn, extending, by a gradual slope, as far as to the very margin of a large open park—the whole being *one spacious domain*, with no single interruption to the unbounded prospect.

Immediately contiguous to the dwelling-house is an ample shrubbery, beautifully laid out on every side, and comprising dwarf and tall trees of nearly every kind. To the left, immediately beyond the flower-garden, and in a shady corner, is a sheet of water; the trees overhanging which, cause the whole to have a very picturesque effect. Let me add, briefly, that this romantic spot is "peopled" by canaries of all hues, flying about in the full enjoyment of uncontrolled liberty, building their nests in every imaginable enticing spot, and feeding their young ones immediately under your eye; using all the familiarity of welcome guests, which they really are. To describe the effect produced by this pretty, this unusual sight, were impossible. The forms of the birds, their square and forked tails, peculiarity of flight, and other hitherto unrecognised habits, were alike remarkable; indeed the scene altogether is far beyond the power of my pen to describe.

Nor are the garden, park, and shrubberies tenanted by canaries only. There are, in addition, the usual number of nightingales, blackbirds, thrushes, robins, and other tribes—*all* domesticated here. Such a union of happy voices was scarcely ever before listened to. The musical powers of the canary, heard in an open field, park, wood, or garden, are as novel as they are beautiful. When thus free, this bird is heard to perfection; for he, like every other bird in confinement, feels under some degree of restraint, and sings as much from habit, in a cage, as from any other motive. Not so, when at liberty. During my stay, I examined everything; I pried into all the nests, and counted the eggs. Also took a peep at the young callow nestlings, in the trees; some of them only recently clad with the shell of the egg. Then I whistled to the sitting mothers, and industrious papas, busily engaged in search of food for their offspring. This, and all other convenient luxuries, are placed in a large cage at the lower end of the lawn, with a private door of entrance and exit, made so as to open or close at a minute's notice. This is an admirable contrivance.

In the greenhouse, on one side of the dwelling house, a large, deep, and comparatively-narrow cage, fitted up with perches, &c., is erected, close to the side window. At the top, outside, is a small opening, like the entrance to a bee-hive, but of course larger. Immediately opposite, and parallel with this, the branch or stem of a tree has been trained from the wall. This acts as a perch. The roaming birds, when they wish to enter, alight here, and go in and out *ad libitum*. It was built for their use, in case of any sudden inclement weather coming on; and is now and then used by the birds as a temporary resort under such circumstances. Young and tender nestlings or invalids, too, find this a convenient domicile; their parents coming in to and tending them with all the affection so peculiarly their own.

Mr. Wollaston is a man of method withal. His birds represent the alphabet. Thus, we have Mr. and Mrs. A., Mr. and Mrs. B., &c. &c. We also find a note in the "Book of Family Annals," that Mr. A. was bred in a Magnolia; Mrs. B. in a Larch; Miss D. in a Wistaria; and Master F. in the lofty Plum tree, &c. We observe, too, entered in the same note-book, ages, birthdays, and other memorable days in the calendar.

Then we have stratagems, and plans innumerable, artistic, and admirable, for the capture of any bird at will. He enters. His departure is prevented by an invisible string, closing his place of entrance! A long stick, mysteriously and suddenly introduced, causes him to escape from the top of the large cage into a narrow store-cage annexed; beyond which is yet *another* store-cage—all communicating. The doors are then all magically closed. Unseen pulleys let the cages descend; and what would occupy a novice a whole week, is here prettily accomplished in two short minutes. This, and very much more; which space forbids me to enter upon. The object of this chapter is to show, that as Mr. Wollaston has for three whole years kept canaries constantly in his garden and shrubberies, there can be no practical difficulty in our doing the same thing. These birds are now quite "hardy," and might easily be trained to live anywhere. As to their beauty, when trotting along upon the Grass, or flitting across the lawn, or mounting upwards to a tree,—the sight is charming beyond all conception.

One word more. From certain minute and interested remarks I made, while at Welling, I am so impressed with the novelty, as well as "prettiness" and practicability of peopling our gardens with these birds of variegated plumage, that I shall turn my serious attention to the subject. Mr. Wollaston has originated an excellent idea, and fully perfected the "principle" of it. I shall take out a patent for an "improvement" on the same, and hope to introduce quite a new era in the "decoration" of our suburban gardens. In this matter, I feel sure my new friend will most readily assist me. I read it in his generous countenance, and consider my wishes as already complied with. *William Kidd, Newroad, Hammersmith.*

## Home Correspondence.

*Deodars.*—Doubting the correctness of the conclusion arrived at by "An Old Sawyer" as regards the stuntedness of some Deodars, and having had considerable experience in the management of Conifers myself, I beg to offer the following remarks. As Deodars, either in the shape of single specimens or groups, are well calculated to enrich our landscapes, every means of producing plants speedily deserve to be fully made known. I have found the Deodar, raised from cuttings and grafts, to grow equally vigorous and symmetrical with seedlings. In cultivating this plant, I have derived great advantage from inarching it upon the Spruce Fir, 5 and 6 feet high from the ground, and when this is performed upon strong healthy stocks the growth is very rapid. I have some trees which were worked in this way seven years ago, now 15 feet high, and 12 feet in diameter of branches, the latter nearly reaching the ground. I have also found it to succeed equally well on the Silver Fir, but not so satisfactorily on the Scotch and Larch Firs; it will live on the latter for a year or two, but it soon becomes sickly and dies off, unless it is worked very low, and tongued as soon as the union is safe, so as to induce the Deodar to root from the graft, which it will do readily; and under such circumstances the plant will grow vigorously. I have seen numerous instances of young branches at the top of these trees forming themselves into leaders, and sometimes very long branches will assume that character, clearly showing that a branch possesses the capability of adapting itself to the position; and whoever will examine plantations of Conifers will find other kinds doing the same thing. In fact, I frequently find them possessing this tendency rather too much, and therefore, I am oftentimes obliged to cut off or tie down rival leaders, in order to preserve a handsome form of tree. As regards "dormancy" in the leaders of Deodars and other Pinuses too, I find it frequently to occur in them at about 3 or 4 feet high, owing to some cause, the nature of which I have never been rightly able to discover; but I am inclined to attribute the evil to some peculiar influence acting upon the vitality of the plant, causing an early development of the leader-bud, before our late spring frosts are over; and when the leader-bud is in that delicate state, the slightest frost either totally destroys it, or injures it to that extent that it is unable to push during the following summer, and sometimes not even in the succeeding one. During this time the stem of the plant greatly enlarges, apparently concentrating its energies in order to form a new leader; which, in course of time, bursts forth with extraordinary vigour; and, if not again injured, soon overtakes its more fortunate brethren, and nothing is lost in the end. I would advise those who have Deodars, or other Conifers, in this stunted condition, to shorten the side branches, as I have found this practice to greatly accelerate the pushing of a new leader. One of the stronger branches may also be tied up to an upright stake; this will shortly become as handsome a leader as could be desired; but, at the same time, the tree should have a good surface dressing of stable manure. It is the form which the branch takes that alters its character from the leader, and not any difference in its organisation; both are capable of the same change or variation, and if you vary their form you alter their character—*i. e.*, a leader will become truly a branch, if tied down; and a branch will as easily become a leader, if tied up. *Adscriptus Coniferis.*

*Botanical Names.*—I think that the endeavour to Anglicise the Latin names of plants is a mistake, and is palpable enough in reading your report of the Horticultural Society's Exhibition, viz., in the list there come, "The Baxter Leschenault, the Java Ixora, the Cels Hovea." Now these words do not convey to one's mind such a clear idea of the meaning of the names as would L. Baxteri, I. Javanensis, Hovea Celsi, from which it is apparent at once that the first and last plants take their names from their discoverer or some botanical worthy, the one in the middle from its native country. Then afterward there occurs "the noble Dendrobe, the lovely Phalænopsis." Now, one unacquainted with the plants would not be aware that these two adjectives are the distinctive names of the particular Dendrobe and Phalænopsis, but would take them to be merely the expression of your reporter's admiration of the plants. It would be otherwise if they were called, as of old, D. nobile, P. amabilis. So also, if I found a new Heath and called it "Erica Loudoni," most people would know after whom I named it; otherwise, it called the Loudon E., some might think it was the production of Loudon Hill. I must say I admire the Latin as the neatest nomenclature. *G. R. T.*

*Coppice Woods.*—A person who is alive to the advantages accruing from a judicious management of coppices, cannot travel 10 miles in any direction without having to lament the miserably neglected state of such woods, from the time the copses are cut down to the time they are in a fit state for the next fall; there is no care bestowed on them, they are left to nature, every shoot is permitted to grow, producing little else than brushwood. Whereas, if the shoots on each stool were singled out, properly thinned, and judiciously pruned, their growth would be greatly accelerated, and the value of the crop much enhanced. All the kinds of wood applicable for hoops, hurdles, and wattling purposes, would be fit for use in half the time that neglected copses require; and all the larger growing sorts, used for Hop-poles, and other purposes, would be in a proper state for being cut down one-third sooner than the time allowed between the times of cutting, under the present neglected mode of culture. The old routine practice goes on from one generation to another; no new or more profitable modes of applying the produce of coppice-wood are ever thought of. Although the way of manufacturing pyroligneous acid has been known more than 30 years, yet, strange to say, few or none of the woodland proprietors have availed themselves of that knowledge. One ton of wood produces 80 gallons of the condensed liquor. The acid is used by bleachers and calico printers, for making white lead and the sugar of lead, as well as by chemists, for making a superior transparent domestic vinegar. Pyroligneous acid is the most powerful antiseptic known; all sorts of wood, excepting those of the Pine or Fir tribes, answer the purpose. Spray or brushwood may be used, or billets of size fit for charcoal, round or square, not more than three inches in diameter. The charcoal produced is of the best quality, fit for every chemical or domestic purpose. It may be proved that no crop will pay better for good culture than a crop of wood. *J. D.*

*European Orchids.*—Little attention appears to have been bestowed on the cultivation of the terrestrial Orchidaceous plants of Sicily and other parts of the south of Europe, Algiers, &c., many of which are very curious, and some are very beautiful. I saw two large pots of one in flower at Mr. Hanbury's at the Poles, Herts, O. unicornu, I believe; and at the gardens of the Luxembourg I saw three or four kinds in flower, which were handsome, one or two marked Algiers. Have any of your correspondents any experience in the cultivation of these plants? What are the best kinds to grow for ornament, and from whence are they to be procured?—I presume at Palermo some may be obtained, and I believe at Florence, also, some of the more showy may be found. *Dodman.*

*The Cuckoo.*—One of your correspondents has lately favoured us with some remarks about the cuckoo, so similar, to what was current in the time of Aristotle, that the coincidence is rather remarkable. I happened to stumble on the passage a few days ago, and send you a translation, if you think it worth noticing. It is taken from the sixth chapter of his sixth book of Natural History:—"The cuckoo is said by some to change from a hawk, because, about the time of the cuckoo's appearance, that kind of hawk which it resembles disappears; but scarcely any hawk is to be seen except for a very few days after the cuckoo has begun to sing. The cuckoo is seen for a short time in summer, but disappears in winter. The hawk has talons on its feet, the cuckoo has not, neither is a cuckoo's head like that of a hawk; but in both these respects it rather resembles the dove, and is like the hawk only in colour—the markings, however, of the hawk are somewhat like lines, those of the cuckoo like spots. In size and flight it very much resembles the smallest hawk, which is seldom to be seen at the same time with the cuckoo. But when both have been seen together, the hawk has been seen to eat the cuckoo, though birds of the same kind never act so to one another."—*Aristotle*, Περὶ Ζῳῶν. Z. G. [We are unable to discover to what former communication our correspondent refers.]

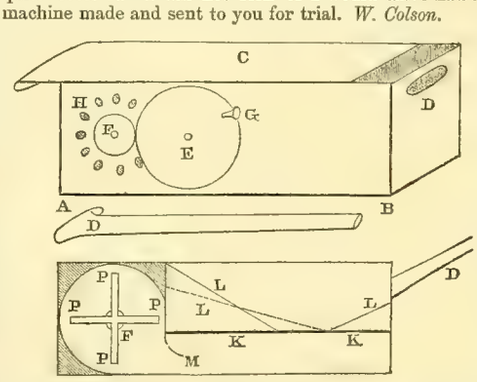
*Covering Wall Trees in Spring.*—A few weeks ago, some of your correspondents strongly advised the covering of trees, especially Apricots, &c., with mats, canvas, or other covering, consequently I purchased a quantity of canvas at 3*d.* per yard—I mention the price, to show that it was light canvas; with this material I covered many of my trees, placing some branches of the Yew and Fir, to prevent the blossoms being knocked off by the vibration of the canvas if disturbed by the wind. I had a very good show of blossoms when covered; and last week we uncovered them, but none of the flowers have set, not upon an average two to a tree. The Plums we did not cover have set; the Pears that were covered have set. I name this for the benefit of your correspondents; and if convenient, I should like to hear of the probable cause of this total failure on the Peach and Apricot. *A Constant Reader, Teddington.* — I endeavoured to screen my Pears, Apricots, &c., this spring, but not having apparatus for raising and lowering the screens at pleasure, I fear I have only made the blossoms blind, though the canvas I had was open in texture, and I kept it well away from the wall, so as to admit the air to circulate. I wish to know whether cotton netting of ½ or ¼ inch mesh would be liable to the same objection, or whether even inch meshed woollen netting would preserve the trees; and further, whether dipping such netting in a solution of corrosive sublimate would add much to its

durability, for, strange to say, I have no tan pit within 20 miles of me. *G. R. T.*

*The Chrysanthemum.*—I do not doubt the correctness of Mr. Coombs's statement when he says all who have seen his neighbour's Chrysanthemums have admired them; but this fact by no means proves their superiority, as it is just possible that those who have seen Mr. Ivory's plants have not seen the productions of the metropolitan growers. As Mr. C. is of opinion, however, that his neighbour's Chrysanthemums are superior to those of the latter, with the view of testing the correctness of that opinion, I beg to say that I shall be most happy to show plants or blooms with him, either in town or any reasonable distance in the country. *B. James, Stoke Newington.*

*Iris Susiana* (*Death's-head Iris*).—How rarely this is well grown in this country, and not often flowered. I saw, a few days since, in the gardens of the Luxembourg, at Paris, large patches of it grown in a cold frame; there were 10 or 12 flowers (half as large again as any I ever saw in this country) open at the same time; the plants appeared to be growing in very light soil. I shall try this mode of cultivating this interesting plant, and recommend your readers to do the same. The roots are to be bought with the other Dutch roots in the autumn; but I suspect that those usually purchased have been too long out of the ground, or have been taken up too early; and that this is probably the reason they do not often succeed. *Dodman.*

*Ridge and Furrow Roofs.*—In your notice of the Royal Nursery, Slough, you remark there is "a square conservatory, with a ridge and furrow roof, on Mr. Paxton's principle," &c. &c. Permit me to say that it was made by me, and is a copy of one I presented to the Horticultural Society in May, 1846, and which was then erected in Chiswick Gardens. If you can find space to publish the letter that accompanied the presentation, your readers could then judge who has the better title to originality for this principle of construction; and, also, who first introduced it to the public. I have failed in tracing the erection of flat ridge and furrow roofs, without lap joints, to an earlier date. *James Hartley, Wear Glass Works, Sunderland, May* 13. The following is the letter alluded to:—



"To the Committee of the Horticultural Society, Chiswick.—Gentlemen—In consequence of the numberless applications received by me for information as to the expense of erecting conservatories, I have been induced to design and execute a sort of model conservatory, and which, with your permission, I shall be happy to erect in the gardens at Chiswick, if you will be kind enough to accept it, presuming that the information connected with the construction thereof, is within scope of the objects of your Society. My intentions are to show that the erection of a conservatory is far from being so expensive an affair as is generally supposed, and have, therefore, adopted a new principle of construction, as being more economical. At the same time, it will be found more substantial, and suitable for horticultural purposes, than the ordinary method, whilst it will be an ornament in any part of a garden or pleasure-ground. My design will, no doubt, appear crude. I only profess, however, to point out a more economical application of the materials employed in the construction of conservatories, not doubting that the idea will be worked out and perfected by more competent parties. I send herewith a model of my design; if you approve of it, and grant permission for its erection, it shall be done forthwith; and when completed, I shall be happy to give full particulars as to the cost, and the proportionate sums for larger or smaller sizes, when I hope to show that a conservatory can be erected for less money in England than upon any part of the Continent. The model is upon a scale of 1 inch to the foot, the full size being 36 feet square; the ridges are formed of single squares, so that there will not be a lap joint in the building. I remain, gentlemen, yours very respectfully,
(Signed) "James Hartley."

*Calceolarias.*—My attention having been drawn to "M. P.'s" article on the Calceolaria, and also to Mr. Rumley's comments thereon, I am induced to offer a few words on the subject. I consider that the remarks of "M. P." and Mr. R. apply only to certain localities. "M. P." perhaps in his locality, like others in less favoured spots than that of Mr. R., may find the impossibility, or nearly so, of raising plants of chosen form and colour from cuttings, as Mr. R. absolutely demands; and Mr. R., on the contrary, having local circumstances in his favour, may find it best to raise his stock in that way, but I presume if he had gained his information in other places than that of the north of England or Scotland, he would have given some other method than that of raising Calceolarias solely from cuttings; and "M. P.," on the contrary, would gladly have availed himself of Mr. R's injunctions. I agree with "M. P." in objecting to Mr. R's dangerous system of keeping saucers filled with liquid manure, or other liquid under the plant, my own experience having taught me that a superfluity of moisture, either at the roots or in the house, induces a contagious disease, which, though apparently unknown to Mr. R., all the skill of the most eminent cultivators has as yet been unable to eradicate. *G. H.*

*Aquatics.*—You inform a correspondent that Calla, Caladium, and Nymphæa cœrulea "require to be removed in winter." But these species are usually raised in pots. You cannot surely mean that the pot-ball cannot be turned out of the pot, and placed in a basket for submersion, while in a growing state? Is the Aponogeton duck-proof? Something has cropped off all the foliage of mine, and I believe it is my ducks. *A. H.* [We don't know about Aponogeton. What we meant by removing Nymphæas, &c., was to remove them to sheltered places, so as to secure them against winter cold.]

*Seeds.*—Having occasion for a few varieties of the commoner annuals, I went into a seed shop to-day, not quite a thousand miles from Exeter, and desired to have two pennyworth of each of six kinds of annuals got ready for me, and I would call as I returned for them. On calling the shopman said, "We do not usually make so little as two pennyworth of ——. You will find very little, but we did it to please you." I said I was obliged; and returning opened the paper and weighed the seeds. They weighed exactly six-eighths of a grain, upright weight, troy. Take them as one grain, at 2*d.*; that is 10*s.* per dram: equal to four sovereigns per oz. A tolerable scale of profit in these free trade times. *P., Exeter, May* 12.

*Fumigators.*—I send you a drawing of a plan I have had adopted here, by which we fumigate our largest greenhouses with the greatest success. We find "Brown's Patent" a very nice little machine for small houses and frames, but it does not produce a sufficient volume of smoke to do the work quickly or with effect; for as there is always an escape, the smoke must be quickly supplied to fill the house all over alike. I have, therefore, turned my attention to the production of a larger and quicker consumption of the tobacco, by means of a larger and more powerful machine. I am afraid that the plan will give but a bad idea of my scheme, but it will be seen that as the amount of tobacco spread out may be limited to an ounce or extended to a pound by means of the regulator, the consumption will, in both cases, be economical and effectual. The tobacco is to be placed on a little pile of ignited wood, or set alight by means of a little touch-paper, and the supply of smoke can of course be regulated by the amount of draft given by the wheel going round slow or quick. The machine can of course, like "Brown's Patent," be used from the outside of the house. We have used it now about six times, and we are perfectly satisfied with it. The smoke is not hot, as traversing through a long pipe (15 inches) quite cools it. I am not rich or I would have had a machine made and sent to you for trial. *W. Colson.*

*Section.*

*Description of Woodcut.*—The wheels are leathered all round, which causes them to act as with cogs. A small spring (unseen) draws the two wheels together. A, B, a box made of galvanised sheet iron, 18 inches long, 7 inches wide, and 8 inches deep, with a moveable smoke tight lid, C; and D, a smoke pipe, riveted on the box at D. E is the larger wheel (G the handle), moving the small one, F, on the axle of which is a fan with four blowers, P P; M, the draft aperture; K K is the grate, made of strong woven wire, about ½ inch mesh; H, holes to supply air to the fan; L are sheets of iron to contract the area of the furnace grate, as may be required to suit one ounce or a pound of tobacco.

*Hyde Park.*—Since the three or four old trees, enclosed within the building of the Great Exhibition, were considered by the legislative body of Great Britain of sufficient importance to be made a subject of debate, I trust I shall not be considered as needlessly encroaching upon your time by drawing your attention to two abuses that are now in no small degree contributing to the injury and disfigurement of Hyde Park. The abuse first to be animadverted upon (inasmuch as it is committed by that very class of society to which the orators belong who stepped forward as the champions of the community at large) is, the unfeeling galloping over, and cutting up of, the fine piece of Grass on the slope between the Serpentine and the Crystal Palace, one of the most beautiful features of the noble park, which a fortnight ago might have vied in beauty with any lawn in England. Now, these equestrians (equites, or equestres) should remember that they form but a very small portion of that community whose privileges were so eloquently defended by themselves in the senate, and that while they are thus luxuriating on the soft Grass, they are depriving the larger portion of their fellow-citizens of the quiet enjoyment of one of their favourite resorts, and destroying the very place for which they evinced so much interest. The other abuse is, allowing nuisances of all sorts to be committed round the trees near the Crystal Palace; this has been the case during the whole period of the erecting of the building, and if allowed to go on, will (I am sure you will admit) endanger the existence of those trees, some of which are among the finest of the park. The evil might, I think, be avoided by putting up proper places near the Exhibition. Such places are very much wanted throughout the metropolis, and the want of them, every medical man will admit, is the cause of many serious disorders. *A Constant Reader.*

*Chiswick Exhibition.*—In the list of awards advertised in your last Number, I notice two errors. A Silver Knightian Medal is stated to have been given for Cinerarias in 6-inch pots, and a Silver Banksian for Cinerarias, also in 6-inch pots, but the fact is that both collections were produced in 8-inch pots; and the collection of Messrs. Lane was disqualified for containing plants in other sized pots. *Censor.*

*Cloth of Gold Rose.*—Perhaps it may be interesting to growers of Roses to know that the Cloth of Gold blooms in the highest perfection out of doors in the Isle of Wight. I have now a tree of this kind on a south wall in flower, and one of its beautiful Roses measures full 5 inches in diameter. This specimen has not been planted out more than 2 years. Devoniensis also succeeds perfectly out of doors. I have a bloom at this moment in my greenhouse, measuring 4½ inches in diameter, growing upon a very small plant. *Edward Dames, St. Helen's House, Isle of Wight.*

*Penny Banks.*—In your paper of May 3d, "A Gardener's Boy" asks for information respecting penny banks. There has been one established here by the rector of the village in which I reside, and it is working very well indeed. It is really surprising what has been saved by the children who have joined this "penny save, penny get club," in putting their pence by, instead of spending them in lollylops and other worthless trash. As I keep the accounts I am prepared and willing to give any information respecting it that may be required. *Wm Griffin, Eydon, Daventry.*

*Ceanothuses.*—Among the many recent introductions of hardy plants into our gardens, there are none perhaps more effective or better adapted for covering walls than the Ceanothuses. We have here (Osborne) fine specimens of the following, which were planted on a south wall in the spring of 1848, and withstood the severity of the winter of 1849 without protection, uninjured—viz., C. dentatus, C. papillosus, C. rigidus, C. cuneatus, and C. sp. California. I beg to offer a few remarks on the mode of culture as practised here—1st, C. dentatus: I consider this to be the most beautiful of them all; the extreme neatness of its foliage, the beauty and profusion of its flowers, cannot fail to render it an object of universal admiration. Our plant, which is 6 feet 9 inches in height, is now coming into bloom; it is trained on the horizontal system; the extent of its branches at the bottom is 9 feet 6 inches, gradually decreasing to the point of the main stem. After it has done flowering we shorten back the secondary branches to within an inch or so of the main laterals; this we repeat two or three times in the course of the season, according to the growth they make. It may be well to mention that the last pruning must not be performed too late, as on these branches we depend for the principal supply of flowers in the following season. This plant matured seeds last season, which were sown early this spring, and the plants are now coming through the soil.—2d, C. papillosus: I consider this next in superiority; it will endure similar treatment to the former, but it is more vigorous in its growth—a great acquisition in a wall plant. Our specimen, which is just coming into bloom, is 9 feet in height and 10 feet in extent of branches at the bottom, gradually diminishing to the summit. Seeds of this also ripened last year, and are in the same stage as those just mentioned.—3d, C. sp. from California: This is more vigorous in its growth than papillosus; it produces laterals freely, but not secondary branches. Our plant, which is 13 feet in height and 11 feet in extent of branches at the bottom, has not flowered with us yet.—4th, C. rigidus: This is a charming species. Our plant, which is 6 feet 9 inches in height, and in extent of branches 8 feet 6 inches, has been a dense mass of bloom, the beauty of which is now past. It does not produce laterals so freely as the other species, nor does it show any disposition to produce seeds, though it has flowered two seasons.—5th, C. cuneatus: This has not flowered with us at present, consequently we cannot say much respecting it, but its appearance is very promising. This plant is 7 feet in height and 8 feet in extent of branches at the bottom. In its growth it is similar to rigidus and sp. from California. *C. Winchester, Osborne Gardens.*

*Cucumbers.*—My plants having been unusually luxuriant this year, perhaps some account of the way in which they have been treated may be acceptable. The pit in which I grow my early fruit is heated by hot water on the tank system; the soil I use consists of three parts Wimbledon loam, one part well rotted dung, with a portion of half decayed leaves and charcoal, the latter in the proportion of 1 to 10 of the whole mass. I also put 4 inches of charcoal in the bottom of the bed, so as to ensure good drainage and to allow hot air to ascend freely from the tanks. The soil is turned over once or twice, in order to mix the whole well together. The loam should be mellow and in a rough state. I grow the young plants in decayed leaf-soil, until such time as they are fit to be planted out. Only a little charcoal is used in the bottom of the pots, in order that there may be nothing to abstract at planting out time. Due attention must be paid to stopping and training. I always stop when the plants have made two leaves about the size of my thumb; the second time I stop at the third or fourth joint, according to the strength of the plant. In this way I insure strong fruit bearing wood, with the centre of the bed well furnished. I water liberally during the period of growth. The temperature of the water should be equal to that of the pit in which the plants are. Plenty of air should be admitted on all favourable opportunities. I would, however, recommend an old mat to be placed across where the air is admitted, in order to prevent the ingress of sharp cutting winds. With regard to heat, that should be kept steady; I maintain 80° at bottom, with a top heat at night of from 68° to 70°, and 75° to 80° through the day. Under the above treatment I have this season grown Cuthill's Black Spine, the improved Sion House, and a White Spine, in one pit with uniform success. *John Kenny, gardener to the Earl of Cottenham, at Copse Hill.* [The fruit we received was one of the finest and best grown that we have ever seen.]

*A Garden Anomaly.*—"My Potato ground is so loose, that I can push my arm quite under their roots, and poke my fingers through the soil on the other side," wrote somebody in a garden periodical, within a short stretch of recollection; and he added to the effect, that such a condition was what he considered the *acme* of good cultivation. A modification of such a "loose character," may possibly approximate to what is generally considered a good condition of soil for growing crops; at all events, no one, careful of his reputation as a good gardener, would risk the assertion, that constantly stirring the soil about the majority of growing crops, was not beneficial. Both practice and theory seem alike in favour of it. All authorities recommend it. First-rate gardeners to a man preach from the text incessantly. But there are two sides to every question, and the advocates of either, no matter what may be the subject, are enabled to find matter for foundation to their argument. I am not about to deny the efficacy of soil stirring, far from it. Every day do I see examples of its efficacy. But there are two or three matters so apparently contradictory, that I must beg leave to bring them into notice. Not because they are not patent enough, for every one with half an eye must have noticed them often. If you go through a Wheat field by the beaten foot-way in spring, you will notice that all the plants growing in the hardened soil of the path are more robust, of a richer green colour, and infinitely more "tillered" than those in the ordinary ridges. I shall be met here by the assertion that it is because those plants are on the outside of their neighbours, receive a larger quantum of light and air, and are not pressed upon by their fellows. I deny that this argument is conclusive. Select single plants in any other part of the field, all circumstances being similar, without the consolidated soil, and if the plants exhibit all the favourable characteristics of those on the borders of the foot-way, I yield my position. They will not be found to answer. If a Carrot or an Onion, or any other plant, is allowed to spring up or grow in the hardened "alleys" of the gardeners' seed-beds, the same phenomena will be exhibited as in the Wheat field; and I know the same argument will be opposed as antagonistic. But they will ever be found, when fully investigated, to be faulty. Plants, about the roots of which the soil has become loose, from the frosts of winter, or other causes, soon become sickly, and of an opposite condition, is not speedily effected, the plants, in the majority of instances, die, or become so stunted, as to be worthless. The advice of a gardener I was acquainted with, of no mean pretensions, if the condition of his crops may be considered as conclusive evidence, was "keep the soil consolidated above the roots of your growing crops. Never let a weed gain a footing, but do not loosen the soil." In his garden I know that all the conditions aimed at and effected by those of opposite views were realised. I do not record the cursory observations without having given both sides of the question their due consideration, nor without the knowledge that to insist on the preference of a consolidated soil, when compared with one of an opposite condition, is to lay myself open to ridicule. But these are anomalies, real or apparent, in the present question, and I should like to see them reconciled. *G. L.*

## Societies.

Royal Botanic, Regent's Park, *May* 14.—This Society was fortunate in having a dry day, though cold, for its first *fête* this season. Without anything very striking, if we except the Roses in pots, which were again produced in great beauty, the show may be said to have been a good one. It was inspected by the Queen and H.R.H. Prince Albert a short time previous to the admission of the public. Falling as it did so soon after the Chiswick meeting, it was largely composed of plants exhibited there; and as these have been fully described last week, we shall confine our remarks in the following report to such subjects as were not shown on that occasion.

In the fine collection of 30 Stove and Greenhouse Plants furnished by Mr. May, gr. to Mrs. Lawrence, of Ealing Park, we remarked a pretty example of Hovea pungens, a plant which few grow well; Gomphol obium polymorphum, beautifully flowered, in the form of a small bush, in which shape it looks much handsomer than trained on a trellis; a splendid specimen of the graceful Bossiæa disticha plumosa, measuring at least 4 feet high and as much through; and a very fine bush of the Henchman Chorozema.—The second collection in point of merit came from Mr. Cole, gr. to H. Colyer, Esq.; and third and fourth groups were contributed by Mr. Stanly, gr. to H. Berens, Esq., and Messrs. Pamplin, of Lea-bridge.

Collections of 20 Stove and Greenhouse Plants were exhibited by Messrs. Green, Taylor, and Fraser. The former had yellow and purple Azaleas, the blue Leschenault, the rosy-flowered Adenandra fragrans, two Everlastings, Pimelea spectabilis, and a neat Boronia pinnata, which still ranks among the best species of the genus. Mr. Taylor sent a group of well grown plants, among which were the useful Ixora crocata, a large plant of the Box-leaved Eriostemon, a white Azalea, two Polygalas, a handsome bush of Adenandra speciosa, and Dracophyllum gracile, a plant whose neat spikes of sweet smelling white blossoms answer well for bouquets. Messrs. Fraser had a brilliant example of Azalea refulgens, a pyramidal Eriostemon neriifolium, the blue Leschenault, Boronia pinnata, and a pretty little Pimelea spectabilis.

The best collection of 10 Stove and Greenhouse Plants was produced by Mr. Croxford. We remarked in this beautiful specimens of Epacris miniata and Pimelea Hendersoni, which, when well grown, is a very gay and really useful greenhouse shrub. Mr. Speed's plants, which were fresh and beautiful in the morning, suffered much from cold in the course of the day, and before evening arrived, had drooped considerably. Other collections also exhibited the ill effects of a cold wind, sweeping through the tents. Mr. Williams, gr. to Miss Traill, sent the broad-leaved Bossiæa, the charming Erica propendens, Pimelea Hendersoni, an Everlasting, the beautiful violet Tetratheca verticillata, some Azaleas and Cape Heaths. Other collections of 10 stove and greenhouse plants were furnished by Mr. Carson, Mr. Barnes, Mr. Hamp, Mr. Watson Mr. Norris, and Mr. Slowe. In Mr. Hamp's group we remarked the Fortune Gardenia with snowy flowers, large and sweet, a considerable improvement on those of the old fashioned G. florida.

Orchids.—There was a large bank of this interesting tribe of plants, which always seem to excite more attention than any other kind of flower. We did not recognise among them, however, much different from what was shown at Chiswick. In Mr. Mylam's excellent exhibition of 25 plants were Lycaste tyrianthina, in good condition; a splendid bush of the Purple Camarote, which was, however, unfortunately insufficiently in blossom; a fine Dendrobium nobile and Saccolabium præmorsum.—Mr. Williams had the beautiful Lælia cinnabarina, whose charming colour was approached, but not equalled, by that of the Orange Epidendrum, the small yellow Dendrobium Jenkinsi, the white-lipped Zygopetalum rostratum, and the larger variety of Dendrobium Pierardi.—Collections of 15 and 10 plants were numerous, and we remarked a noble Cattleya Mossiæ, shown as a single specimen, from Messrs. Veitch. This could scarcely have had less than from 20 to 30 glorious flowers on it, all in the highest state of perfection.—Rarities consisted of Ornithochilus striatulus, from Mr. Carson; the Henshall Bolbophyl, a creamy yellow species, from Messrs. Rollisson; and Trichopilia coccinea and an Epidendrum from Mrs. Lawrence.

Azaleas, although in some instances fine, had in general lost much of the brilliancy which they possessed at Chiswick. Mrs. Lawrence's Chinese Yellow, was, however, just in perfection, and a finer plant it would have been difficult to discover. Some of her other specimens were also excellent, as were likewise Messrs. Fraser's.

Roses in Pots formed the grand feature of the show—sweet, large, and beautiful. Messrs. Lane's collection, which was first, was uncommonly fine. Their Coupe d'Hébé was a mass of flowers, rich in colour and regular in form. Mr. Francis too, had the same variety in beautiful condition, as had also Messrs. Paul. Indeed few Roses are more handsome or useful than this fine kind. Among other varieties we noticed Louis Bonaparte, Miellez, Baronne Prevost, Géant des Batailles, Souvenir de la Malmaison, Duchess of Sutherland, Vicomtesse des Cases, Devoniensis, Blairii No. 2, Pauline Plantier, Paul Perras, Armosa, Augustine Mouchelet, Elise Sauvage, Goubault, Niphetos, William Jesse, Mansais, Madeleine, La Reine, Bougère, and Aubernon. In the Amateurs' Class, Messrs. Terry, Williams, Roser, Rowland, and Chitty, had beautifully managed plants, more especially Mr. Terry's. The foliage was clean and healthy, and the blooms numerous and well blown. Dr. Marx, Persian yellow, Lamarque, Las Cases, Mrs. Bosanquet, Bouquet de Flore, Bourbon Queen, Bardon, Tagliori, Fabvier, Odorata, Comtesse de Lacépède, and Madame Legras, were remarkable for beauty and profusion of bloom. Mr. Francis had a box full of Géant des Batailles, "worked" plants in 3-inch pots, each having a single stem about a foot high, with a brilliant crimson or rather scarlet flower on its summit. These excited much interest, as well they might, for such plants will doubtless be found very useful for many purposes for which large specimens would be worthless.

Cape Heaths were numerous, and for the most part well bloomed. Splendid plants were produced by Messrs. Smith, Cole, Rollisson, Veitch, and others. Among the different varieties, were aristata major, Beaumontiana, Westphalingia, ventricosa coccinea minor, tortiliflora, suaveolens, Cavendishii, Favoides and its purple variety, Macnabiana, mutabilis, ampullacea, Sprengeli, hybrida, florida, intermedia, ventricosa carnea, fastigiata lutescens, perspicua nana, metulæflora, odora rosæ, and Hartnelli.

The best Single Specimens consisted of the Cattleya already alluded to, from Messrs. Veitch; a huge Pimelea spectabilis and Boronia serrulata from Mr. May, gr. to Mrs. Lawrence; Erica perspicua nana, from Mr. Smith, gr. to W. Quilter, Esq.; Epacris grandiflora, from Messrs. Fraser; and Leschenaultia formosa, from Mr. May, gr. to Miss Traill.

New Plants.—In addition to those produced at Chiswick, Messrs. Veitch had Pimelea Verschaffeltiana, Messrs. Henderson Ceanothus papillosus and rigidus, and Franciscea confertiflora, a promising violet-flowered species; the sulphur-coloured Brunsfelsia nitida, from Jamaica, was shown in this class by Mr. Mitchell, of Brighton; Marshall's Wallflower, diffusing a fragrance like that of Violets, by J. Edwards, Esq., of Holloway; the Oleander-leaved Allamanda, and some equally well known plants from Messrs. Henderson, of the Wellington-road Nursery. We also remarked that Certificates of Merit were awarded to cut specimens of Beaumontia grandiflora, and the very fragrant Murraya exotica. Mrs. Lawrence had Pimelea Nieppergiana, Hoya bella, and a cut spike of Amherstia nobilis.

Pelargoniums.—Nurserymen: the first prize was awarded to Mr. Turner, Royal Nursery, Slough; 2, to Mr. Beck, of Isleworth; 3, Mr. Bragg. Amateurs: 1st, Mr. Cock, of Chiswick; 2, Mr. Robinson. Six plants: 1st, Mr. Bray; 2, Mr. Chapman; 3, Mr. Gaines. Fancies—Nurserymen: 1st, Mr. Ayres; 2, Mr. Gaines; 3, Mr. Ambrose. Amateurs: 1st, Mr. Cock; 2, Mr. Robinson; 3, Mr. Miller. Capes: 1st, Mr. Parker; 2, Mr. Roser.

Among seedling Pelargoniums, the best was Mr. Hoyle's Magnet, which was awarded a Certificate of Merit for fine colour, and abundance of bloom. He had also Chieftain, which is a good flower, and others; Mr. Turner showed First of May; Mr. Dobson, gr. to Mr. Beck, Leader, a very promising flower, Gem, Vulcan, and Isabella; and Mr. Ayres received a Certificate of Merit for his Fancy called Formosissimum.

Calceolarias were furnished by Mr. Gaines. Although good, we did not remark among them anything new or very striking.

Cinerarias were shown by Messrs. Henderson, Lane, and Gaines. The sorts consisted of well known kinds.

Verbenas.—Two or three nicely managed plants were produced by Mr. Lockner. The varieties were Minerva, Wonderful, Desdemona, Heroine, Perrier, and Reine du Jour.

Rhododendrons.—We noticed a glowing crimson kind from Messrs. Rollisson; and Messrs. Standish and Noble had a purple sort with very large trusses. The latter looked as if it might be hardy.

Pansies were shown by Mr. Turner, Mr. Bragg, and others; and we observed a stand of Tulips in tolerable condition for the season.

Among Miscellaneous, Subjects were some Ferns and Lycopods, a few Alpines and a small group of Banksias, and similar plants.

---

Entomological, *May* 5.—J. O. Westwood, Esq., F.L.S., President, in the chair. Mr. Samuel Stevens exhibited a new British species of Curculionidæ allied to Dorytomus, recently captured near Fenny Stratford, on Sallows; also a living specimen of the fine Callidium sanguineum, from Bromley, Middlesex; also an Adela cuprella, being the second known British specimen; and a beautiful series of beetles and butterflies from the river Amazon, just received from Mr. Bates. The President stated that an entire bed of Strawberries, planted last autumn in his garden at Hammersmith, had been destroyed by a very minute beetle (Haltica ærata) closely allied to the Turnip flea, the leaves and young shoots being completely riddled by the insects. The plants were of the Alpine variety, termed the "Fraises des quatre saisons." Mr. Sheppard exhibited a hermaphrodite individual of the Poplar hawk moth, the right side being male, and the left side female. Mr. Waring exhibited some very remarkable spiders from the west coast of Africa. A note upon the Economy of Trichiosoma lucorum, by Mr. Maysmor, was read. An elaborate paper, by Dr. Davy, was also read, containing a detail of numerous experiments made with insects of different orders and genera; showing the effects produced upon them by changes of temperature, and by immersion in various gases and vapours, such as carbonic acid gas, azote, oxygen, coal gas, ammoniacal vapour, muriatic acid, nitric acid, alcohol, chloroform, sulphuretted hydrogen, &c. Mr. F. Smith exhibited several female winged ants taken at unusual periods, namely, Myrmica graminicola taken in December, and Formica cunicularia taken in April. He also read some notes communicated by Mr. Ker, on the habits of several species of bees and wasps from New Holland, belonging to the genera Lestis (in which he described a new species generally confounded with L. muscaria) and Abispa, the former of which are reared in cells, placed one above another in the soft wood of the Xanthorrhea, whilst the latter is solitary in its habits, forming a nest of clay, with a curious thimble-shaped orifice at its lower edge. Mr. Douglas exhibited a specimen of a very delicate species of gnat (Trichocera sp.?) which he had reared from a pupa which had bored itself a passage through the hard sand-stone of a quarry at Charlton, Kent. Mr. S. Stevens brought for distribution specimens of Hylastes rhododactylus, reared from Broom stumps from Coombe-wood. The President stated, that for the accommodation of foreign Entomologists who might visit London, during the Exhibition in Hyde-park, the Council had resolved, that the Society's collections might be inspected any day, in company with an ordinary member.

## Miscellaneous.

*Quercus agrifolia, a hardy evergreen Oak from California.*—A few miserable living plants of this species were sent home by Hartweg from California, and are now beginning to grow in the Society's Garden. It will probably be a hardy evergreen tree, concerning which Nuttall, who knew it in its native country, has the following remarks:—"This species, almost the only one which attains the magnitude of a tree in Upper California, is abundantly dispersed over the plain on which St. Barbara is situated, and, being evergreen, forms a conspicuous and predominant feature in the vegetation of this remote and singular part of the Western world. It appears more sparingly around Monterey, and scarcely extends on the north as far as the line of the Oregon territory. It attains the height of about 40 or 50 feet, with a diameter rarely exceeding 18 inches; the bark is nearly as rough as in the Red Oak. The wood, hard and brittle and reddish, is used only for purposes of fuel, or the coarse construction of log-cabins. As an ornamental tree for the south of Europe or the warmer States of the Union, we may recommend this species. It forms a roundish summit, and spreads but little till it attains a considerable age. As a hedge it would form a very close shelter, and the leaves, evergreen and nearly as prickly as a Holly, would render it almost impervious to most animals. The leaves vary from roundish ovate to elliptic, and are of a thick rigid consistence; the serratures are quite sharp; the young shoots are covered more or less with stellate hairs, and for some time tufts of this kind of down remain on the under side of the midrib of the leaves, which are, however, at length perfectly smooth, and of a dark-green above, often tinged with brownish yellow beneath. The staminiferous flowers are very abundant, and rather conspicuous; the racemes the length of 3 or 4 inches; the flowers with a conspicuous calyx and 8 or 10 stamens; the female or fruit-bearing flowers are usually in pairs in the axils, or juncture of the leaf with the stem, and sessile, or without stalks. The cup of the acorn is hemispherical, and furnished with loose brownish scales; the acorn, much longer than the cup, is ovate and pointed. We do not recollect to have seen this tree properly associated with any other, except occasionally the Platanus racemosa; their shade is hostile to almost every kind of undergrowth. By Persoon this species is said to have been found on the eastern coast of North America, while Pursh attributes it to the north-west coast, about Nootka Sound. It does not, however, extend even to the territory of Oregon, as far as my observation goes." Née says, "I have only seen branches collected at Monterey and Nootka. The leaves of the young plants are perfectly smooth when first developed, of a thin consistence, with numerous slender sharp dentures beneath; they are of a brownish yellow colour, and appear smooth and shining." The long narrow acorns, almost conical, are a remarkable feature in the species. *Journal of the Horticultural Society*, vol. vi., p. 157.

*Hothouses in the time of the Romans; by M. Dureau de la Malle.*—In the memoir a short time since read to the Academy upon the subject of Roman hothouses and pits, heated artificially, I omitted several quotations which proved my statements, and they have consequently been impugned. My first authority is Columella (XI., 3, 51, 53). Tiberius being in ill health, was advised to eat Cucumbers every day. The Roman gardeners cultivated these vegetables in frames, containing hot dung, and exposed to the sun in front of a wall. The frames were, moreover, on wheels, so as to be easily moved into, and continually placed in the sun's rays, and were, in addition, furnished with pieces of talc, by which they were covered at night, and by which the plants were protected from frost and cold. "Thanks to this invention," says Columella, "Tiberius was supplied with Cucumbers at nearly every season of the year (*fere toto anno*)." Martial (VIII., 14), the contemporary of Domitian, who had in his palace a hothouse, containing exotic plants, called

Adonea, describes a glass hothouse, belonging to one of his patrons, which was set apart for similar plants, as follows, in one of his Epigrams :—"As you are afraid that your pale fruit trees, natives of Cilicia, cannot withstand the winter, and that a too cold wind may nip your delicate shrubs, you take care that by panes of talc the chilly wintry blast may be kept off, and that nothing be admitted but sun and a genial air ; and yet I have nothing but a miserable lodging, with a window that does not fit, and where Boreas himself would not find a habitation. Is it thus, cruel man, that you lodge an old friend! I had much rather be the guest of your tree!" The use of some heating apparatus is here clearly referred to ; but Seneca (Letter 122) tells us that the Roman hothouses were heated by steam. He denounces the unbridled luxury of his contemporaries. "Do not those live contrary to nature who require Roses in winter, and who, by the use of hot water, and application of heat, compel the Lily to blossom in winter, instead of in the spring?" It is remarkable that the most direct evidence of the use of hothouses by the Romans should be furnished by a poet and a philosopher. *Comptes Rendus.*

## Calendar of Operations.

*(For the ensuing week.)*

### PLANT DEPARTMENT.

Although the general potting has by this time been completed, there will be some plants, particularly young ones intended for specimens, that will require another shift ; and many free growing plants will require larger pots once a month, until they are about to commence flowering ; when they should be assisted with liquid manure and top dressings of rich soils. If the pots have been perfectly drained, and the plants potted in open soil, water may be liberally administered to those which are growing and rooting freely ; but, if anything like stagnation be observed, the fault may generally be attributed to some defect in the drainage, which should be immediately examined, and put right. A sufficiency of air to produce a free circulation should be at all times admitted in the houses ; but during the more active season of growth, more than this is unnecessary, unless for the purpose of moderating the temperature in very hot weather. Shading should only be used in strong sunshine, and should be so arranged that it may be easily removed or reapplied in changeable weather. All growing plants will require constant attention, in the training and occasional stopping of the young growths, especially of those intended to form handsome specimens. To plants in a growing state, the allowance of heat, shade, and moisture, during the day, should be increased rather than decreased, proportioning them to the still increasing strength of light. A temperature of 68° is sufficient for anything during the night, and whenever the weather is so warm as to raise the internal temperature higher than this, give air more abundantly ; but even in this case, a little fire will be necessary the last thing at night, to prevent the house being too cold at daybreak next morning. Syringe early in the afternoon, that the superfluous moisture may dry up before dark ; and in order to assist this, some of the ventilators should be opened about a couple of hours after syringing, and be allowed to remain open all night. This applies especially to houses with closely glazed roofs, where sufficient air to prevent stagnation cannot enter by means of the laps. Begonias that have had a rest after flowering will now require to be cut in a little, and to have their shape regulated ; and when they begin to grow, let them be repotted, using turfy loam, peat, and a little rough leaf-mould. If placed in a warm house, and syringed freely in the evenings, they will soon commence their new growth ; after which, they must have plenty of air, to prevent their becoming weakly. Pelargoniums, Calceolarias, and other summer-flowering greenhouse plants, should have sufficient room to enable them to enjoy the full benefit of the sunlight, with a free circulation of air. The flower-stems of the Calceolarias should be supported with small neat stakes.

### FORCING DEPARTMENT.

Pineries.—Let the plants be liberally supplied with air and moisture during their growth, and especially those which are swelling their fruits. The latter should be watered with liquid manure, and where it is desirable to produce the fruit as large as possible, its swelling will be assisted by removing useless suckers, and by affording a slight shade during bright sunshine. Maintain a moist atmosphere by sprinkling the paths, walls, and other evaporating surfaces, and by loosening the tan, to induce an exhalation of the congenial vapour arising therefrom. Vineries.—Attend to tying, thinning, and stopping. Where plants of any kind are necessarily grown beneath Vines, the shoots of the latter should be stopped at the first joint above the fruit, and the spurs on which there is no fruit should be stopped at the fourth or fifth leaf. This will also apply to Vines on the rafters of greenhouses, which are just now being thinned and regulated. In disbudding, not more than twice the number of shoots necessary to produce a crop should be retained, one half of which will carry bunches this year, and the other half will make wood on which to produce next year's crop. Peaches and Nectarines, which are just ripening, should be assisted by a dry atmosphere, a free admission of air back and front, and by removing any leaves which shade the fruit from the rays of the sun. In the succession house, very little fire will be required [illegible] night, if the sun-heat is properly economised by [illegible]ing early in the afternoon. Tie in the young shoots [illegible]y advance.

### FLOWER GARDEN AND SHRUBBERIES.

Even in the latest situations, the planting out will now be nearly completed ; and the chief things requiring attention will be the watering of all plants that need it, and the bringing on of the late struck cuttings as quickly as possible, to make up for any that may be deficient. There are few places in which a sufficiency of room is provided for those beautiful and useful plants, more particularly grown for bedding purposes ; and as late struck cuttings soon come into flower, if carefully removed from the frames into the flower-garden, we would recommend every possible attention to be paid to them. Places which are not visited by their respective owners before August, may be made to look gay, with cuttings not put in before April. We have put cuttings of scarlet Geraniums into a border in June, which were a perfect mass of flowers in September, without any other attention than merely watering them after they began to grow. Annuals which have been sown or pricked out into frames or beds will now require transplanting into their final situations, and biennials into reserve beds for planting out next spring. A sowing of annuals should now be made for autumn flowering, including Mignonette, Nemophila, Virginian Stock, Silene, Collinsia, Sweet Peas, Gilia, Kaulfussia, Godetia, Clintonia, and any others which are sufficiently showy, and come quickly into flower.

### HARDY FRUIT GARDEN.

Proceed with the final disbudding of Peaches and Apricots on the walls, leaving no more shoots than can be laid in without crowding. Where the young shoots seem likely to grow very strong, they should be stopped as soon as they have made from four to six leaves ; and from the laterals consequently produced, one or more may be selected, which will generally form good bearing shoots of moderate strength ; but if the wood they produce is still too strong, stop again, and continue the practice as long as the tree persists in throwing out strong growing shoots. This moderates the growth in those parts which are too vigorous, and helps to diffuse the sap over the whole tree with greater uniformity. The neglect of timely and judicious stopping of the gross shoots often proves to be the ruin of many a fine tree. Where the Peaches, Nectarines, and Apricots have fortunately set an abundant crop of fruit, it will be necessary to examine them carefully, and to take some away where they are too thick ; this should be done when they are about the size of Cob-nuts, as they come in usefully for tarts and preserving. Attend vigilantly to the destruction of caterpillars and aphides. Continue to let down the canvas screens at night, whenever the weather is wet or cold ; and wash the trees frequently with clean soft water by the engine.

### KITCHEN GARDEN.

A cool moist atmosphere should be maintained in the Mushroom house, and cleanliness strictly attended to ; let the hay used for covering the beds be occasionally changed, as it forms a more congenial harbour for insects, when allowed to get old and musty. Pay attention to the destruction of woodlice, by laying slices of Turnips to attract them, in addition to which a few toads should be kept on all the beds. The Onions will soon require thinning, and if a sufficient breadth has not been sown, a bed should be prepared for transplanting those into which are thinned out of the principal bed. Make a sowing of the silver-skinned variety, moderately thick, to produce small bulbs for pickling. Give plenty of room to all growing crops, and stir the ground frequently with a fork, to encourage their progress, and to keep down weeds. Make successional sowings of all summer vegetables which are of short duration, as Peas, Beans, French Beans, tall Runners, Spinach, &c., and salads of all kinds ; also early Cabbages, and a small sowing of Cauliflowers for late autumn and early winter supply. For Spinach crops, sown at this season, the ground should be rich and deep, or the produce will be bitter, and will soon run to seed. Transplant Celery, and water freely, that the young plants may not suffer from the check, or from drought.

State of the Weather near London, for the week ending May 15, 1851, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 23d, 1847—therm. 89 deg.; and the lowest on the 23d and 24th, 1837—therm. 30 deg.

## Notices to Correspondents.

Back Nos. : The volumes for 1849 and 1850 may be had, price 30s. each.—Full price will be given for Nos. 41 and 45, 1850. —Full price will be given for the following Numbers, *with the Newspapers*, or half price for the Newspaper alone : 1845—12, 34, 35 ; 1848—49, 50.

Bees : *H.* The improved cottage, with a board and *one* glass at the top. *Y.*

Canary, Tricks of the : *Emily B.* You must immediately remove your pair of canaries from their breeding cage, and place them in a smaller cage. As they agree so well together, by all means let them live under the same roof ; but as Nature has furnished them with such egregiously large organs of "destructiveness," put them up for breeding purposes no more. Provide yourself at once with a younger pair of lively, gay-coloured canaries, and you have yet time to secure three fine healthy broods. *W. K.*

Cinerarias : *G R T.* No correct opinion can be formed of the quality of seedlings until they have flowered. Form of habit will not always indicate value, and therefore we would reject none until they had blossomed.*

Cotton Blinds : *R A H.* We doubt whether Linseed oil will prevent their mildewing ; but if dipped in a solution of chloride of zinc, they will be saved.

Ferns : *T W.* They have no flowers. Count Zuminski's observations by no means lead to any such inference ; nor do they in the least disturb the views of systematists. This, however, is a question of pure science, which we cannot discuss here.

Insects : *W G.* A dry situation, with camphor, cajeput oil, or a few drops of quicksilver in the drawers, will prevent the ravages of mites. The bodies of greasy moths should be moistened with naphtha. *W.—R S.* Strips of paper tied tightly round the stems of your fruit trees and standard Roses, and well covered with tar or bird-lime, will prevent the beetles you have sent (which are the Otiorhynchus vastater) from ascending your trees. It is better also to place a white cloth or sheet under the trees, and shake them on approaching them with a light after dark, rather than hunting for the beetles by hand, as they fall on being alarmed. *W.*

Manures : *J Macaulay.* Mix it with peat charcoal, or any other fine and soft charcoal. Peat ashes will not answer. Mr. Cuthill's Treatises are still on sale ; you can procure them by applying to him at Camberwell.

Market Gardening : *F G.* Mr. Cuthill's papers on this subject can only be had in the *Gardeners' Chronicle.*‡

Melon Leaves: *F H S.* Your leaves are in a terrible pickle. It seems to us that they have been infested with thrips, and that they have been brought to their present state by unskilful attempts at destroying this pest.

Mice : *J B.* We know of no better plan of getting rid of them, than by trapping them. This, we should think, might be effected without difficulty, provided proper skill is employed in baiting and setting the traps. ‡

Names of Plants : *Erzeroum :* 400, Campanula glomerata ; 479, C. rapunculoides.—*Carring Cathol.* Yellow Banksian Rose and Baccharis halimifolia.—*George Pickering.* It seems to be some kind of Hoarea ; but a broken leaf and a rough sketch do not enable us to speak precisely. Cassia mimosoides is an old plant, and probably exists in somebody's garden ; though we do not remember having seen it cultivated.—*S A.* 1, Tritoma media ; 2, Cochlearia officinalis ; 3, no flowers.—*T D H.* One is no doubt a mere variety of Dendrobium densiflorum ; the other is a curious thing, certainly allied to Cœlogyne, and especially to C. prolifera, but not in a state for determination. We have it from Mr. Lobb, who gathered it on the Khasiya Hills.—*R J G.* Asplenium lucidum, Forst. *S.—Phlox.* Some kind of Mesembryanthemum, not determinable without leaves.—*M G W.* Acineta Humboldtii, badly coloured.—*P B.* A variety of Oncidium stramineum.—*E S.* Hippeastrum vittatum.—A few enquiries stand over for further consideration.

Nightingales : *John Bailey.* As your butchers only "kill" once a week, keep your beef on marble (in a very cold cellar), covered over with a fine wire sieve. Ants' eggs, and mealworms, are excellent of their kind, but they must be given sparingly to these birds when in confinement. They subject them to fits. Meal-worms are a yellow, dry worm, found in meal, and are obtainable at any miller's, or through a baker. Keep them in a jar, with meal and flannel in it ; but let no damp come near them. Hang your bird on the wall of a quiet room facing the window. Administer the bath every morning, removing it immediately his majesty has retired from it. The other questions will be considered in the forthcoming article. *W. K.*

Peach Trees : *F L H.* It is now too late to prune or shorten your trees planted last October ; and their branches, from 3 to 5 feet, are too long to break well if not assisted. You must disbud the extremities, and then the eyes will break near the bases of the shoots, where you require them.‖—*Northwood.* Cold is the cause of those swollen curled leaves everywhere so abundant this season. Nothing can be done till warm weather sets in, and then healthy foliage will appear, and the other should be picked off. In the mean time take care that no green-fly exist ; snuff will kill it.‖

Pear Trees : *S T.* The evil is incurable ; it seems caused by cold. Have patience ; the trees will recover without assistance : at least we see no sign of constitutional disease.

Seeds : *N B.* Raise them in gentle heat ; sowing the Pine seeds in pure loam and the Rhododendrons upon peat. When they come up, and have formed their true leaves, harden them off by degrees.

Stoves : *A J B.* In order to maintain moisture in the air, you must syringe copiously, or throw down water upon the floors, or place *upon* your Phœnix stove a vessel containing water. A tub of water is useless. Moist earth will damp the atmosphere as long as the surface of the earth is wet, but not longer. Your own sensations will tell you nearly enough whether air is dry or damp.

Yews : *R A H.* Yes ; if you will reduce the top of the taller Yew, you will throw so much strength into its young branches that it will soon equal its companion ; but on no account use manure. You may employ an infusion of peat in alkaline water, if you have it ; but it will be just as well to let the roots alone.

Misc : *E D.* As you intend to emigrate to Illinois, Downing's "Fruit and Fruit Trees of America" will prove a suitable work. The Peach, in that country, is raised from the stone, or worked on Peach stocks. The trees grow vigorously for some years, and then they become generally affected by what is termed the *yellows.* A similar effect is produced by the Peach stock in this country. You ought, therefore, to use Plum or Almond stocks ; and if all your large family can learn to bud previously to leaving this country in August, so much the better. ‖

### SEEDLING FLOWERS.

Azaleas : *J J.* White, striped with red ; small and very badly formed.*

Calceolarias : *S W.* A nice flower, in the way of Lady Constable. Its faults are, too large a throat and want of smoothness.*—*G H.* Straw-coloured ground mottled with brown. A very nice flower, but *rather* too large in the throat.*

Cinerarias : *A Z.* Pretty, but too small.*

Pansies : *J F.* They should be at least as large again to be worth anything.*—*S S.* A showy border variety. It will not make a good show flower, on account of its colours not being well defined.*

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS,

AS THE

ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by Dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9l. 10s. per ton, or 9l. 5s. in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.

40, Bridge-street, Blackfriars, London.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per on, in dock. Sulphate of Ammonia, &c.

ARTIFICIAL MANURES.—PRIVATE INSTRUCTIONS in Chemical Analysis and the most approved methods of making Artificial Manures are given by J. C. NESBIT, F.C.S., F.G.S., at the Laboratories, Scientific School, 8S, Kennington-lane, London.

Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

GUANO AND OTHER MANURES.—Peruvian Guano of the finest quality; Superphosphate of Lime; Gypsum; Salt; Nitrate of Soda; Moffat's Patent Concentrated City Sewage Manure, and all others of known value.—Apply to MARK FOTHERGILL, 204, Upper Thames-street, London.

TAN (Gratis), fresh from the pits.—Apply to ESSEX and SONS, 28, Stanhope-street, Clare Market, London, in the immediate neighbourhood of Covent Garden.

NEW TURNIP MANURE, 50s. a Ton.—Mr. POTTER can strongly recommend the above as a cheap and efficient Manure, and capable of raising heavy crops. Delivered free on rail. The Bags to be returned or paid for.

POTTER'S GUANO, 7l. per ton; SUPERPHOSPHATE OF LIME, 6l. per ton; GYPSUM, 25s. per ton, including bags and delivery on rail.—28, Clapham-road-place, London.

HOSE FOR LIQUID MANURE, Fire-engine, and agricultural purposes, made of canvass, lined and coated with gutta purcha; it is about one-third the price of leather or india-rubber, will convey liquids of all kinds under a heavy pressure, it is extensively used at the Government public works; also by the navy, and amongst agriculturists, giving universal satisfaction. Testimonials and prices may be obtained of Messrs. Burgess and Key, 103, Newgate-street, sole manufacturers.—London Agents: Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.—Country Agents: Messrs. Ransome and Parsons, Ipswich; Messrs. J. and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. S. Wilson, Agent for Scotland.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers: Office, 70, Strand, London.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, BREWERS' USE, &c.

PATENT VULCANISED INDIA RUBBER HOSE-PIPES AND FLEXIBLE GAS TUBING.

JAMES LYNE HANCOCK (sole Licensee and) Manufacturer, Goswell-road, London.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, for portable Gas Lamps, and all purposes where a perfectly sound Waterproof and Flexible Pipe is required. Hot Liquors or Acids do not injure them; they are, therefore, much used for Chemical purposes, as they require no oil or dressing when out of use; are particularly suitable for Fire Engines, and are found exceedingly useful in dwelling houses for conveying Hot or Cold Water to Baths, &c.

Testimonials and prices may be had on application to the Manufactory.

N.B. Vulcanised India Rubber Garden Hose, fitted up with Roses, Jets, and Branches complete, with union joints ready to attach to pumps or water cisterns.

All Orders or Letters addressed to J. L. HANCOCK, Goswell-mews, Goswell-road, London, will meet with immediate attention.

Waterproof Fishing Boots and Stockings, Portable India-Rubber Boats, Shower and Sponging Baths, Air Cushions and Beds, made all sizes to order.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY, empowered by Act of Parliament to execute all works of Drainage (including outfalls through adjoining estates), to erect Farm Buildings, and carry out every kind of permanent improvement upon estates under settlement; to provide the money, or to enable the landowner to employ his own capital, and execute the works by his agents, and to secure repayment of the outlay by charge on the property improved spread over a number of years.

Applications for the execution of works to be addressed to WILLIAM CLIFFORD, Secretary.

Offices, 52, Parliament-street, London.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

THE ANNUAL COUNTRY MEETING of 1851 will be held, by the gracious permission of Her Majesty and Prince Albert, in the HOME PARK, WINDSOR, in the week commencing MONDAY, the 14th of JULY.

Copies of the Prize Sheet, containing the terms, conditions, and amount of the respective Prizes, and the Rules of Exhibition, and also copies of the requisite printed Forms of Certificate, may be obtained on application to the Secretary, 12, Hanover-square, London. All Certificates must be returned, filled up, to the Secretary, on or before the **17th of May**, the Council having decided that in no case whatever shall any Certificate be received after that date.

In the application for Certificates, the Character and Age of the Animals to be exhibited should be stated, in order that the proper Forms of Certificate may be sent.

By order of the Council, JAMES HUDSON, Secretary.

12, Hanover-square, London, May 17.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

THE MAY GENERAL MEETING of the Society will be held at the Society's House, in Hanover Square, on THURSDAY, the 22d May at 12 o'clock.

By order of the Council, JAMES HUDSON, Secretary.

London, May 17, 1851.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND is desirous of receiving Tenders from Innkeepers or others, to contract for the supply of a Cold Dinner for 2000 persons in the Society's Pavilion, in the Home Park, Windsor, on Wednesday the 16th of July, 1851. Printed forms of Tender may be obtained on application to the Secretary, at the Office of the Society, No. 12, Hanover-square, London; and they must be returned to him, filled up, on or before Monday the 9th of June, 1851, the Society, however, not binding itself to take the lowest Tender.—By order of the Council,

London, 14th May. JAMES HUDSON, Secretary.

# The Agricultural Gazette.

*SATURDAY, MAY* 17, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, May 21—Agricultural Society of England.
THURSDAY, — 22—Agricultural Imp. Soc. of Ireland.
WEDNESDAY, — 28—Agricultural Society of England.
THURSDAY, — 29—Agricultural Imp. Soc. of Ireland.

ON former occasions we have adverted to one of the fallacies which has crept into agricultural geology, and which has contributed much to retard its progress—the assumption of a more intimate connection than has any existence in nature between the rock formations and the soils which cover them. The exception has, in this case, been mistaken for the rule. It would be easy to show on agricultural evidence, even with the scanty information which we at present possess, that local soils—that is, soils derived wholly from the rock immediately below them, are confined to particular situations, as, for instance, to steep escarpments, and to certain elevations. This holds good, whether we examine limited areas, and trace the variations of soil over the several formations, or whether we regard the British isles as one geological district, which has been subject to that series of operations by which the superficial deposits were formed, denuded, and rearranged. Viewed in this light, those larger areas, which are the least encumbered with these deposits, will be found to owe this immunity to the elevations at which they occur, or to the form of the surface; and though such districts constitute the strongholds of those who derive all soils from the real substrata, the assumed surface of geological maps, they merely exhibit on a large scale that dependance of the distribution of soils on contours which is apparent on a smaller scale, when we examine minor districts in detail.

It is not our intention to pursue the subject further at present. We propose rather to point out another fallacy which has met with too ready credence, namely, the assumed variation in the character of alluvial soils, with the variation in the rock formations through which the rivers which deposit them have flowed. This is only true of the alluvium near the head-waters of the large rivers, and on the banks of their minor tributaries. Near their mouths, where the principal alluvial tracts are situated, such deposits must be of a very mixed character, composed of fine detritus derived from a great variety of formations. This will be evident, whether we examine the course of the Severn or of the Thames, of the Humber, or of the various streams which discharge their waters into the estuary of the Wash. Let us commence with the Severn: it rises among the slates and sandstones of the lower silurian group; through which it flows southwards for about 50 miles, gathering strength as it goes

> "From a thousand petty rills
> That tumble down the snowy hills,"

when it emerges from amid the mountains composed of these ancient strata, and enters the plain of the new red sandstone, it turns to the south-east, and maintains that direction for about 25 miles, skirting the edge of the upper silurian shales and limestones of the Wrekin and Wenlock Edge, with their associated trap rocks. At the gorge of the iron bridge it crosses those strata and the coal measures of Coal-Brook Dale; and, turning southwards, re-enters the new red sandstone, through which it flows by Worcester to Tewkesbury; except for a small portion of its course, between Alveley and Bewdley, which lies through the coal measures. Near Worcester, it receives tribute from the old red, chiefly through the medium of the Teame; while further south, silurian and trap detritus is brought down by some minor streams from the Malverns and the Woolhope Valley. At Tewkesbury the confluence of the Warwickshire Avon takes place, which has flowed through lias and the marls of the new red. Through these rocks the Severn, thus augmented, holds its onward course by Gloucester to Berkeley, touching the old red on its right bank, from near Newnham to the coast opposite Berkeley. On the left bank, at Berkeley, the great alluvial tract of the Severn commences; south of that point the Wye, the Taff, and rivers of smaller note, pour down, on the west, detritus from the old red, the carboniferous limestone, and the coal measures. On the east the Avon of Somersetshire, the Parret, the Axe, and the Brue, add to the spoils of these rocks, those of the lower oolite, the lias, and the new red.

The stream of the fair Sabrina was bright and pure when it commenced its course in regions (if we may credit the author of "Comus," who, we fear, had more poetical than geological authority for the assertion), where its

> "Billows roll ashore
> The beryll, and the golden ore."

It terminates, amid the slime and mud of the Bristol Channel, contaminated, like many bright beginnings, with numerous defilements contracted in its course; and among the varied materials held in suspension by the turbid waters, agitated by the billows, and borne to and fro by the tide, who will venture to refer each particle to its source? Who will venture to indicate the characters impressed, by a given rock formation, on the ooze urn deposited by the muddy current, wherever it finds a resting-place; or on the soil of the rich alluvial plain which extends from Berkeley to Bridgewater, and which was deposited, in a similar manner, in bygone centuries, under relative levels of land and sea, differing slightly from the present? Nor is it only from the many rock formations enumerated above that the mixed character, and with the mixed character, the fertility of this alluvial soil, has been derived. The plain of the new red sandstone from Shrewsbury and Worcester is deeply covered with deposits of sand, clay, loam, and gravel, which contain in great abundance large blocks, and small detritus of granite and other crystalline rocks, as well as of slate rocks, derived from Westmoreland and Scotland. Atmospheric action and the eroding and transporting powers of running water, must have acted even more powerfully and extensively on these incoherent superficial accumulations, than on the more consolidated strata which occasionally rise through them. Much fragmentary matter, both fine and coarse, which had been borne, under the influence of the glacial sea of the pliocene period, from regions distant some hundreds of miles, must have been mingled in this way with local detritus derived from the rocks which bound the area drained by the river and its tributaries. The alluvial soil of the Severn will, therefore, contain materials derived more or less from every rock formation in England, except those portions of the upper secondary strata, which lie to the eastward of the great central watershed of the island. The variations of soil in different parts of this or of any alluvial tract, may be traced, moreover, to different velocities in the currents from which the materials were deposited, rather than to differences in the composition of the rocks from which they were derived. When the muddy waters of the Humber and the Trent are spread over land which it is intended to improve by the process of warping, it is found that the quality of the soil is regulated by the velocity of the current from which it is deposited. Near the point of entrance where the waters flow briskly, nothing subsides but the coarser particles; and the soil is too sandy. To the remoter portions, where the current is sluggish, nothing is borne but the finer argillaceous particles, and too clayey a soil is produced. The richest soil is found in an intermediate situation, where a due intermixture of sand and clay forms a rich friable loam. So well are these facts understood, that the great art of successful warping consists in reducing them to practice, by so regulating the current, as eventually to distribute this loamy deposit over the whole area to be improved; covering with it those

portions over which sand and clay were thrown down, during the earlier stages of the process.

With these remarks we close our geological investigation of the course of the Severn. The Humber, the Wash, and the Thames, which will hereafter pass in review, will be found to yield similar results.

---

At the present moment of low prices of corn—when occupiers of heavy soils are looking out for fallow crops which will admit of profitable cultivation, and by producing an abundant growth of cattle food, will place them more nearly upon a footing with the light land farmer—we shall devote a portion of our space to a consideration of the merits of those plants which are likely to serve their purpose. Among these are the Mangold Wurzel and the Cabbage, both of which in some districts are extensively and profitably grown by heavy land farmers. The difficulties which these farmers have to contend with in the growth of roots are well known to be, first, that of securing a sufficiently fine tilth in the spring, for the vegetation of the seed, and afterwards, that the crop must be removed from the land and not fed upon it, as the injury occasioned by treading to the following grain crop is frequently greater than can be compensated for by the growth of the roots. Although the first of these objections will apply to Mangold Wurzel, yet neither of them can be urged with much force against the Cabbage, which grows to a large size upon strong loamy soil; and the fact of the plants being raised in a seed-bed and transplanted into the field, is greatly in its favour. Planting at wide intervals will admit of the frequent use of the plough or scuffler between the rows, so that nearly all the advantages of a bare fallow may be secured, whilst the constant stirring pulverises the soil, and will greatly benefit the growth of the crop; and without this stirring, the roots have to contend with an impervious mass of clod, hardened by drought, or saturated by rain into an impenetrable mass, into which it is vain to expect the young roots to seek for food. On the other hand, the pulverisation is highly acceptable to the plants, the soil is moist in dry weather, and wet sinks down without doing injury, so that the roots seek for food in a friable soil, from which, from the amount of moisture it retains, soluble aliment can always be obtained.

From the want of practice of the farm labourer, the expense of transplanting the Cabbage may, in many cases, cause it to be rejected by the farmer, who may consider it too expensive an operation, and more fitted for the market gardener; but we hold that many of the practices of the market gardener will have to be followed ere our farms are made to produce the greatest profit. Young Drumhead Cabbage plants may be purchased of nurserymen at 1*s.* 6*d.* or 2*s.* per thousand, and we have occasionally contracted for plants and planting at the rate of 2*s.* 6*d.* This shows that the expense of planting does not greatly exceed the cost of seed and sowing Mangold Wurzel or Swedes. One gentleman, a heavy land farmer, with whom we are acquainted, plants Cabbages in rows 5½ feet apart, the plants in the row being 21 or 22 inches apart. At these distances an acre requires about 5000 plants. In the intervals between the rows he pulverises by repeated ploughings, and he considers he has all the advantages of a summer fallow, with the benefit to be derived from a heavy and nutritious crop of winter food.

Upon rich loams, peats, as well as upon most of the best description of Turnip soils, Cabbages may be transplanted upon ridges, dunged and prepared in the same manner as for Turnips. The ridges being 27 inches apart, and the Cabbages planted 2 feet apart in the rows, about 10,000 plants will be required per acre.

Cabbages may be planted in May, to be given to sheep in September or October, and the planting may continue at intervals to the end of June, to secure a supply through the winter. It is excellent food for almost all kinds of stock. We have used it for fatting sheep, ewes, cows, bullocks, and pigs, and we have plenty of satisfactory evidence of the feeding and milk-producing qualities of the plant.

A writer in the last Number of the "Highland Society's Transactions," concludes a prize essay upon the cultivation of field Cabbage thus—"The Cabbage having made part of its growth when planted in the field, and not raised there from seed, is a fact of some importance, especially upon land highly cultivated, where vegetation is rapid, and the plants arrive at maturity in a comparatively short period. Here the Cabbage may follow Tares, mown or fed off; and a good crop for winter use may be grown upon stiff soils, where the difficulty of producing a finely pulverised seed-bed, and the ravages of the Turnip-fly, too often prevent the agriculturist from an attempt at Turnip culture. The transplanted Cabbage may, in some degree at least, supply its place; and it is upon this class of soils that it is likely to be of most benefit."

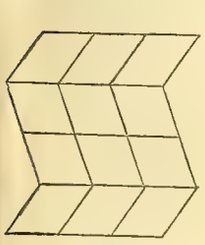
With the writer of the above essay we must leave the matter in the hands of those who are inclined to give this crop their attention, convinced, as we are, that a fair trial of its growth will have much more influence in extending its culture than aught we can write in praise or condemnation of this or any other farming practice. We can merely point out what may improve or aid the agriculturist, and leave him by actual practice to prove whether he can benefit by it.

---

## REPORT ON THE AGRICULTURAL SECTION OF THE GREAT INDUSTRIAL EXPOSITION OF THE NINETEENTH CENTURY.

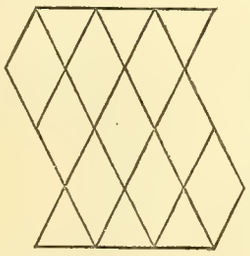
No. II.—Those who rejoice in the conquests obtained by mind over matter, and in the successful efforts of ingenuity to save toil, will experience a rich treat in wandering amongst the wheels and straps and busy clatter of the "machinery of motion;" and after surveying the marvellous aids which mechanism has furnished to the manufacturer, will be equally delighted when, crossing over from the north to the south side of the western half of the building, they see the beautiful "agricultural machinery"—here at rest because its destination is for the broad field rather than the crowded factory—and contemplate what mechanism has done for the farmer. And here amid the many available instruments of culture are some which seem to indicate the *desiderata* of agriculture rather than supply the deficiency; for notwithstanding the repeated attempts of ingenious mechanists, the inventive skill which has superseded the use of finger and thumb in spinning has not yet dispensed with the eye and hand in guiding a plough, or substituted a steam horse for a living one in drawing it. Nor has the ingenuity which sometimes contrives in manufacture a new process supplanting one hitherto performed by hand, been able as yet to introduce a new mode of tillage better than that of the plough and spade.

For years we have been startled by paragraphs in the papers announcing the perfection of a steam plough, or of some implement that could convert a piece of Couch-encumbered stubble ground into a proper seed bed at one operation; but unfortunately these notices have never been followed by descriptions of the renovation taking place in general farm practice from the extending employment of these things. Lord Willoughby de Eresby's steam plough, the only one exhibited in the great glazed forcing-house of invention, is perhaps the most workable engine of the kind yet constructed. From the accounts which have appeared respecting its performances, it seems able to turn over land of anything like a favourable kind; but whether the expense of the operation, the laying down of tram rails across different parts of the field, the difficulty of adjusting the ploughs to varying circumstances during their work, &c., will be compensated by the rapidity of execution and other advantages, must be left to experiment and the judgment of those who have seen it work. The steam-engine is portable but not locomotive, and drags the ploughs towards it by a chain. There are four iron ploughs, with coulters before them and subsoil tines behind, all fastened in one iron frame, and so arranged as to follow each other at a suitable distance in four separate furrows. The frame or carriage, composed of longitudinal and cross bars, is mounted upon three small wheels, besides two in front, apparently intended for steering. Each end can be lifted or lowered by means of two levers, the handles of which meet about the centre of the carriage, where there is a platform seemingly for the driver to ride upon. An endless chain, extending from a drum or barrel upon the engine to a pulley fixed at some distance down the field, passes double through friction rollers on the carriage; and, by pinching either of the chains with two wedges and levers, the frame, with its ploughs, travels either forward or backward at the rate of five miles per hour; and, by letting the chains go, the progression can be instantly stopped. The difficulty in such machines has hitherto been the power wasted by the engine in drawing the ploughs back again from the engine toward the pulley; but this seems to draw the ploughs backwards, and out of work, to the far side of the plot to be ploughed, and thus perform the work only by a direct pull—the land being all turned one way, as in turn-wrest ploughing. The engine is mounted by springs upon wheels with flat tires, so as to run on common roads, and in the field it traverses tram rails at right angles to the direction of the chain and the furrows—the sectional form of the rails, so as to fit the flat-rimmed wheels being this: ⌋ ⌊. There are two horizontal cylinders within the boiler, just above the fire-box, which work an axle with fly-wheel and gear work, turning the drum underneath the boiler, upon which the chain is once or twice wound. There are two pairs of eccentrics and links for reversing the valves. The regulator is not like the common "governor," but consists of two balls at opposite ends of a bar, the middle of which is attached by a joint to the end of a horizontal spindle. When motionless, the bar is inclined to the spindle; but when revolving, the centrifugal force of the balls tends to draw the bar at right angles to it: an eccentric curve upon the bar slides a rod within the spindle which communicates with the steam valve. "C. W. H." admirably demonstrated in our columns, some time ago, that the plough is an imperfect kind of implement, and that attempts to employ steam for horse labour will not succeed unless it be made to stir and turn up the soil without sliding, pressing, and forming a hard pan upon or within it. After reading his capital idea of the wheel-cultivator required, which should revolve with a motion independent of its bodily advance, we certainly anticipated a sight of his machine in the Exhibition; but not even the idea in any altered form is to be here discovered. A few contrivances of a different nature are shown, however, for stirring or turning the soil without ploughing it. A ponderous machine, by G. Thompson, of Great George-street, Westminster, we take to be an apparatus for digging; seeing that it is furnished with several spades: we are unable to divine whether it is intended for horse or steam-power, there is no boiler or engine upon it, though there is room for one; and perhaps this has yet to be added, seeing that although poles or shafts are attached, no force of horse-flesh could possibly drag it along. This patent machine is an immensely strong timber rectangular frame, about 11 feet by 8, horizontally resting on an axle with two carriage-wheels, each of nearly 7 feet diameter. One of these wheels is iron, having internal tooth-work near its circumference, and driving by two motions a shaft along the hinder end of the frame. This shaft has six cranks, three pointing one way, and three, which alternate with them, pointing in another direction at right angles with the first. Six iron spades are suspended from these cranks by what we may call their "handle" ends; and about three quarters of the way down the shaft of each, is a cross piece with friction wheels, working up and down in slides, so that as the cranks revolve the spades receive much the same motion as that given to a common spade in the hands of a labourer. Three spades enter the ground at once, and three deliver their load together,—a fixed knife or scraper taking the earth cleanly off from them. Just below the point where the spades deliver are six scuppets or boxes fixed on an axle, which receive the soil from the spades and tip or turn it over. There are two axles, one inside the other, and three scuppets attached to each, so that three receive, and three tumble together—the axles being partly turned and then back again in a rapid manner, by means of short levers at their ends actuated by two eccentrics on the opposite ends of the crank axle. Immediately preceding the spades, and close to the ground, is an axle turned by small wheels at its extremities running on the ground; this carries one row of six teeth like harrow tines, apparently designed to cut and separate the land into as many slices or stripes as there are spades, and thus render it looser and readier for digging. The spades measure about 9 inches broad across the upper part or shoulder of the blade, tapering downward like draining tools, but are very short. Their distance apart, measuring from the middle of each, is about 15 inches, and they rise and fall about 22 inches. The spur-wheel and pinion, connecting the crank-shaft with the driving wheel, can be slided out of gear by a lever.



In order for the spades to work, the progressive motion of the machine must be very slow indeed; and we presume that the inventor's design is to have a steam-engine upon this large frame, which shall work the digging machinery and propel the whole concern slowly forward, leaving the soil turned over and broken behind it. But we should say that, on loose sandy soil, the spades will either not lift the earth, or else let most part of it escape undug between them; and on land tenacious enough to rise up in huge spadefuls, the blades will be at once cracked or the shanks snapped off. The aspect of this engine is certainly calculated to alarm a quiet farmer; and in another part of the implement court is a model which, had it been constructed the full size of the machine, would be still more terrific. As a particular account of this instrument, accompanied by a correct likeness, has been published in the "Expositor," we shall be brief in our description. The "Archimedæan Agricultural Machine" was invented by D. J. Murphy, of the Chamber of Commerce, Cork, Ireland, and the main portion seems to consist of a large barrel, or roller, upon the surface of which fixed cutters are arranged in a spiral manner. These cutters may be either heart-shaped knives, radiating from the surface of the cylinder, with their flat sides towards its ends, and with conical spikes between the different rows; or of these knives in a direction at right angles to this; or a continuous blade may be curved round the cylinder like the thread of a screw—the different forms being for varying soils and purposes. The weight of the barrel sinks the knives into the ground, horses dragging it onward and causing it to revolve. It may be set by screws in its frame to greater or less depth. We should expect it, on trial, to be immediately clogged full of dirt; and all we have to say respecting the flaming account given by its explanatory handbill of the work it "will" perform, and the immense benefits it "will" confer upon the farmer is, that a satisfactory performance at Pusey would have recommended the machine far more effectually than the unwarrantable assertions of the placard hung upon it.

The first year of another half century can show many improvements in agricultural mechanics; but the wonderful tool that is to shame the ploughman and banish the plough is yet to be modelled in the great foundry of time.



In noticing the different coulter fastenings of the ploughs last week, we omitted one, viz., that on which a round shank, held between two pairs of studs or projections on a moveable plate beside the beam, is nipped by a staple and screw against a wooden wedge at its upper

end; the point is set forward, or otherwise, by turning the plate with screw; and more or less land is given by tapping the wedge in or out. This contrivance is very simple, and has a minimum of screws.

Harrows, which are the commonest implements of husbandry next to ploughs, occur but scantily in the exhibition: possibly because the forms produced for the last years by the best makers, especially those of Howard of Bedford, leave little room for novelty combined with improvement. The peculiar zigzag shape of Howard's harrows is well known, giving the utmost simplicity to the framing, with the least liability to clog; and the arrangement and fastening of the tines appear all that can be desired in this kind of implement. At Derby, York, and Exeter, the first prize of the Royal Agricultural Society has been gained by these harrows. At the two latter meetings they were shown with joints in the centre of each harrow, allowing them to adapt themselves to any unevenness of surface. We noticed also some admirable harrows, by Sanders and Williams of Bedford. They are patented: the general shape is just like Howard's, and the two outside bulls of each harrow are bent in the same way; but the rest traverse it diagonally, so that a greater rigidity of framing seems to be secured, and a village blacksmith may more easily mend it without making a "bull." The difference is here represented:

Howard's.

Sanders and Williams'.

In these figures, the harrows are hardly long enough in proportion to their breadth. Of wooden harrows we saw none. One exhibitor has a number of iron harrows hung together so as to cover a large surface, and furnished with short levers and small wheels, by pressing on any one of which a portion of the harrow is lifted to clear it from clods or weeds. A "Patent Four Wheel Harrow" is shown by A. F. Campbell; but we hardly know whether we ought not to class it as a grubber. It consists of two rows of teeth, in shape and fixture resembling those of Finlayson's harrow; the frame supporting them being slung by four parallel connecting bars from an iron framing upon two large wheels. This upper frame rises or falls in front by means of a lever sliding it up and down on a spindle from two small front wheels; and the frame carrying the teeth can be set higher or lower by a chain wound upon a small barrel with a ratchet. The excellence of the Norwegian harrow is sufficiently established: its rowels are exactly adapted for stirring as well as breaking cloddy land, and for keeping each other clear. Barrett, Exall, and Andrews, of Reading, show one with a simple apparatus for raising the rowel axles out of work, or *vice versâ*. The frame from which they hang may be said to be supported, when out of work, upon vertical levers, at the lower ends of which are the wheels, one in front and two behind. The frame is lowered by bringing these into a slanting position, the upper ends toward the horses. They are connected above and below the frame by parallel rods, and the movement is made by a crank with screw axle. Crosskill, of Beverley, also exhibits a Norwegian harrow, which is put in or out of work by levers at each side lowering or raising it upon its wheels. A spindle runs along the top from a crank or winch to the front of the frame, and by a worm working a toothed segment, sets the fore part of the machine more or less high above a small wheel. The implements generally cannot be taken as specimens of what are in daily use by English farmers, but are the very choicest yet invented, only some having come into extensive practice. For the wooden plough and wooden harrow, the commonest implements in the country are not to be found here, unless perhaps by a scrutinising search.

Of Rollers, there is scarcely to be seen one; certainly not one of the old wooden rollers employed by almost every farmer. Among this description of implements, Crosskill's Patent Clod-crusher undoubtedly stands unrivalled; its sharp points being as well adapted for pressing and dinting in Wheats as for breaking and pounding clods, while its loose rings shake out all dirt and cannot clog. But there are several others of great merit. S. Chenery, of March, Cambridgeshire, has invented a "land-presser," particularly adapted for the light peaty fen land, consisting of 15 large iron rings upon an axle, the section of the rim of each ring being thus ⊔, the flat circumference rolling upon the ground. Mapplebeck and Low, of Birmingham, show a roller or crusher which has two axles, one before the other, and carrying a number of rings with sharp or narrow rims. These rings are about 2 feet in diameter, and about 3 inches apart, working into or between each other. The two axles are braced together at their ends by two bars, upon the middle of which the shaft frame is supported by pivot joints. By this excellent arrangement, the frame bears equally upon each roller, and is free to follow the vertical movement of the horses; while the rollers can accommodate themselves to slight inequalities of surface without altering the position of the shafts.—The only implement, however, which appears likely to compete with Crosskill's is the Improved Clod-crusher, made by Pearce, of Poole, Dorsetshire. This consists of two axles carrying rings of a peculiar form. The rims are narrow or sharp, but instead of being straight are waved or vandyked, the edge, which is seen from behind the ring, appearing thus:— ⩛⩛⩛ One axle has ten rings, and the other eight working between them. The rings are 26 ins. in diameter; they are fixed upon square axles, but the centre wheel on each can revolve independently of the rest. As there is an intervening space of 4 inches between adjacent wheels, no clogging can easily ensue; and all the land is subjected to pressure, the clods slipping between the first row of wheels being caught by the second. As the resistance is thus not met all at once, it is supposed that the draught is lighter than it would otherwise be: the width covered is 6 feet, and on rough land, three or four horses are required. Not having points like Crosskill's, it does not need encumbrance and delay of plain wheels to carry to and from the field; and yet, its piercing and grinding power is supposed to be little short of what it would be, had the wheels been serrated. One of the principal objections to double rollers is their tearing up the soil in turning round: but a beautiful and simple contrivance obviates such a disadvantage in this implement. The horses can turn the shafts round without moving the main frame, so that the crusher is drawn backwards and forwards. The shafts are fastened to a flat iron ring or wheel, which rests upon another at the top of the frame; and the upper one with the shafts can slide round upon the lower one, a pivot passing through the centre of each, the movement resembling that of a chaise turning upon the axle of its fore-wheels. Two pins or bolts passing through both rings hold the upper one fast; and when it is required to turn, the pins are raised and withdrawn by two wedges on a bar slided by a lever. The shafts can be turned either way, and when in their right position, the pins drop again into the holes. The action is extremely easy; but the whole machine can be turned round, instead if the driver chooses.—As this number of our report contains an account of a steam plough and other outlandish instruments, it ought perhaps to comprise also all the notices of a similar kind. There is a model of a digging maching to which we may hereafter refer; and there is a model of "a steam and human-power cultivator, or universal tillage machine and irrigator," invented by C. Burcham, of Fincham, near Lynn, Norfolk. This appears to be a long gallery or shed, supported above the ground at one end by a sort of pivot, and at the other by an engine-house on wheels. A great number of men are stationed in a row along this gallery, each having charge of a lever shod at its lower end with something like a hoe. The idea seems to be that, while the engine moves the whole apparatus like the radius of a great circle around the pivot; these hoes or stirrers are to do, by the help of the men, what is required for the land. Along the opposite side of the machine a number of large scissors are designed, apparently for cutting corn. A circular index at the central pivot tells the quantity of ground passed over. *I. A. C.*

[*Erratum.* The last three lines of the first column, on page 298, ought to have been the *first* three lines of that column.]

## Home Correspondence.

*Drainage Act.*—It might be of considerable advantage to some of your subscribers, if any person having borrowed money of the commissioners appointed under the Drainage Act would detail the expense of his proceedings. The printed paper of the commissioners states that applications for money are to be made "in the form furnished."—"As soon as they are entertained (but not until the end of two months after the last advertisement thereof in the *London Gazette* and local paper) the case is, on the request of the applicant, referred to an inspector, who is to inspect all the land proposed to be drained, and to report to the commissioners upon the general scheme of drainage, and if approved by them an application is made to the Treasury to authorise the issue of a provisional certificate." The printed directions state "that the greatest caution is necessary in furnishing an accurate description of the lands to be drained by an extract from the title deeds, or by a plan of the estate; for works executed on lands not included in the provisional certificate cannot in any case be allowed." Let us stop here to enquire what expense has been already incurred by this first inspection? Whether the commissioners have approved the inspector's report, or if they have not approved it—such report, be it recollected, stating that the property will be increased in value for letting, equal to an increased rent, for the money proposed to be laid out. The printed directions say, "the drainage has to be executed, in the first instance, at the expense of the applicant; but when any portion of the works which are complete in themselves has been executed to the satisfaction of the inspector, he certifies the amount expended to the commissioners," and they "being satisfied with such a report, issue a certificate of advance for the amount specified." Now, here we want to know the expense of such second inspection for work done, be it remembered, at the cost and advance of the proprietor, before he can demand any reimbursement, although the commissioners shall "have entertained the application" in the first instance. Now, so much of the work done is to be inspected; being finished, how is this accomplished, with pipes necessarily laid down, and earth filled in, to meet the term finished and done? "Another, and another, and another" visit from Mr. Inspector must occur before the total reimbursement is to happen, and the commissioners advise that it is very desirable that certificates of advance should not be required for very small sums, as it is necessary that all works should be examined and certified by an inspector, which must necessarily be attended with expense." These after proceedings "to the entertained application" raise our fear, "the dread of something after death" alarm our seeking it. The proprietor having to advance the money, and perform the task before remuneration comes, strips the loan of half its value, it being mostly wanted to set the thing going. The repayment of principal and interest in 22 years, by an annual payment of 6½ per cent. on the capital borrowed, is liberal and unobjectionable, but the appendage of lawyers, inspectors, and a host of unseen spectres, "puzzle the will, and make us rather bear the ills we have, than fly to others we know not of." Therefore I presume to ask the detail of expenses from some of the initiated of your correspondents. *A Tenant for Life.*

*Management of Small Farms.*—In your Paper of the 5th inst., you ask for any information as to management of small farms. I claim nothing original in my system; perhaps there is much that, to more scientific minds, may appear objectionable. Every farm, however, must be judged by its own peculiar circumstances. I have only a small proportion of arable land to about 26 acres of Grass. My object is to raise as much winter food as possible, and therefore look to green crops more than to corn. Carrots I grow in large quantities in the kitchen garden; consequently, valuable as they are, they are not included in the field culture. I give a sketch of the cropping &c., for 1850-51, of the four fields, if I may call pieces of an acre each by such a name, into which my arable ground is divided. No. 1. 1850. Cabbages cut in September. The leaves, sprouts, &c., fed off with sheep folded, then ploughed and sown with black Barley, which is now about to be fed off by ewes with fattening lambs, to be then immediately dug, heavily manured and sown with Mangold Wurzel. No. 2, 1850, Mangold, having been deep trenched previous winter. Manure forked in in the spring, 3 cwt. of superphosphate put in at same time as seed, produced 32 tons per acre, now under Wheat, which promises very well. No. 3, 1850, Wheat, 36 bushels per acre. Now winter Vetches to be eaten off by sheep, fed at same time with corn and oil-cake, then dug and sown with Swedes, or hybrid Turnips, manured with guano or superphosphate. No. 4, 1850. Part winter Vetches, followed by Swedes; all vacancies filled up with Kohl Rabi, the larger roots drawn off to fattening cattle, the smaller ones and tops fed off by sheep, which received at same time ½ lb. of Oat chaff (half Oaten straw and hay), *ad libitum*. This piece was heavily manured in January, ploughed deep, and is now under Drumhead Cabbage. The other part of No. 4, 1850, black Barley and spring Vetches, followed by partly Rape and partly Thousand-headed Cabbage planted out from seed-bed in August, fed off this spring by sheep, then deeply ploughed, and now having manure forked in, to be sown with Mangold next week. The sheep which have been living on this Cabbage are now folded on a warm paddock, fed with Mangold, Oats, and oil-cake, and so being made quickly ready for the butcher. The Grass of this paddock, which will be forced by the manure of the sheep, and liquid manure also, will be cut for soil, and keep some young steers in yards, while the meadows are up in May and June. *Henry Milward, Paulton Vicarage, Bristol, April* 10.

*Facts relating to a Fourteen-acre Field, drained* 4 *feet deep.*—Happening to return from the town of C— one frosty evening in December, about 7 o'clock, when a close mist hung over the whole country, I passed by the gate of my field—the moon being near the full—when thinking I would turn through the field, instead of following the road, to look at a few sheep that I had wintering there, I took to the field, when I was instantly gratified by one of the most striking sights I had ever witnessed; for I had not ventured 10 yards from the fence of the road within the area of the drained field, before the mist disappeared. The moon shone cold and clear; and I stood in a clear space of 14 acres, as if in a vast bowl or crater, surrounded by white walls of mist, indescribably beautiful. The first impression was one of astonishment, succeeded by one of satisfaction, that I had before my eyes the plainest phenomena of the results of draining. The other incident is as follows: We had in January a fall of snow, which covered the ground, say three inches deep; on the third day after it had fallen, while the whole country was still white, I took a walk to see how the drains were running, when to my surprise I found that not a yard of the field was covered with snow; it was all melted, save a little on the west side, where the main drain runs 7 feet deep, thus giving me the satisfactory hope that the field is prepared to receive the first advances of the smiling spring. *R. W.* [We should be glad to receive the further communication you propose.]

*Open Furrows on Drained Land.*—In reading Mr. Paine's reply to Mr. Mechi's observations on the necessity of making surface drains, or open furrows, on thorough drained land, it seemed to me that Mr. Paine has founded his opinions on the experience of tolerably level land; but that Mr. Mechi had alluded to steep hilly fields. I can agree with both: for I cannot imagine any clay land so porous (even after expending upon it in draining such a sum as 16*l.* per acre!) as to absorb instantaneously such rain as we have recently experienced, provided the field be a steep fall. Some

12 or 14 years since, I shallow drained with tiles and soles a Grass roadway of stiff London clay. I took up the tiles last week, finding the water standing on the surface continuously; the tiles were empty—indeed the water had flowed to them freely on piercing the clay with a wire; but though the drains were only 4 yards apart, the land was puddled. I believe that the necessity for the contiguity of drains depends as much upon the rapidity of the inclination, as it does on the depth or on the nature of the soil. *I. E. G.*

*Rotation of Crops for a Cottage Plot of Land.*—Divide the plot into three parts; let the first be trenched in the autumn, 18 inches deep, placing a good coat of manure 9 inches below the surface, and plant it with early Cabbages, which should be sufficiently forward to be cut in time for a crop of late Potatoes to be put in, in the spring; which may be succeeded by Wheat or other grain the second year. In the third year a crop of early Potatoes, followed by a crop of Turnips, may be taken, and the rotation commence again by trenching and manuring. If the production of roots is preferred to that of grain, Mangold Wurzel or Carrots may be substituted; or Broccoli might be planted instead of the Turnips in the third year, if the crop could be removed in time. *T. W., Boxley.*

*Hedgerow Trees.*—One of your correspondents, in the last Number, proposes that the landlord shall pay his tenants a shilling per annum for all the trees on the farm more than 10 years old! Why, there are many finely cultivated farms in Warwickshire and Worcestershire, where the sum to be paid by the landlord would exceed the rent, under such a proviso. *An Enquirer.*

*Farm Manure and Lime.*—There are but few practices in farming which have been more condemned than the applying manure and lime at the same time, and yet none has so often resulted in a good crop of Turnips, as far as my limited observation has extended. Upon a strong clay soil in the neighbourhood of Leeds, last year, I saw a most splendid crop of Swede Turnips; and as good crops were rare, I asked how they had been managed, and was told that after being manured from the farm-yard, they had been limed, and sown with 2 cwt. of guano, sown broadcast on the same day, the guano being sown before closing the ridges. In a field of our own, containing a good deal of iron and clay, my father sowed Swede Turnip, after manuring with night-soil and lime, both put on in the same day; it was one of the best crops we ever grew, and though very large, they were all planted for seed, and to prove that the plan had not exhausted the manure, the crop of seed was the heaviest I ever remember to have seen. Not to mention other examples, the only good crop in our neighbourhood last year was on strong land, managed on the same plan. Now, every one knows that to mix fresh lime in a manure heap, or with a heap of guano, would be to injure it, but if, as Professor Way has proved, clay and iron have such an affinity for ammonia, where is the danger of placing fresh lime and manure in contact with them, as they would be in strong soils; may it not be a good plan to render manure more immediately available for the crop? Does not strong land require the manure to be so prepared, and is this not the reason? We have found bone of little or no use here, and yet dissolved bones have had the best effect on the same land. I think I have seen somewhere stated, that a farmer found bones, dissolved in acid, of little use, unless the land had been previously limed. I believe the kind of land was not stated; if strong, was it not from the raw, unprepared, state of the manure, and was not lime required to convey away the acid, and leave the phosphate in a state proper for the crop? Whilst on the subject of lime, can any of your readers say what per cent. a soil must contain when it ceases to be advisable to apply it, and what is the minimum quantity a good soil ought to yeild on analysis. Is it necessary to apply quicklime to soil containing a good proportion of lime in the state of carbonate? and if the subsoil be rich in carbonate of lime, will deep ploughing be sufficient for the wants of the field? As these questions are in dispute here, the discussion of these subjects, will give much pleasure to some of your constant readers. *J. R. P., Chilwell.* [Read the chapter on Lime in Prof. Johnston's Lectures on Chemistry.]

*Open Furrows.*—Improved agriculture cannot admit of open furrows; their existence, at any time, can only be defended as the less of two great evils. Wherever land has been properly drained, or wherever it does not require draining, in all such cases open furrows are an abomination which no logic can defend; but wherever land has been improperly or unscientifically drained; or wherever, from some cause or other, land does not admit of being drained, though it greatly requires it, there, in such places, open furrows, as the less of two evils, may, or must, be tolerated, but in no other case. Some few years since I troubled the *Agricultural Gazette* with some observations on draining, and the chief object I had in view was to induce farmers to get rid of the necessity of open furrows. I am aware, that whatever I may write on this, or any other subject connected with the cultivation of land, has but little weight with many readers, because I cannot boast, as some writers have done, of being a farmer of 800 or 1000 acres of land. But I wish my friends to know, that my parish consists of nearly 3000 acres of arable land, under the plough; and that nearly every field in it is as much under my observation as if the whole were in my own cultivation; I think, therefore, that I could not be in a better condition for the forming of a correct judgment upon any matter of land cultivation were the whole of my parish in my own occupation, and perhaps not in so good a condition for this. But before I sent my observations to the press, I put the principles I advocate to the test on my own land. Fourteen years since, when I took possession of the land I occupy, I found it in stitches with open furrows at every 2 yards of intervals. The land was then full of water, and water stood all over it; as often as it rained, also, nearly the whole of the rain-water run off the land down the open furrows, washing away with it the essence of the manure held in solution, and with that the sand out of the soil; thus, at every shower the land was deteriorated and the manure wasted. But I set to and drained my land in my own way; but, and as I have often advocated, I made my drains, on an average, full 5 feet deep; and since then my land is become one large filterer; all the water passing through it into the drains below, how much so ever may fall in a given time on it; and it empties itself from the drains as clear as crystal. I add, also, that the subsoil of my land is a stiff clay; and yet this land is in good working condition always, and may be ridden over or walked upon with pleasure at any time, and at all times. Surely, then, it would be a mark of insanity in me to leave open furrows on my land to carry off all the fertilising rain-water, and with it the sand out of the soil, and the essence of the manure put on it also! But I have some other land, lately come into my possession, and not drained, and that is now as wet as land can well be; and, consequently, on that, until I can drain it, as the less of two sore evils, I would leave open furrows; but I will get rid of this nuisance, and the necessity for it, and put deep and proper drains into that land on the very first opportunity I may have. I am aware, Mr. Editor, that some persons have said that I ought to employ myself better than in the amusing the world with my agricultural doings; but I have the consolation of knowing that many farmers are following the example I have set them; and that, in my parish, three farmers in 49 seeded their lands, on an average, with just one Winchester bushel of Wheat an acre, and that the produce on one of the farms was nearly 6 quarters an acre, that of another 5 quarters an acre; and I have no doubt but the produce of that on the third will be quite as much as that of the others: but it is not yet threshed. I add, also, that those three farmers have reduced their seed corn still lower this year, and that I have seen a fine field of Wheat on one of their farms, which was drilled last autumn with a little over 2½ pecks an acre; and I add, also, that all the farmers in this neighbourhood, since I have been resident in it, have considerably reduced their quantities of seed-corn; and I feel satisfied with considerable profit to themselves, and at a benefit to their country. And I add further, that throughout the whole of my experience, the more intelligent I have found farmers to have been, the deeper and better they have drained their lands; the deeper and better they have ploughed it, and the less seed-corn have they used. Let me, also, ask the advocates of open furrows, if market gardeners, who pay 5*l.*, 6*l.*, 8*l.*, or 10*l.* an acre for land, use them? and if they are not all of them thin-seeders? For example, ask the intelligent Mr. Cuthill this question. *G. Wilkins, April* 22.

*Rotation of Crops for Allotments.*—One of your correspondents a few weeks ago asked for information on this head; and as no answer has appeared in your columns, I offer a few suggestions. I assume that the circumstances of these allotments are similar to the generality of others; that they differ from the farmer's occupation by a higher rent, and the tenant's having a greater command of labour and manure. It is clear then that there must be proportionate increase of produce, and, to effect this, the land, during the growing season, must never be without a crop upon it. Also, when the farmer sows, the cottager, to save time, must often transplant such crops as Mangold Wurzel and Swede Turnip. Besides this, he must aim at growing what he wants to consume himself, instead of buying and selling. I will endeavour to illustrate my meaning by a couple of examples of rotations for three and five years. In the spring of the first year of the three years' rotation Potatoes were grown. In the autumn after the crop is raised, abundance of dung is forked in, and, in October, winter Beans are dibbled in rows three feet apart. At the same time Cabbage Coleworts sown July 1, or early Cabbages sown August 1, are planted in rows, between the Beans. The open space is well hoed when the state of the ground will allow. The Coleworts will be off by the beginning of April, and Mangold Wurzel takes its place, sown in the last week of that month; or, if the intervening crop be Cabbages, they will be off by the end of May, and Mangold Wurzel transplanted when the thickness of a man's thumb. At the end of November the Mangold Wurzel will be removed, and the land well manured and forked 15 inches deep, before the end of December. In the beginning of the following April, Belgian Carrots are sown in rows 15 or 18 inches apart, which will occupy the ground to the end of the third year. The five years' rotation is as follows:—Potatoes—winter Beans, Cabbage, and Mangold Wurzel—Wheat—winter Beans, Cabbage, and Swedes—Carrots, Longpod Beans planted in January, may be used instead of winter Beans in October. Also between the winter Beans, early Cabbage and the Drumhead may be set alternately, the former off in spring, and the latter to remain until autumn, instead of a crop of Mangold Wurzel. The capabilities of the land, and the wants of the cultivator, will determine what crops are to be grown. *Sigma.*

*On Turnips and Mangold Wurzel.*—For Turnips, according to general opinion and experience, sandy soils and loams are considered most applicable; such as the coast of Norfolk, where they are cultivated under the four-course shift, which, in fact, first took its rise in that county, brought over originally from Flanders. It is, as well as other regular systems of cropping, open to objection, and it is now much varied according to convenience. Since the great advantages derived from artificial manures, the method generally in favour is, to drill the Turnips with bone-dust and ashes (as in Lincolnshire), or else dissolved, forming a superphosphate, which last plan is the best, and brings the young plant up rapidly into broad leaf, taking care to have plenty of ashes, say five loads per acre, with the bones; and, lastly, to first well dress the land with farm-yard manure, which sends along the Turnip after it has imbibed the goodness of the bones, and remains some time in the land, to the benefit of the succeeding crop. With the best management, Turnips are perhaps more than any other crop dependant upon season, which, if a dry one, may, from the ravages of the fly, take them off, and frustrate the labour and expence of the farmer. If early sown, we think it should be very early; why not in the month of April? [Too early a maturity in the south of England will generally be attended with mildew.] For Swedes at all events (if the land can be prepared in time); they would thus get, perhaps, the benefit of showers for forcing them on, if April is true to its character; whereas May, the general time chosen, is often a dry month, sometimes frosty in the mornings. June, again, is often, of late years particularly, a showery month; in two succeeding years (from a diary kept) 1847 and 1848, nearly half the month was of that character; in the first year the showers began about the 10th of the month, continuing about 10 days, sometimes nearly every half hour; in the next named year the rain came in later, about the 15th or 20th, and kept on through the month. I would therefore, almost rather sow in June, if May is inclined to be dry, especially in high situations, but if possible, by way of experiment, in April. A good course of cultivation is after Rye: for example, instead of the old system of ploughing up your Wheat stubble, and leaving it fallow till Turnip time (nearly a year). Sow Rye (manured) as soon as possible, after the stubble has been well got rid of, feed it off in April, about the first fortnight, if possible; bring the ploughs in whilst the sheep are on the Rye, and drill the Turnips with artificial manure, having some Vetches for the flock to go on, after the Rye is fed. Another system of double fold may be after Mangold Wurzel folded off on the land. A third may be (for late Turnips) after Vetches fed off, and the whole brought to Wheat. A word with respect to Rye and Tares; these are particularly useful when Turnips are over, before the natural pastures are ready; and what no farm should be without yearly. I was surprised during a residence in the Lincolnshire Wolds (a county celebrated for high farming), to observe the almost total want of these crops; so that after the Turnips were out, there was often positively little or nothing for the sheep to go on—perhaps a few seeds or Clover, but on those hills not very forward. Again, the Wheat stubbles, as I before remarked, were there, as in some other districts, left till Turnips, with no intervening crop. It is by attention to these matters that high farming is produced; nor can we think a district worthy of the name of a high farmed one which neglects these attentions to sufficiency of artificial sheep feeding year by year. There seems a difference of opinion as to which contains the most "proof"—Swedes or Mangold Wurzel. The fact seems to be, that Swedes and common Turnips are best for fatting beasts during the three winter months, and yellow globe Mangold Wurzel to finish them with in spring as a change, cut up with steamed chaff, sprinkled with Bean meal or other preparations. Mangold Wurzel, different from Turnips, likes a rather strong deep land, and likewise differs as to its cultivation, that is, according to the present system pursued by our best modern agriculturists. I believe Mr. Huxtable was the first who introduced dibbling the seed in with a pint of manure upon it: this was then tried by Mr. Graburn, agent to the Dean of Windsor, at Butleigh, and to the Earl of Fortescue in Devonshire, and has been already described in your Journal by Mr. Mechi, in his "Trip to North Devon." We think, however, if he had likewise paid a trip to Tringweston (near Somerton) to Mr. Dickenson's farm, managed by his agent, Mr. Gray, he might have made nearly equal materials for an interesting report, both as regards the culture of Mangold and of farming in general. Mr. Gray partly took his system from Mr. Graburn; and when with the former I sent reports as to its working, which are alluded to I find in Mr. Acland's prize Report of the Farming of Somersetshire, in the Society's Journal. The following was the estimated expense of the planting as pursued, and also of drilling, if it had been pursued, by way of contrast, showing the advantage of the former by 15*s.* over the latter in cheapness:

| | | | |
|---|---|---|---|
| 6 men with long dibbles, at 1*s.* 8*d.* per day | £0 | 10 | 0 |
| 6 women with manure-baskets, at 6*d.* | 0 | 3 | 0 |
| 6 children with seed, at 4*d.* | 0 | 2 | 0 |
| Horse with manure-cart, at 3*s.* | 0 | 3 | 0 |
| | £0 | 18 | 0 |

Doing 2½ acres per day, at about 8*s.* per acre.

For drilling would be:

| | | | |
|---|---|---|---|
| 2 men and boy with drill, at 1*s.* 8*d.* and 1*s.* | £0 | 3 | 8 |
| 1 with harrows | 0 | 1 | 8 |
| 4 with manure carts | 0 | 6 | 8 |
| 7 horses, at 3*s.* | 1 | 1 | 0 |
| | £1 | 13 | 0 |

Performing about 6 acres per day—difference, 15*s.*

For dibbling 20 acres (2½ per day) at 18s. ... £7 4 0
For drilling ditto .6 acres per day) at 1l. 13s. 4 18 0

So that in following it on, the speed of the drill renders it in the end cheaper, when performing the work in large quantities; as to matter of time, but then this apparent counter-advantage is again lost, by the deterioration of the crop, the roots being smaller and more irregular than when planted, for it stands to reason that seed placed on manure in each hole, must exist on it and thrive better than what catches hold of the manure from the drill by chance. This plan answers for Swedes, and might be carried out for Turnips; that is, where there are plenty of hands. The manure used for the Mangold should be large quantities of nearly equal portions of good farm-yard manure and ashes (common, and peat, if procurable); if handy, scourings of drains are useful to wet the ashes with; the dung and ashes are mixed well together with forks, which is best done by a heap of each side by side near to where the planting is to take place, done by rapid turning with the forks. After it is all well mixed, haul out your superphosphate bags, and shoot them out over the whole, mix well together, and it is ready for use; pint tin cups are the best for depositing it in the holes, which should be 27 by 14 inches apart. The best way is to mark out the rows with the drill previous to ridging up for them. A light roller finishes the work; transplanting can be performed, where necessary, after the plants are up, and hand and afterwards horse-hoeing, will come into the course of management. From 2 to 4 cwt. of superphosphate of lime should be used, which it appears answers better than guano, particularly in a dry season, and more likely to be unadulterated. Indeed, the former seems to have superseded the latter, at all events for Turnips, for which bones seem a necessary food for it to exist. It is extraordinary to see the difference in some Swedes manured and unmanured upon our home hill; those with bones are first-rate, as fine as one would desire; those without, literally not larger than marbles, both being on the same land, very shallow, in fact, hard on a limestone rock. To complete the experiment another time, some with farm-yard manure should be tried, so as to have three varieties—boned, manured, and no manure. *H. E.*

*The Lark.*—It must be admitted that the song of birds is among Nature's choicest gifts, and those only who have listened to the "charm of earliest birds" in full chorus, can form an idea of the stream of melody poured forth from hundreds of happy throats when they first wake up beneath the curtains of some shady grove:

The lark begins the lay
Ris ng the nearest Heaven,
His tribute there to pay
From whence his joy was given.

Then we have the notes of the nightingale, the thrush, and the blackbird, alternating with those of the smaller warblers, relieved at intervals by the soft cooing of the dove. Having often enjoyed this varied harmony, I must say a word in favour of the poor lark, although a tiller of the soil. Shall I boldly assert that he does no harm? No. Shall I suppress the fact that I have often seen him nipping off the young blades of Wheat? No. What then? What then! Why he ought to be shot—says the destructive. Stop a bit; if put in at a proper depth, in proper soil, he will not injure the part below the coronet, and in a short time one or more shoots will spring up again. But even if it were otherwise, you should reflect that this world "and all that it inherit" were not made for you alone, and that you have no right to destroy off the face of the earth every one of God's creatures that does not immediately minister to your convenience. However, let your principles be fully carried out. Away with all restrictions, class interests, and conscientious scruples. Contemplate first of all the extirpation of the whole race of that hard-billed villain the sparrow, who will have his allowance of corn both at seed time and harvest, in spite of gun and rattle. Then suppose the clouds to have fallen, in order that all the larks might be taken at one fell swoop, for eating it in the blade. Then pass an act for the abolition of rookeries, upon the plea of their being general feeders, and living on the plunder they obtain from the neighbouring fields. Next trap and shoot all blackbirds, thrushes, starlings, &c., for eating your fruit. Then set a price on the heads of chaffinch, greenfinch, *et id genus omne*, for levying contribution on your Turnip and Radish seed; and when all the larger tribes are disposed of in a satisfactory manner, set innumerable steel traps for the extirpation of tomtits, and bring summary ejectments against jenny wrens for taking possession of your haystacks without permission. Now reckon up the number of nuisances you have got rid of: sparrow, lark, rook, crow, blackbird, thrush, dove and ringdove, chaffinch, greenfinch, and bullfinch, hedge-sparrow, robin, and tomtit, are only a few of the most conspicuous offenders who have received orders to depart this life, and henceforth to keep company with the shade of the "last of the Mohicans" and other proscribed races. The idea is almost suffocating, but it is done, and another year is come. "How are things now? What do I hear you say? Your plant of Wheat is very gappy. How is that? There are no larks now?" "No, but there are plenty of grubs." "Oh! it's the grubs now, is it?" "Yes." "Well, what sort of a show of fruit have you got?" "Oh, I had a splendid blossom and the frosts kept off nicely, but soon after the fruit was set it fell off." "Indeed, how was that?" "Why I suspect that some caterpillars which I found in the fallen fruit were the cause of its falling off." "What a pity!" "Yes it is, I assure you, quite a blight to my expectations, after all the pains I had taken to extirpate those vermin." "Then probably you are worse off after all than you were before you got rid of those nuisances." "I really think so." "And you have had no whistle?" "None but my own." "Then you pay rather dearly for that." *F. J. Graham, Cranford.*

*The Acre.*—At page 268, third column, of your number for Saturday, April 26, there is a comparison between the English and Irish acre, stating the former at 4840, and the latter at 7840 square yards, respectively. The difference is stated to be 300 square yards, instead of 3000 square yards; this is evidently a typographical error, but it should be corrected. It is requested to give the contents of "the Cunningham and Plantation acre, the Cornish, Cheshire, Scotch, and others." I know nothing of any of these, except the last, which is as follows:—The Scotch acre consists of 5760 square Scotch ells. The Scotch ell is 37⅓ inches. By reducing 5760 square Scotch ells to inches, and fifths of inches, and by division bringing them into English measure, we have 6150⅔ square yards, as the contents of a Scotch acre in English measure. By the above, the Scotch acre would appear to be more than one-fourth larger than the English; that is, 4 Scotch acres are equal to 5 English acres, and a little more. The little more amounts to 100⅔ square yards in the above quantity. *J. G.*

*A Few Words on the Fallow System*—That great benefit has been derived from fallows, whether plain or made in the intervals of growing crops, no one who has had any practical experience in farming will for a moment doubt, but that the profits of farming have been very much increased since naked fallows gave way to green crops, is equally well known to the farmer. So very palpable have been the benefits resulting from the alternate system of cropping, that in districts where fallowing used to prevail as a general rule, it is now found to be laid entirely aside. It has been, and continues to be, the aim of every good farmer, to have his land brought into that condition, often obtained at great outlay, in draining, subsoiling, and liming, which will enable him to dispense with fallowing. But the deduction that the atmosphere will supply to the soil the means of replenishing it with matter sufficient to admit of cereals being grown in succession, without manure, ought to be received with great caution. Liebig's theory of supplying the mineral ingredients of a crop only, having proved a complete failure, neither will the most complete comminution of the soil enable it to produce a full crop, if the necessary quantity of food for the plant has been withheld. On light lands, the yield of corn has been found to be in some instances one-sixth greater, when drilled at 6 inches, than when drilled at 12. *J. D. B.*

## Notices of Books.

*Notes on North America, Agricultural, Economical, and Social.* By James F. W. Johnston, M.A., F.R.SS. L. and E., &c.

This is especially a book for the intending emigrant. He desires to know the agricultural capabilities of the localities among which his choice is wavering; and in reference to that large tract of land, partly under British and partly under American rule, which lies immediately south of the St. Lawrence, he will here find them given in great detail. It is impossible for us to give, by means of extracts, any idea of the way in which this part of the performance is accomplished. It must suffice to say, that Professor Johnston went to New Brunswick, with the special view of reporting upon the agricultural capabilities of that province, and that both there and during his travels through the States, he had all the advantages which long practice in travel, and in agricultural criticism, must give an observer. The connection of the varying geology of the districts visited—always much more obvious in land which as yet owes nothing to art—is traced with such minuteness as to furnish a key which will be useful even in localities unvisited by our author. The verdict regarding the character of the soil is, however, given not only from its geological and botanical indications, but also from the numerous instances of farm practice and experience of which he was witness.

But an intending emigrant not only wants to know the character of the climate and soil of his future home—he would also benefit greatly by possessing some of the experience of those who have already tried the experiment on which he is about to venture; and in no particular will these volumes be more useful than in the records they furnish of success and failure attending different lines of conduct in the colonies.

The following extracts show that industry there as elsewhere is the sure road to success:

"With one of these settlers, John M'Lean, I had an interesting conversation; and as his history may interest some of my readers also, as an example of the way in which steady industry overcomes difficulties, and secures comparative prosperity in a new country, I shall state the leading facts I gathered from him. He came over in the year 1822. He has 250 acres in his farm, of which 150 are cleared; but he has not force to keep all this land in crop. He works it with the aid of three of his sons, two daughters, and three horses—keeps eleven cows, eight or nine young cattle, and a few sheep. He bought his land in the wild state, cleared it all himself without hired labour, and has *raised* eleven children. He has four sons settled on farms, one of whom paid 150*l.* for his farm; two of them worked as carpenters till they had saved money to buy their farms. Neither he nor any of his children ever lumbered, nor should any of them if he could help it. Not one in twenty makes anything by lumbering; and by sticking to their farms, men in the long run always make a better living, and are more independent, than by anything else. Many others who came out with him, and since he came, have stuck to their farms, and have done as well as himself. Though the crops have failed so many years, few in this settlement are in debt. Oatmeal porridge and milk twice a-day, and oatmeal cakes, are the prevailing diet. Odds and ends, as he called sugar, tea, &c., are obtained by the sale of butter and cheese.

"Mr. M'Lean thinks a man would do well in Northumberland, who could come over with 50*l.* in his pocket, and better with 100*l.* But he ought not to have too much, if he is to labour contentedly, and to prosper. He had himself only 5*l.* when he settled, besides three carts and a year's provisions. If these statements of Mr. M'Lean are got by heart by the intending emigrant to the wilderness parts of North America, he will require little other guidance to comfort, prosperity, and contentment."

"Lumbering," we should say, is speculating in the timber trade; going to the wilderness, and cutting it; carrying it to the river, and floating it down to the shore for the merchant: it is a pursuit attended with many risks as to its reward; and with this sure certainty, on the other side, that the wild reckless sort of character, which it engenders, is altogether incompatible with the patient industry of the farmer's life.

The intelligent emigrant desires, however, to know many things beside the mere possibility of earning a livelihood in the locality to which he is bound. Its social condition; the nature of the laws under which he will live; the taxes which will be laid upon him; the nature and habits of society around him, are all points of great interest; and they are all fully detailed with reference to New Brunswick and the Northern States of North America.

To the agricultural reader this Journal of Professor Johnston will be especially interesting, independently of its instructions for the emigrant, for the information it gives on the agricultural statistics of North America; and to the general reader, for the instructive comparison it draws between Great Britain and some of the States, especially in reference to Taxation and Public Instruction.

METEOROLOGICAL REPORT.—May.
(*Continued from page* 301.)

| Date. | Time. | Max. | Min. | Wind.—Weather. |
|---|---|---|---|---|
| May 5 | 6.25 a.m. | ... | 29.63 | Brisk breeze NW. all day, |
| * | 4.10 p.m. | ... | 29.63 | barometer steady; at 6 |
| | 10.30 p.m. | 29.67 | ... | p.m. wind veered to N., and barometer began to rise. |
| 6 | 7 a.m. | ... | 29.71 | NNW. all day. Blowing hard |
| | 10.10 p.m. | 29.78 | ... | in the morning; noon, gentle. |
| 7 | 7.5 a.m. | 29.78 | ... | WSW. to SW. Gentle breeze, |
| | 10.20 p.m. | ... | 29.72 | and fine day. |
| 8 | 6.45 a.m. | 29.63 | ... | SSW. a.m. Blowing hard. |
| | 10.20 p.m. | ... | 29.47 | S. p.m. Moderating at sunset. |
| † 9 | 7 a.m. | ... | 29.44 | S. a.m. Gentle breeze. |
| | 8.5 p.m. | 29.49 | ... | SE. noon; p.m. increasing. Densely overcast and raining fast. |
| | 10.40 p.m. | 29.47 | ... | Very wet night. |
| 10 | 6.55 a.m. | ... | 29.40 | SSE. a.m. Overcast, raining fast. |
| | 9.55 p.m | 29.55 | ... | Gentle breeze at south all the afternoon, and fine, no rain having fallen since noon. |
| 11 | 7.50 a.m. | ... | 29.58 | NW. Gentle, fine, and sunny. Noon, NNE., raining fast. Frequent showers throughout the day. |
| | 11.10 p.m | 29.68 | ... | Sunset, very heavy appearance in SE. |
| 12 | 8.5 a.m. | ... | 29 76 | N. Moderate breeze. Dull |
| | 10.40 p.m. | 29.99 | ... | day. |
| 13 | 6 a.m. | ... | 30.09 | NE Brisk breeze. Fine |
| | 10.40 p.m. | 30.18 | ... | day. |
| 14 | 6 a.m. | ... | 30.20 | N. Brisk breeze, and |
| | 11 a.m. | 30.21 | ... | ENE. Beautiful day. |

* This storm also would come from the westward, and pass away to north-east, having its track at a considerable distance to the westward.

† This storm came from the westward, over Spain or southern France. Possibly heavy westerly gale off Lisbon.

‡ Barometer falling with a southerly wind, and rising with a northerly one, *i.e.*, the storm coming from the south of west, and passing off to north of east; and as it moved off to the eastward, the wind drew round after it.

Dorchester, May 15th. *F. P. B. M.*

(*To be continued.*)

## Calendar of Operations.

MAY.

Dorset Farm, *May* 12.—Since last report we have been engaged in rolling the corn, and ploughing, and otherwise preparing for the root crops. Some of the land we have rolled with Crosskill's clod-crusher, and part with a heavy wooden one; and we have found the former very useful in breaking the surface of the land after the heavy rains that we had. Although for the past fortnight the weather has been cold, still the Wheat looks well, as it was previously strong; and now that we have had some warm rain, succeeded by mild weather, I think we may expect a fair crop. Barley, where it was sown early, looks well, as it was somewhat advanced before the cold set in; but where it was late, as it has been in many places, it is rather backward. The same may be said of Oats. As Flax has been greatly recommended as a profitable crop, we have this year tried a small piece which we sowed about 16 days ago. We are now engaged in sowing Mangold Wurzel, which we put on the baulk or ridge. One plough forms the drill; the dung is carried out, spread, and covered in, each operation being performed as close to the other as possible, so that the dung does not get time to dry. We sow about 20 acres of them, and find them a very useful crop; they have this year kept quite sound, and, as we lost some of them last year, we attribute it to cutting off the tops when they were taken up. It will often happen that, in the hurry of taking off the tops, they are cut too close, and then decay is sure to take place; but if

hey are twisted off, there is no danger in this respect, and the one way is as easily done as the other. Grass is plentiful, and the hay crop promises well. We have still a quantity of Swedes for fatting oxen. They were carried off the field in February, and covered over with a little loose straw in long heaps, about 6 feet wide, as high as they would pile up, and they are quite fresh up to the present time. The sheep are eating Vetches, and by day run in the ewe-leaze; they have been very healthy, and the lambs do well. The markets for fat cattle are still very low, but mutton has revived a little and is in demand. Pork is low and little sought for. *G. S.*

## Notices to Correspondents.

AGRICULTURAL SOCIETY'S PRIZES: *J N Wales.* They are awarded by the judges, and the award is announced immediately on its being made. The awards are generally made before the July meeting.

DRAINING TILES: *W Hewitson.* Thanks for the model. The drawing seems to have been correct enough.

LAMMERMUIR SHEEP FARMING: *A Young Sheep Farmer.* In answer to your first query—"What is the principal disease to which hogs in the Lammermuirs are subject?" the answer is the same which appears to be your greatest scourge on the Cheviots, "sickness," a malignant, inflammatory fever, apparently the same malady known on the Continent as *Sang de rage*, very rarely cured, the first visible symptom generally being to find the animal dead. 2d. "What loss have your neighbours sustained during the past year?"—This we cannot answer positively. Many men will not tell their losses, or only speak of them in the general as very heavy, moderate, light, &c. We know of two cases this winter, where the loss from "sickness" has been about 10 per cent., and the third, where it has been about 5 per cent., but from a different cause. In these instances the hogs received Turnips. 3d. What we generally lost previous to following the custom of covering them with flannel jackets? Since occupying in this district, with the exception of the first year, we have used jackets, and our annual loss has never exceeded 5 per cent. in any year, the average being about 3½ per cent. Our predecessor at one time suffered severely from "sickness," when the hogs were "hirseled" separately. He then changed his system. The stock ewe hogs were kept from the ewes some two or three weeks after being weaned, and then brought back, most of them taking up with their dams, and keeping beside them all the winter. After adopting this plan, except during some of the "bad years," when many died from poverty, his loss was very trifling. We continue to manage ours in the same way, and, as far as we recollect at present, have in no year lost above half a score from "sickness." We believe wherever this system has been followed it has been attended with similar results. We will not presume to assert that jacketing will of itself prevent this disease, but we will say, that these covers, from their non-conducting properties, strengthen the constitution, and improve the general health, such being confessedly the best safeguards against every malady. *A Lammermuir Sheep Farmer*

PAINT: *B B*, in reply to "Brush's" inquiry regarding Carson's anti-corrosion paint for inside work, informs him that he has used it for the inside walls of a greenhouse, a hothouse, and also of a church, the latter of which were exceedingly damp; and although it did not wholly prevent or destroy the moisture, it succeeded better than any other previously used. For the back walls of a greenhouse, &c., "B. B." can confidently recommend it, but would advise a greater proportion of turpentine with the oil than is used for outside painting.

# Markets.

### COVENT GARDEN, MAY 17.

Hothouse Grapes are plentiful and cheap, and the same remark applies to Strawberries. Pine-apples are more abundant. Dessert Apples chiefly consist of American Newtown Pippins. Oranges and Lemons are plentiful. Nuts remain nearly the same as last week. Vegetables of all kinds are abundant and good. Large supplies of Asparagus, young Carrots, French Beans, and Green Peas have been received during the week from France, Cucumbers from Holland, and considerable quantities of Potatoes and Asparagus from Cornwall, as well as some good Gooseberries; the latter fetch 1s. to 2s. per pottle. New Potatoes may be obtained at from 4d. to 6d. per pound; old kinds realise better prices. Lettuces and other salading are sufficient for the demand. The best Mushrooms fetch 1s. 3d. per pottle. Cut flowers consist of Heaths, Pelargoniums, Camellias, Mignonette, Double Primroses, Stephanotis floribunda, Cinerarias, Moss and Provins Roses.

**FRUIT.**

| | |
|---|---|
| Pine-apples, per lb., 8s to 12s | Oranges, per doz., 9d to 2s |
| Grapes, hothouse, p.lb., 5s to 10s | — per 100, 6s to 14s |
| — Portugal, p.lb., 1s to 2s 6d | — Seville, p. 100, 7s to 14s |
| Strawberries, per oz., 6d to 1s | — — p. doz., 1s to 2s 6d |
| Pears, per doz., 2s to 5s | Chestnuts, per peck, 2s to 5s |
| Apples, dessert, p. bush., 6s to 10s | — per 100, 9d to 1s 6d |
| — kitchen do., 5s to 8s | Nuts, Barcelona, p. bsh, 20s to 22s |
| Almonds, per peck, 6s | — Brazil, p, bsh., 12s to 14s |
| — sweet, per lb., 2s to 3s | Cobs, per 100 lbs., 50s to 55s |
| Lemons, per doz., 1s to 2s | |

**VEGETABLES.**

### HOPS.—FRIDAY, May 16.

Messrs. Pattenden and Smith report that the demand for all good Hops continues brisk, and that the supply on offer is unusually small for the time of year. The young bine is still in a very unkind and backward state. Late prices are fully supported.

### HAY.—Per Load of 36 Trusses.

**SMITHFIELD, May 15.**

| | | | |
|---|---|---|---|
| Prime Meadow Hay | 75s to 84s | Clover ... ... ... | 70s to 85s |
| Inferior ditto... ... | 55 70 | Second cut ... ... | 70 80 |
| Rowen ... ... ... | 55 65 | Straw ... ... ... | 26 30 |
| New Hay ... ... ... | — — | | J. COOPER. |

The supply large, and trade heavy.

**CUMBERLAND MARKET, May 15.**

| | | | |
|---|---|---|---|
| Prime Meadow Hay | 75s to 84s | Inferior ... ... ... | 65s to 75s |
| Inferior ditto... ... | 60 68 | New Clover ... ... | — — |
| New Hay ... ... ... | — — | Straw ... ... ... | 28 32 |
| Old Clover ... ... | 80 88 | | JOSHUA BAKER. |

**WHITECHAPEL, May 15.**

| | | | |
|---|---|---|---|
| Fine Old Hay ... | 75s to 80s | New Clover ... ... | —s to —s |
| Inferior ditto ... | 60 65 | Inferior ditto... ... | 70 75 |
| New Hay ... ... ... | — — | Straw ... ... ... | 26 30 |
| Old Clover ... ... | 88 92 | | |

### COAL MARKET.—FRIDAY, May 16.

Holywell, 14s.; Eden Main, 14s. 6d.; Wallsend Riddell, 13s. 6d.; Wallsend Hurton, 13s 6d.; Wallsend Hetton, 15s. 6d.; Wallsend Stewarts, 15s. 6d.; Wallsend Tees, 15s. 3d.—Ships at market, 34.

### POTATOES.—SOUTHWARK, May 12.

The Committee report that the market continues to be well supplied both coastwise and per rail. Trade is heavy, and for most samples less prices have been submitted to. The following are this day's quotations:—York Regents, per ton, 80s. to 100s.; Scotch do., 70s. to 85s.; ditto Cups, 65s. to 80s.; Catholics and whites, 60s. to 65s.; Cambridge Regents, 50s. to 70s.; French whites, 60s.

### SMITHFIELD, MONDAY, May 12.

We have a very large supply of fine oxen, and the trade for them is exceedingly dull. A few choice Scots still make 3s. 6d., but on the average prices are lower, and many remain unsold. There is also a considerable increase in the number of Sheep and Lambs; contrary to general expectation, the demand is small, and although there is a disposition to take lower rates, they cannot all be sold. Trade is very dull for Calves at less money. From Holland and Germany there are 510 Beasts, 1510 Sheep, 198 Calves, and 60 Pigs; from Norfolk and Suffolk, 3000 Beasts; and from Scotland, 600.

| Per st. of 8 lbs.— | s | d | s | d |
|---|---|---|---|---|
| Best Scots, Herefords, &c. | 3 | 4 | to 3 | 6 |
| Best Short-horns | 3 | 0 | — 3 | 4 |
| 2d quality Beasts | 2 | 2 | — 2 | 8 |
| Best Downs and Half-breds | 4 | 0 | — 4 | 4 |
| Ditto Shorn | 3 | 6 | — 3 | 10 |

| Per st. of 8 lbs.— | s | d | s | d |
|---|---|---|---|---|
| Best Long-wools | 3 | 8 | to 4 | 0 |
| Ditto Shorn | 3 | 2 | — 3 | 6 |
| Ewes & 2d quality | 3 | 0 | — 3 | 6 |
| Ditto Shorn ... | | | | |
| Lambs ... | 5 | 0 | — 5 | 8 |
| Calves ... | 2 | 8 | — 3 | 10 |
| Pigs ... | 2 | 8 | — 3 | 6 |

Beasts, 4718; Sheep and Lambs, 29,230; Calves, 268; Pigs, 410.

**FRIDAY, May 16.**

There is a more cheerful trade for Beasts to-day, but prices are no better on the average. The supply of Sheep and Lambs is not large, but quite adequate to the demand. Prices have advanced a little, owing to the dead markets being clearer. We have now so few Sheep in the wool we cease to quote them. Trade is still dull for Calves; however, a few choice ones have made 4s. From Germany and Holland we have 98 Beasts, 650 Sheep, and 231 Calves; from Spain, 100 Sheep; from Scotland, 200 Beasts; from Norfolk and Suffolk, 400; and 107 milch cows from the home counties.

| Per st. of 8 lbs.— | s | d | s | d |
|---|---|---|---|---|
| Best Scots, Herefords, &c. | 3 | 4 | to 3 | 6 |
| Best Short-horns | 3 | 0 | — 3 | 4 |
| 2d quality Beasts | 2 | 4 | — 2 | 10 |
| Best Downs and Half-breds ... | | | ... | |
| Ditto Shorn ... | 3 | 8 | — 3 | 10 |

| Per st. of 8 lbs.— | s | d | s | d |
|---|---|---|---|---|
| Best Long-wools ... | | | | |
| Ditto Shorn ... | 3 | 4 | — 3 | 6 |
| Ewes & 2d quality ... | | | | |
| Ditto Shorn ... | 2 | 8 | — 3 | 2 |
| Lambs ... ... | 5 | 0 | — 5 | 8 |
| Calves ... ... | 2 | 8 | — 4 | 0 |
| Pigs ... ... | 2 | 8 | — 3 | 6 |

Beasts, 924; Sheep and Lambs, 7690; Calves, 421; Pigs, 410.

### MARK LANE.

MONDAY, MAY 12.—The supply of English Wheat this morning was moderate, and readily disposed of at the extreme prices of last Monday. A fair amount of business was transacted in foreign at that day's rates. Flour was held for an advance of 6d. to 1s. per sack.—Barley was in fair request, and its value well supported.—The arrivals of Oats have exceeded 49,000 qrs. The sale to-day was not so brisk as on Friday last, but the improvement of 6d. per qr. obtained at the close of last week was maintained.—Beans and Peas must be quoted 1s. dearer.

FRIDAY, MAY 16.—There was a very short supply of English Wheat at market this morning, and Monday's quotations were readily obtained. The receipts of foreign Wheat exceed 14,000 quarters; holders were firm in their demands, and former prices were realised.—There was no alteration in the value of English Barley; foreign being in good supply, was obtainable on rather better terms than on Monday.—We have again to report rather large arrivals of foreign Oats; the demand, however, being good, the dealers were unable to supply themselves cheaper than on Monday.—Beans and Peas remain firm.

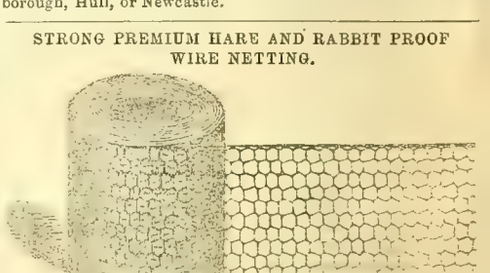
LIVERPOOL, TUESDAY, MAY 13.—The supplies of grain and Flour from Ireland and coastwise are again very small, whilst the exports to those places are large. This morning's market was well attended, and fresh Baltic Wheat sold readily at fully the prices of this day se'nnight. Old foreign Wheat moved tardily, and prices were slightly weaker. On Friday American Flour improved 6d. per barrel, but this could not be maintained to-day; we had, however, a fair demand for all good sound qualities, of American and French, at quite as good figures as on Tuesday last. Spring corn and pulse all supported the late advance, and the quotations of this day week are raised 6d. per qr. on Indian Corn and Beans, 1d. per bushel on Oats and Barley, and 3d. to 6d. per load on oatmeal.—FRIDAY, MAY 9.—The Corn Exchange was well attended this morning by millers and dealers. There was a good tone in the trade generally, and some substantial sales were made of Wheat and Flour at very fully the rates of Tuesday; in a few instances a small advance was made on American Flour. Indian Corn also commanded extreme prices. The best mealing Oats being still scarce, went up to 3s. per 45 lbs., which is an advance of 1d. per bushel, and Oatmeal improved 6d. per load. Egyptian Beans were in request, and 6d. per qr. higher. Barley scarce, and 1d. per bushel dearer.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Alobert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

THE METALLIC PAINT, produced by the Patent Alkali Company, has been extensively used for several years on farm-buildings, iron bridges, roofs and railings, shipping, &c., and it is admitted that it covers a greater surface and stands far better than any other pigment on wood, iron, Abethaw Lime, and Roman Cement. Fine Black, 25*l.* per ton, and Rich Purple-brown, 20*l.* per ton.—Offices of the Company, 1, New Broad-street, London.—JOHN A. WEST, Secretary.

GALVANISED WIRE GAME NETTING.—
7*d.* per yard, 2 feet wide.



| | Galvanised. | Japanned Iron. |
|---|---|---|
| 2-inch mesh, light, 24-inch wide ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch ,, strong ,, ... | 9 ,, | 6½ ,, |
| 2-inch ,, extra strong ,, ... | 12 ,, | 9 ,, |
| 1½-inch ,, light ,, ... | 8 ,, | 6 ,, |
| 1½-inch ,, strong ,, ... | 10 ,, | 8 ,, |
| 1½-inch ,, extra strong ,, ... | 14 ,, | 11 ,, |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG AND COMPANY (LATE W. AND C. YOUNG),
MANUFACTURERS OF IRON AND WIRE WORK, &c.,
22, PARLIAMENT-STREET, WESTMINSTER, LONDON;
48, NORTH-BRIDGE, EDINBURGH;
32, ST. ENOCH-SQUARE, GLASGOW;
1, CASTLE-BUILDINGS, DERBY-SQUARE, LIVERPOOL;
beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

PRICES.—18 ins. high, 9*d.*; 24 ins., 1*s.*; 30*s.* ins., 1*s.* 3*d.*; and 36 ins., 1*s.* 6*d.* per lineal yard.

| | | |
|---|---|---|
| Or a web of 100 yards, 18 ins. wide, will cost | ... | £3 15 0 |
| Do. of 100 yards, 24 ins. wide | ... | 5 0 0 |
| Do. of 100 yards, 30 ins. wide | ... | 6 5 0 |
| Do. of 100 yards, 36 ins. wide | ... | 7 10 0 |

If more or less than a web is required, it would be charged at the same rate per yard.

This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has in many instances been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. YOUNG and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1*s.* is equal to 2½ yards of another article in the market, the same width, at 9*d.* per yard. Samples for inspection sent free of expense.

C. D. YOUNG and Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland.

"WHERE SHALL WE GO THIS MORNING?"—Such is usually the query over the breakfast-table with visitors to London. Let us answer the question. If you can admire the most beautiful specimens of Papier-Mâché manufacture which are produced in this country, displayed in the most attractive forms—if you want a handsome or useful Dressing Case, Work-Box, or Writing-Desk—if you need any requisite for the work-table or toilet—or if you desire to see one of the most elegant emporiums in London, then you will go to MECHI'S, 4, LEADENHALL-STREET, near the India House, in whose Show Rooms you may lounge away an hour very pleasantly.

## SALES BY AUCTION.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will submit to public competition, by Auction, at the Mart, Bartholomew-lane, on THURSDAY, May 22d, at 12 o'clock, a first-rate collection of DAHLIAS, consisting of all the approved kinds, the newest varieties of Fuchsias, Verbenas, Heartsease, &c.; a fine assortment of Geraniums, and other plants in bloom, and a quantity of useful and ornamental plants for bedding. May be viewed the morning of sale.—Catalogues had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

MR. LAWRENCE'S GRAND SHOW OF TULIPS for Sale by Auction on FRIDAY, the 30th inst., will be on view at the Red Lion Hotel, Hampton, Middlesex, until the day of Sale.—Catalogues, now ready, to be sent to all applicants by post, and at the principal Seed Shops.

ORCHIDS FROM VERAGUA—COLLECTED BY MR. WARSZEWIZ.

MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King-street, Covent-garden, on TUESDAY next, 20th inst., at 12 for 1 o'clock, a consignment just received, containing fine healthy plants of Cypripedium caudatum, Trichopilia suavis, and many new species.—May be viewed the morning of sale, and Catalogues had.

ORCHIDS FROM AFRICA.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King-Street, Covent-garden, on TUESDAY next, the 20th inst., an importation from Sierra Leone, well deserving the attention of all growers of Orchids. The Plants being in every respect superior to any yet received from that locality; it includes Angræcum caudatum. A. bilobum, a new Angræcum, and several other new species, and some fine Ferns.—On view the morning of Sale, and Catalogues had.

ORCHIDS.—THE MOST IMPORTANT EVER OFFERED TO PUBLIC SALE.

MR. J. C. STEVENS is favoured with instructions to submit to Auction, at his Great Room, 38, King-street, Covent-garden, on MONDAY, June 9th, and following day, a collection of ORCHIDS, that has ranked for some years past as one of the finest in the kingdom; it comprises magnificent Specimen Plants, in perfect health, of all the favourite varieties, an enumeration of a few of the principal of which will suffice to show the high character of the collection.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

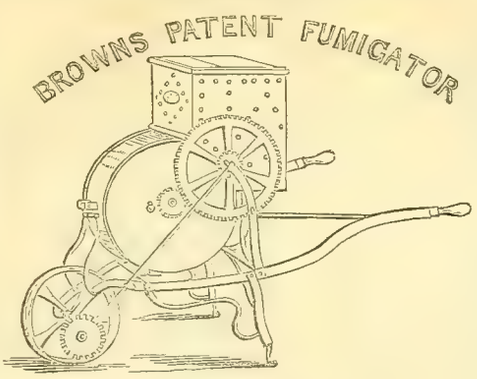
Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

TO GARDENERS AND OTHERS SEEKING A CHEAP CONCERN.

TO BE LET, within four miles north of London, with immediate possession, a COTTAGE, containing four Rooms, with a Garden, where a good ready-money Plant business has been done, and which may be improved. The Show and Propagating Houses, and two Greenhouses, to be taken at a valuation. Rent, including taxes, 18*l.* per annum. Apply to Mr. GEORGE RUTHERFORD, Brook-street, Upper Clapton, near London.

TO BE SOLD, Three beautiful yearling thoroughbred JERSEY BULLS. They are from the purest prize stock, brought over two years since by the gentleman who bred both the Bull and Cows whilst resident in the Island. He now offers the three beautiful yearlings for 20 guineas each. They will prove particularly valuable for crossing with the Ayrshire, Short Horn, or Devon.—Apply by letter, post-paid, to T. I., M.D., Wood Hall, Hilgay, Norfolk.

ZOOLOGICAL GARDENS, REGENT'S PARK.—AN ELEPHANT CALF and its Mother have been added to the Collection, and are EXHIBITED DAILY, together with the HIPPOPOTAMUS presented by his Highness the Viceroy of Egypt. The Band of the First Life Guards will perform, by permission of Colonel Hall, at 4 o'clock, on Saturday, May 17, and on every succeeding Saturday, until further notice. Admission, 1*s.*; on Mondays, 6*d.*



BEE HIVES, as shown at the GREAT EXHIBITION of 1851, by GEO. NEIGHBOUR and SON, 127, High Holborn, London. No. 1, Nutt's Collateral Hive; 2, Improved Single Box-Hive; 3, Taylor's Amateur Bar-Hive; 5, NEIGHBOUR'S Improved Cottage Hive, working three or five Glasses; the Ladies Observatory Hive, &c. &c.

A priced Catalogue, with drawings and particulars, forwarded on receipt of two postage stamps.

AGENTS.—Liverpool: Wm. Drury, Castle-street. Manchester: Hall and Wilson, 50, King-street. Glasgow: Austin and M'Aslin, 168, Trongate.

IMPORTANT TO FARMERS, GARDENERS, FRUIT, AND HOP GROWERS.

"The skilful farmer, chaff
And blazing straw before his orchard burns
Till all, involved in smoke, the latent foe
From every cranny suffocated falls."
THOMSON'S SEASONS.

BY means of this instrument, the smoke produced by burning refuse vegetables can be directed in a cool state upon Agricultural Drilled Crops, or upon Wall or Standard Fruit Trees, Hops, &c., and blight or insects destroyed. It is also available for filling large houses with Smoke of Tobacco or other material; disinfecting impure places in ships and buildings; and for eradicating vermin. The machine may be obtained with or without the drilling apparatus.

Manufactured by Messrs. DEANE, DRAY, and DEANE, Swan-lane, London.

Price 6*d.*, free by post.

REMARKS ON FUMIGATING HORTICULTURAL AND AGRICULTURAL CROPS.

London: Published by BRADBURY & EVANS, Bouverie-street.

DO YOU BRUISE YOUR OATS?

BEWARE OF SPURIOUS IMITATIONS.

The only GENUINE of each bears the name of "ROWLANDS'," preceding that of the article on the Wrapper or Label.

Sold by A. ROWLAND and SONS, 20, Hatton-garden, London; and all Chemists and Perfumers.

HOLLOWAY'S PILLS, A CERTAIN SPECIFIC FOR NERVOUSNESS, LOWNESS OF SPIRITS, AND DISORDERED STOMACHS.—The wonderfully regenerating effects produced by these invaluable Pills are truly astonishing. This fine Medicine acts in so peculiar a manner on the system, that by following the directions affixed to each Box as to the mode of using it, nervous irritability is allayed, the tone of the stomach strengthened, the digestion improved, freedom of circulation given to the blood, and a robust state of health attained. Persons of studious and sedentary habits being more especially liable to the class of disorders alluded to, should take HOLLOWAY'S Pills, to insure a good state of health.—Sold by all Druggists, and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

BEDSTEADS, BATHS, and LAMPS. In a few days, WILLIAM S. BURTON will OPEN THREE LARGE ADDITIONAL SHOW-ROOMS, communicating with his original ones (which are the largest in the kingdom), devoted exclusively to the SEPARATE DISPLAY of Lamps, Baths, and Metallic Bedsteads. The stock of each will be at once the largest, newest, and most varied that has ever been submitted to the public, and will be marked at prices proportionate with those that have tended to make his establishment the most distinguished in this country.

| | |
|---|---|
| Bedsteads, from ... | ... 12*s.* 6*d.* to 12*l.* each. |
| Shower Baths, from ... | ... 7*s.* 0*d.* to 7*l.* each. |
| Lamps (Palmer's), from | ... 1*s.* 6*d.* to 6*l.* each. |
| (All other kinds at the same rate.) | |
| Palmer's Candles ... | ... ... 6½*d.* per lb. |

WILLIAM S. BURTON'S Stock of General Furnishing Ironmongery is literally the largest in the world, detailed Catalogues of which, with engravings, sent (per post) free. The money returned for every article not approved of.—39, Oxford-street (corner of Newman-street), Nos. 1 and 2, Newman-street, and Perry's-place, London. Established in Wells-street, 1820.

DEAFNESS.—New Discovery.—THE ORGANIC VIBRATOR; an extraordinary, powerful, small, newly-invented instrument, for deafness, entirely different from all others, to surpass anything of the kind that has been, or probably ever can be produced. It is modelled to the ear, so that it rests within, without projecting. Being of the same colour as the skin, it is not perceptible. Enables deaf persons to enjoy general conversation, to hear distinctly at church and at public assemblies. The unpleasant sensation of singing noises in the ears is entirely removed, and it affords all the assistance that possibly could be desired. Invaluable newly-invented Spectacles, Powerful Telescopes, Opera and Race Glasses; also a curious, very small, powerful, Waistcoat-pocket Glass, only the size of a Walnut, to discern objects at the distance of four or five miles.—S. and B. SOLOMONS, Aurists and Opticians, 39, Albemarle-street, Piccadilly, London.

THE BLOOD.—Our bodies have been entirely formed, *are now forming, and will continue to be built up during life from the blood. What the sap is to the tree the blood is to the animal frame: and inasmuch as the strength and verdure of a tree are dependant on the moisture derived from the root, the health and vigour of the body are indispensably connected with a pure and free circulation of this important fluid. It is this that must feed the flame of existence; and unless its replenishments are freely and purely communicated, the vital fire becomes clouded, burns dimly, and is ultimately extinguished. The grand object is to keep this precious fluid (the blood) in a pure and healthy state, for without this purity, disease will show itself in some way or other.*

PARR'S LIFE PILLS.

*It is universally admitted that this medicine will purify the blood better than any other, and will conquer any disease.*

None are genuine unless the words "PARR'S LIFE PILLS" are in WHITE LETTERS on a RED GROUND, on the Government stamp, pasted round each box; also the fac-simile of the signature of the Proprietors, "T. ROBERTS and Co., Crane-court, Fleet-street, London," on the directions.—Sold in boxes at 1*s.* 1½*d.*, 2*s.* 9*d.*, and family packets at 11*s.* each, by all respectable medicine vendors throughout the world.

METCALFE AND Co's NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1*s.* An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co's, Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.

CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

ALLSOPP'S EAST INDIA PALE AND OTHER BURTON ALES.—The Public is respectfully informed, that these favourite Ales may be had genuine, in casks of 18 gallons and upwards, at their respective stores, as under where also a list of the bottles may be obtained.

The Brewery, Burton-on-Trent; Stores, 61, King-William-street, City, London; Cook-street, Liverpool; High-street, Birmingham. The Exchange, Manchester, 33, Virginia-street, Glasgow.

WHAT WILL THE JAY SAY?

*In the press,*

EVERY LADY'S GUIDE TO HER GREENHOUSE. Small 8vo, price 2s., cloth, gilt.

London: WM. S. ORR and Co., Amen-corner.

Recently published, in 1 vol. 8vo, price 9s.,

THE SABBATH; or, an Examination of the Six Texts commonly adduced from the New Testament, in Proof of a Christian Sabbath. By a LAYMAN.

Also, by the same Author, 8vo, price 1s.,

THE MOSAIC SABBATH; or an Inquiry into the Supposed Present Obligation of the Sabbath of the Fourth Commandment.

The Author's object in the two works above mentioned is not to discountenance the religious observances of the Sunday. It is to show that this salutary institution is of human and not directly of divine origin; consequently that it cannot be a sin against God to do work on that day, and that the attempt of the over-righteous among us to put down all work whatever, however useful, on the Sunday, is, on any religious grounds, wholly unjustifiable.

OPINIONS OF THE PRESS ON "THE SABBATH."

"A very able disquisition on this subject."—*Westminster Review* for October 1850.

"A very elaborate controversial, critical, and minute examination of the Six Texts which are supposed to justify Sunday observance.

"This is a calmly-reasoned, well-written work, composed in a spirit worthy of the solemn theme it treats."—*Economist* of June 29, 1850.

OPINIONS OF THE PRESS ON "THE MOSAIC SABBATH."

"An able pamphlet, well deserving public attention."—*Westminster Review* for October, 1850.

"Here is a little treatise of 50 pages, which completely and for ever settles the whole question, and which has all the rigorous demonstration that the question admits. We cordially commend this treatise."—*The Leader* of September 14, 1850.

London: CHAPMAN and HALL, 193, Piccadilly.

Just published, price 6d.,

GLENNY'S GOLDEN RULES FOR GARDENERS, Professional and Amateur; showing in a few words what Gardeners ought to do and avoid.

GLENNY'S GARDEN ALMANAC and FLORIST'S DIRECTORY for 1851, price 1s., contains a Calendar of Garden Operations for the whole year, a List of the best Show Flowers, Fruit, and Vegetables, a List of new Flowers to come out in the Spring, Valuable Hints to Lady Gardeners, and other useful information.

GLENNY'S PROPERTIES of FLOWERS and PLANTS. New edition, with additions by the Author, price 1s.

GLENNY'S GARDENING for COTTAGERS, price 6d., with Treatises on the Management of Bees, Poultry, Pigs, &c.

London: CHARLES COX, 12, King William-street, Strand.

COLONISATION OF IRELAND.

This day is published, with a Map, post 8vo, 9s. 6d.

THE SAXON IN IRELAND; Or, the RAMBLES of an ENGLISHMAN in search of a SETTLEMENT in the WEST of IRELAND.

"A curious and significant book is this,—a rare sign of the times,—a record pregnant with strange and mighty matter for thought."—*Atlas.*

"A valuable testimony to the capabilities of Ireland for English emigration."—*Observer.*

"This is one of the most calm, considerate, and conciliating records of travel and observation in the sister country, that have come under our notice. It has an air of truth and reality which leads us at once to accept its statements."—*Athenæum.*

"Whoever wishes to see Ireland through an impartial lens, will read the lively account given by the Saxon."—*The Globe.*

"The descriptions are pains-taking and accurate. Based on geological observations, they are peculiarly calculated to be useful to intending settlers."—*Daily News.*

"Let the intending emigrant devote a few hours only to the perusal of this volume before he decides. The work possesses a far deeper interest than even could be claimed for it from its fascinating descriptions."—*Illustrated News.*

"Replete with good plain common sense; it will be a great help to persons seeking to settle in Ireland."—*Economist.*

"A remarkable book—the work of one who has purchased land in the Sister Isle, preferring it to a distant colony."—*News of the World.*

45, Lime-street, May 24. J. W. JEWITT, Hon. Sec.

## PELARGONIUMS.

EDWARD BECK having withdrawn from exhibiting publicly, begs to intimate that his Collection of this favourite flower is now in bloom, and open for inspection, Sundays excepted. N.B.—The various articles in slate manufactured by him, may be seen at the same time.—Worton Cottage.

## CHOICE AND CHEAP.—READ THE FOLLOWING!

(Carriage paid; see below.)

Now ready, and may be had gratis on application,

MAY'S DESCRIPTIVE CATALOGUE OF PLANTS, for ornamenting the Flower Garden, and Greenhouse display.

N.B.—All orders above 2*l.* 10*s.* carriage paid to London, or to any Railway Station within 150 miles of the Nurseries, and plants given over on smaller orders to compensate for carriage. Our central position and great facility of railway communication enables us to execute all orders with punctuality and despatch.

The Catalogue comprises the following favourites, viz.:—Calceolarias of the best sorts, Cinerarias, Fuchsias, Scarlet Geraniums (for bedding), Verbenas—the very choicest varieties, Petunias, fine Chrysanthemums for autumn display, Liliputian Chrysanthemums (these are little gems, growing about a foot high, and flowering profusely), Salvias, Heliotropes, Phloxes, new and fine; Antirrhinums, fine; various Plants adapted for Bedding, Climbers of sorts, and Roses in selection.

| | *s.* |
|---|---|
| ERICAS, 12 fine blooming plants, own selection, per doz., 12 | |
| GREENHOUSE PLANTS, 12 miscellaneous sorts, blooming, our own selection, per doz. ... ... ... ... 12 | |
| HERBACEOUS PLANTS, in pots, purchaser's selection, per 100 ... ... ... ... ... ... ... ... 63 | |
| Do. do. do., our own selection, per 100, 50 | |

The list throughout is divided into sections of the newest and best in each class, and those in more general cultivation; the selection is left to purchasers or ourselves, in the latter case our customers may rely upon our integrity in furnishing good articles, for which we have received many flattering testimonials. Every information given on application.

Address, JOHN MAY, Hope Nurseries, near Bedale, Yorkshire, to whom all Post-office orders must be made payable.

## READ THIS!

ROBERT WHIBLEY wishes to purchase some Seed from choice kinds of PRIMULA SINENSIS FIMBRIATA.—The first and second parts of his Catalogue are ready, and can be had on application.

Nursery, Kennington, London.

## THE BEST EARLY TURNIP FOR FIELD CULTURE.

SUTTON'S EARLY SIX WEEKS. A field of these Turnips, grown by Mr. E. W. Moore, Steward to Earl Radnor, on poor soil, at Coleshill, gained the 20*l.* prize at the Farringdon Agricultural Show in 1849.

JOHN SUTTON and SONS confidently recommend the above for first sowing, to feed off for Wheat.

*Also, for succession, the New Lincolnshire Red, and* SUTTON'S *Purple-topped Hybrid yellow Turnip.*

The Lincolnshire Red Turnip (the stock of which was presented to Messrs SUTTON, in 1849, by Philip Pusey, Esq., M.P.), should be fed off before Christmas; and SUTTON'S Purple-topped Yellow Hybrid, which is equal to a fine Yellow Swede. May be sown very late with certainty of success, and will keep till spring either in the field or housed.

Sold in quantities of not less than 10 pounds weight, at the undermentioned prices, *Carriage Free*, to any Station on the Great Western, South-Western, or South-Eastern Railways:—

| | Per pound. *s.* *d.* | per gallon. *s.* *d.* | per bush. £ *s.* |
|---|---|---|---|
| Early Six Weeks' Turnip ... | 0 10 | 5 0 | 1 16 |
| Sutton's purple-topped Hybrid | 1 0 | 6 0 | 2 4 |
| Lincolnshire Red ... ... ... | 1 0 | 6 0 | 2 4 |
| Ashcroft Swede ... ... ... | 0 10 | 5 0 | 1 16 |
| Skirving's Liverpool do. ... | 0 9 | 4 6 | 1 10 |
| Best Dwarf Rape ... ... ... | 0 4 | 2 0 | 0 12 |

SUTTON and SONS, Seed Growers, Reading, Berks.

Agents for the sale of Rivers's Stubble Swede Seed.

"THE FLOWER OF THE DAY" may now be seen in bloom at J. AND C. LEE'S NURSERY, HAMMERSMITH. Price, per dozen, according to size, on application.

AZALEA INDICA "SYMMETRY" (KINGHORN), will be sent out on 1st June, price 21*s.* Discount to the trade.

## TWENTY THOUSAND FLOWERING PLANTS

OF CRASSULA COCCINEA MAJOR FOR SALE, well set with spikes of Flowers, in pots from 4 to 18 inches in diameter, and with flowering heads varying in number from one to one hundred on a plant. This is a very desirable plant for bedding, and flowering plants can be supplied from 4*s.* per dozen to four guineas per plant, on application to J. W. THOMSON, Nurseryman, Landscape Gardener, and Hothouse Builder, Exotic Nursery, Hammersmith, Middlesex.

EDWARD GEORGE HENDERSON is now prepared to forward his new SPRING CATALOGUE for 1851, post free on application, and it will be found to contain all the new Stove and Greenhouse Plants, new Geraniums, Fuchsias, Cinerarias, Verbenas, Chrysanthemums, soft-wooded and other Plants, sent out in this country or on the Continent. Much pains have been taken to render the descriptions full and correct, so as to make it a guide to purchasers.

E. G. H. also solicits attention to the new Plants he is now sending out, as will be seen on referring to page 64 of the Catalogue.

Wellington-road Nursery, St. John's Wood, London, May 24.

CHRYSANTHEMUMS, "QUEEN OF ENGLAND," "CLOTH OF GOLD," "RABELAIS," "JENNY LIND," "POMPON D'OR," "THE WARDEN," &c. &c.

CHANDLER AND SONS, NURSERYMEN, Wandsworth-road, are now sending out the finest Chrysanthemums from 9*s.* to 12*s.* per dozen. The newest varieties 1*s.* 6*d.* each. Good sorts for planting in open borders, 6*s.* per dozen.

Post-office orders payable at Kennington-cross.

## SPLENDID NEW SEEDLING FUCHSIAS.

WILLIAM RUMLEY AND SONS are now sending out the under-mentioned superb SEEDLING FUCHSIAS, which they can confidently recommend as first-rate varieties.

VOLTIGEUR.—Tube and sepals pure waxy white, with rich deep rose corolla, large, and finely reflexed; 5*s.* each.

NORTHERN BEAUTY.—Tube and sepals white, slightly tinged with rose, deep rosy carmine corolla, well expanded; 3*s.* 6*d.* each.

New Rose-coloured GERANIUM "ROSEA PERFECTA."—Deep rosy pink, with pure white centre, good shape, and very distinct; 2*s.* 6*d.* each.

Having a splendid stock of the undermentioned in first-rate varieties, we can supply them at the very low prices affixed.

FUCHSIAS, all the best of 1850, 20 for 10*s.*; 12 for 7*s.* 6*d.*; or 6 for 4*s.* For the varieties, see our advertisement of April 19.

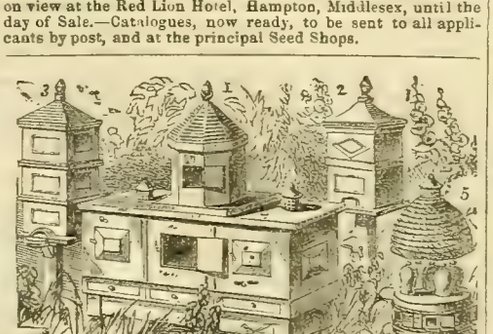
R. MARNOCK.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY AND ORMISON, Danvers-street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which for elegance of design, good materials and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen, and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

MR. LAWRENCE'S GRAND SHOW OF TULIPS for Sale by Auction on FRIDAY, the 30th inst., will be on view at the Red Lion Hotel, Hampton, Middlesex, until the day of Sale.—Catalogues, now ready, to be sent to all applicants by post, and at the principal Seed Shops.

BEE HIVES, as shown at the GREAT EXHIBITION of 1851, by GEO. NEIGHBOUR and SON, 127, High Holborn, London. No. 1, Nutt's Collateral Hive; 2, Improved Single Box-Hive; 3, Taylor's Amateur Bar-Hive; 5, NEIGHBOUR'S Improved Cottage Hive, working three or five Glasses; the Ladies Observatory Hive, &c. &c.

A priced Catalogue, with drawings and particulars, forwarded on receipt of two postage stamps.

AGENTS. — Liverpool: Wm. Drury, Castle-street. Manchester: Hall and Wilson, 50, King-street. Glasgow: Austin and M'Aslin, 168, Trongate.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

WARRANTED BEST MATERIALS AND WORKMANSHIP, AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

GREENHOUSE AND CONSERVATORY BUILDING ESTABLISHMENT, HOT-WATER APPARATUS MANUFACTORY, KENSALL-GREEN, HARROW-ROAD, LONDON.

JOHN TAYLOR begs most respectfully to call the attention of the Nobility, Gentry, and Gardeners, to the very superior manner in which he erects all kinds of Greenhouses, Conservatories, Forcing Pits, &c., and all other buildings for Horticultural purposes, combining all the most modern improvements with elegance and utility. His manner of heating Horticultural Buildings, Churches, Chapels, Public Buildings, Entrance Halls, &c., has received the greatest approbation from the Nobility and Gentry by whom he has been extensively engaged.

LIGHT, CHEAP, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT, an inodorous felt for damp walls, sold in rolls 32 inches wide, 1d. per square foot; also dry Hair Felt, for preventing the radiation of heat and deadening sound, and Sneathing for ships' bottoms, on which the copper lies smooth. Samples, directions, and testimonials, sent by post.—CROGGON and Co., Dowgate-hill, London.

ZOOLOGICAL GARDENS, REGENT'S PARK.—AN ELEPHANT CALF and its Mother have been added to the Collection, and are EXHIBITED DAILY, together with the HIPPOPOTAMUS presented by his Highness the Viceroy of Egypt. The Band of the First Life Guards will perform, by permission of Colonel Hall, at 4 o'clock, on Saturday, May 17, and on every succeeding Saturday, until further notice. Admission, 1s.; on Mondays, 6d.

GLASS FOR CONSERVATORIES, &c.

Milk Pans, 2s. to 6s. each; Metal Hand frames, Glass Tiles and Slates; Cucumber, Propagating, and Bee Glasses; Wasp Traps, Glass Shades, and Plate Glass, at 87, Bishopsgate-street Without, same side as Eastern Counties Railway.—Established 100 years.

HORTICULTURAL SOCIETY OF LONDON.—NOTICE is hereby given that the Second EXHIBITION of FLOWERS and FRUIT, in the SOCIETY'S GARDEN, will take place on SATURDAY, June 7th.

Tickets can be procured at this Office upon presenting the order of a Fellow, price 5s. each; or, on the day of the meeting, at Turnham-green, price 7s. 6d each.

PRIVILEGE OF FELLOWS.—Each Fellow of the Society has free personal admission to these Exhibitions without a ticket. He may also personally introduce a friend with an Admission Ticket at half-past Twelve, at Gate No. 4 in the Duke of Devonshire's road; or, if unable to attend personally, his wife or sister may represent him, provided she is herself furnished with an admission ticket to which his signature is attached. Similar privileges belong to Ladies who are Fellows of the Society.

Messieurs les étrangers qui desireront se procurer des billets d'admission pourront en obtenir des mandats en s'addressant à leur Ambassade ou à leur Consulat.

21, Regent-street, London.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.—UNDER THE PATRONAGE OF HER MOST GRACIOUS MAJESTY THE QUEEN. The SECOND EXHIBITION for the Season will be held at the Royal Surrey Zoological Gardens, on WEDNESDAY, the 28th of May—open to all Exhibitors—when Prizes will be awarded for the following productions viz.: Miscellaneous, Orchidaceous, and Specimen Plants; Pelargoniums, Cape Heaths, Azaleas, Tulips, Heartsease, Vegetables, &c. In addition to the prizes offered by the Society, Mr. R. J. Lawrence, of Hampton, offers 5l. value of Tulips to Amateurs; also, by subscription, Prizes for Seedling Tulips and Heartsease, in addition to Certificates granted by the Society.

The following Exhibitions will also take place at the Royal Surrey Zoological Gardens: on Wednesday, June 25; Thursday, July 24; and Wednesday, Sept. 3.

List of Prizes and the Rules for Exhibition may be obtained from JOHN TAYLOR NEVILLE, Secretary.

Ebenezer House, Peckham, Surrey.

NEW DAHLIAS; E. FOSTER'S, Esq., CHOICE PELARGONIUMS; PICOTEES, CARNATIONS, HOLLYHOCKS, PANSIES, &c.

WILLIAM BRAGG, Star Nursery, Slough, begs to say his Catalogue of the above Flowers is now ready, and can be had on application. His choice SEEDLING DAHLIAS will be sent out the first week in May at 10s. 6d. each, viz:—

ADMIRAL, rich lilac, very constant, gained first Seedling prize, 25s., at the Royal South London Exhibition; 21s. Shacklewell Open Showe, &c, fourteen first class certificates; the most successful flower of the year.

CARMINA, rich carmine, constant show flower, gained six first class certificates, &c., shown in several winning stands.

The Hon. Mrs. ASHLEY, waxy white, tipped with rose, splendid show flower, &c. W. B. thinks it the best Dahlia of the season; was awarded by Dr. LINDLEY a certificate of merit at the Horticultural Society, &c. Gained five first class certificates.

QUEEN OF FAIRIES, Domeyer. W. BRAGG has purchased the stock of this fine and constant fancy Dahlia, from the above amateur, who will give 5l. in prizes the next season for this flower. It gained a Seedling prize and first class certificate, with Edwards's Mrs. HANSARD; at the Royal South London Open Show Exhibition five first class certificates.

W. B.'s stock of Picotees, Carnations, and Pinks are strong and good; the best Hollyhock Seed ever sent out can be had in 2s. 6d. and 5s. packets, post paid, for prepayment.

EXHIBITION OF TULIPS.

HENRY GROOM, Clapham-rise, near London, Florist by appointment to HER MAJESTY THE QUEEN AND TO HIS MAJESTY THE KING OF SAXONY, respectfully informs the Nobility, Gentry, and the Public, that his SUPERB COLLECTION OF TULIPS is now in flower, and can be viewed every day, from 9 o'clock until 6, Sundays excepted. Admittance 1s., Children half price.

CHOICE BEDDING PLANTS.

HENRY WALTON, FLORIST, &c., Edge-end, Marsden, near Burnley, Lancashire, begs to offer the following at the extremely low prices attached, viz., 100 fine named Dahlias, including several of 1850, for 50s.; 50 for 30s; 25 for 9s. to 18s.; 12 for 4s 6d. to 9s.; Pansies, 25 fine named varieties, 10s.; 12 do., 4s. 6d. to 6s.; 12 fine named Pinks, 4s; 12 Verbenas, 3s. 6d.; 12 fine named scarlet Geraniums, 4s. 6d. to 6s.; 12 Ivy-leaved do., 4s.; 12 common Geraniums, fine strong plants, 4s. 6d. to 6s.; 12 Cupheas, 3s. 6d.; 12 Heliotropiums, of sorts, 4s.; 12 fine named Petunias, 4s.; 12 Mimulus, 4s.; 12 Lobelia erinus, of sorts, 6s.; or 12 of each of the above lots for 2l. The above may be had the second week in May, in strong healthy plants, securely packed, so as to ensure safe delivery of all orders.

Achimenes Tugwelliana, longiflora alba, fimbriata, Ghiesbreghtii, Bodmeri, Escherii, rosea superb, eximia rosea, cordata, Knightii, Skinneri grandiflora, patens major. The above 12, free by post, for 10s.; or 6 for 7s. 6d. Gloxinias, 12 fine named varieties for 9s. to 16s; or 6 for 5s. to 10s.

Catalogues may be had by inclosing one stamp. Strong well-rooted plants may be depended upon. It is respectfully requested all orders be accompanied with a Post-office order, made payable at Marsden, near Burnley, Lancashire.

"KOH-I-NOOR."

NEW AND ELEGANT FUCHSIA.—Fine plants are now ready to be sent out of this superb and unrivalled Fuchsia KOH-I-NOOR, which has proved itself one of the finest of the dark varieties. The flowers of extra large size, brilliant and very glossy colours; tube and sepals rich crimson; the corolla a fine purple; sepals well reflexed, showing the rich corolla to great advantage, and an abundant bloomer; the plant is also of very superior habit, and first-rate for exhibition; no collection can be complete without this forming the centre. It will also be found a most useful plant for the Nurseryman, as it continues in bloom for six months, the flowers always retaining their fine colour, and hangs well on the plant. It was seen by the following first-rate judges when in bloom last season: G. D. Fisher, Esq.; Mr. J. Pond, of Devonshire Cottage; Mr. Cole, Gardener to Miss Bayley; Mr. Carmichael, Gardener to G. Tugwell, Esq.; Mr. Hogg, Gardener to General Audrews; Mr. Grant, Gardener to G. Sims, Esq.; Mr. Wooton, Gardener to the Rev. E. D. Rhodes; Mr. Drummond, Nurseryman; Mr. Scott, Bathford; Mr. Freeman, assistant to Mr. Griffin, Nurseryman, all of Bath; and Mr. Ivery, of Peckham, London, all of whom passed their opinion in the following manner: "Your Fuchsia is one of the finest dark varieties we have yet seen; the habit is certainly splendid, and there will be no doubt as to its giving satisfaction to all who grow it."

Fine strong plants, 1 foot high, such as will make good specimens this season, will be sent, on receipt of the amount of 10s. 6d., namper and package included; smaller ditto, such as can be sent by post, 7s. 6d. each, box and postage included, when remittance accompanies the order. The usual allowance to the trade when three plants are taken.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath.

*** Forget-Me-Not, Myosotis azurea grandiflora, can still be supplied at 2s. 6d. per packet.

ROSES, IN POTS, FOR PLANTING OUT.—A Descriptive Catalogue of AUTUMNAL ROSES has been recently published, in which are inserted some new Hybrid Perpetual Roses plants of which can be had in pots, grafted on Manettii Rose stocks. The above is sent free per post, on application to THOMAS RIVERS, The Nurseries, Sawbridgeworth, Herts.

SELECT BEDDING PLANTS.

BASS AND BROWN have a large and fine Stock of the following, well established, and now sending out; they are mostly in small pots, so as to be packed in a little compass. Those marked * can be sent free by post, if required.

SCARLET GERANIUMS, in variety, strong, 6s. and 9s. per dozen.

* VERBENAS, a large collection of the best sorts for forming dwarf beds, such as Apollon, Anacreon, Defiance, Emma, Eclipse, Eyebright, Junon, Princess Alice, Psyche, Rosati, Vulcan, White Perfection, and others, 4s. per dozen.

* PETUNIAS, a large collection of bright purple and crimson flowers, 5s. per dozen.

* FUCHSIAS, a large collection of select varieties, 5s. p. doz.

DAHLIAS, the best varieties, both show and fancy, 5s., 9s., and 12s. per dozen.

Heliotropes of sorts, 4s. to 6s.; Bouvardias of sorts, 9s.; Lantana crocea, 6s.; Lobelia maxima, erinus, &c., 4s.; Blue Anagallis, 6s.; Cupheas of sorts, 6s.; Calceolaria of sorts, 6s. and 9s.; Dielytra spectabile, 12s.; Cheiranthus alpinus, 12s. per doz., and many others.

Also the following selections of newer varieties:

GERANIUMS, 12 fine show vars., 12s.; 12 superb do., 21s.

FANCY GERANIUMS, 12 beautiful vars., 12s.; 6 for 7s. 6d.

* FUCHSIAS, 12 fine vars., 9s.; 12 superb new vars., 15s.

DAHLIAS, 12 fine vars., 9s.; 12 quite new vars., 21s.

" FANCY, 12 fine vars., 9s; 6 quite new, 10s.

* PETUNIAS, 12 fine vars., 9s.; 12 superb new vars., 12s.

* VERBENAS, 12 fine vars., 7s. 6d.; 25 do., 12s.; 12 superb new, 12s

HARDY BORDER PLANTS, 100 select vars., 30s.; 50 for 30s. superior and new, 50 vars., 30s.; 25 for 17s. 6d.

" ROCK PLANTS, 25 select vars., 12s; 12 vars., 7s. 6d.

ANTIRRHINUMS, 12 fine vars., 6s.; 12 superb new, 10s.

PHLOX, 12 fine vars., 6s.; 25 vars., 10s. 6d.; 12 superb newer, 9s.

PENTSTEMONS, 12 fine vars., 7s. 6d.; 6 vars., 5s.

GREENHOUSE PLANTS, 12 select vars., 15s.; 25 fine vars., 28s.

STOVE PLANTS, 12 new and select vars., 18s. to 24s.

* ACHIMENES, 6 splendid new, 7s. 6d.; 12 fine vars., 9s.

GLOXINIAS, 6 splendid new, 7s. 6d.; 12 fine vars., 12s.

NEW PLANTS, see a List in the *Gardeners' Chronicle* for May 3d, April 26th, and April 19th.

Stamped Catalogues forwarded on application, free.

Remittances requested from unknown correspondents. Post-office orders to be made payable to BASS and BROWN, or STEPHEN BROWN. Postage stamps received for small amounts.

BASS and BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

The Gardeners' Chronicle.

*SATURDAY, MAY* 24, 1851.

MEETINGS FOR THE ENSUING WEEK.

COUNTRY SHOWS.—Tuesday, May 27: Derby Tulip.—Thursday, May 29: Oxford Horticultural.

THOUGH much practical benefit has accrued both to the gardener and farmer from the modern improvements in organic chemistry, it can scarcely have escaped the observation of any intelligent reader that a sort of absolutism is frequently displayed in the enunciation or recommendation of any favourite scheme. This is scarcely consistent with the minute circumstances, that may produce very different results from those which were at first anticipated. Where vital organs are the subject of inquiry, or where they are involved in the production of chemical changes, we must be prepared frequently for very unexpected results; we must act with great caution, both as to the hopes we may form and the inferences we may be inclined to draw. Without some mental discipline of this description we shall be liable to much disappointment, and may incur considerable loss in the working out of our theories. The truth of this has never been more forcibly brought before us, though it has always had a very palpable influence on our speculations, than by the perusal of the abstract of the very important memoir, by M. CLAUDE BERNARD, which appeared in the "Comptes Rendus" for October 21, 1850, on the production of sugar in the liver of various animals. Its bearing on many questions in vegetable physiology is so evident, that we make no apology for calling to it the attention of our readers, though in itself purely zoological.

The mixture of sugar in blood and other animal fluids, has been long considered as a merely accidental circumstance, but it appears that not only is it a constant and indispensable fact in the regular accomplishment of the functions of nutrition, but that its presence does not depend upon any particular nutriment, and is effected in the liver of man and other animals by a special action of the organ in which it is produced.

During the process of digestion, the blood which proceeds from the liver by the subhepatic veins invariably contains sugar, whatever may be the nature of the food that has been taken. At this period the substance of the liver is impregnated with sugar to a considerable degree, which is not the case with any other organ, insomuch that the presence of sugar, during the process of digestion, is a certain distinctive test of that particular tissue from all other tissues.

In proportion as the digestive process declines or entirely subsides, the quantity of sugar poured by the subhepatic veins into the general circulation diminishes, as also that contained in the hepatic tissue itself.

The author has shown very clearly by experiments conducted on various animals, that the sugar is not derived directly from the nutriment taken. Even when substances were administered which could not, according to received notions, under the process of digestion, give rise to any saccharine principle, saccharine matter was still present in the liver. In dogs fed for several months with nothing but meat, though no sugar existed in the intestines, or in the blood carried to the liver by the *vena porta*, that of the subhepatic veins was always saccharine. After long continued abstinence, when saccharine matter has entirely vanished from the tissue of the liver, as soon as digestion commences, though nothing except meat be administered, the sugar reappears in the liver, and must therefore arise from some specific action in that organ.

The sugar then produced has all the characters of glucose, and when fermented with yeast produces alcohol and carbonic acid. Its solution is rendered brown by caustic alkali and decomposed by tartrate of copper dissolved in potash.

It may be added that it is decomposed by contact with blood and animal tissues more rapidly than ordinary glucose, so that, in consequence, investigations must be made as soon as possible after the death of the subject.

Another very singular point is the influence of the nervous system on its production. The division of the two pneumogastric nerves makes it disappear at once; and, on the contrary, if the spine be punctured with a very sharp instrument, between the point of origin of the nerves just mentioned and that of the emergence of the auditory nerves, saccharine matter is produced abundantly; the blood and other fluids are surcharged with it, and the animals become, in fact, diabetic.

SOME papers have lately appeared in the Journal of the Agricultural Society, respecting the varieties of CLIMATE to be found in the British Islands. They are interesting as far as they go, and may possibly have greater truth and importance in an agricultural point of view than in an horticultural one, in which, at least, they require to be corrected in more than one instance.

It is well laid down that the ruling cardinal points of our climate are rather east and west, than north and south; in other words, that the compass, considered as an index to the climate of Britain, must be imagined as turned one quarter round,—that is, that our coldest point is east, not north; our warmest, west rather than south.

This fact is both true and important, as far as climate depends on prevalent winds, which it does more exclusively in these than perhaps in any countries in any latitude. But the sun's place in the heavens being constant, according to the season in each respective latitude, this item also must be admitted as a modification of those circumstances of climate previously alluded to, which depend upon the winds. The sun's power in each latitude, *per se*, is a fixed quantity: the influence of the winds a variable one in two senses. First, the alternation between east and west winds, which forms the basis of our peculiar climate; secondly, the variation in these alternations from one season to another, which requires an average to be struck, or assumed, before it can be used as an ascertained quantity in any theory on the subject. In short, the sun's power will be the given fixed principle of the climate, the wind's influence the modifying one.

We conceive therefore, that the nearly meridional lines by which the new climate-map of England is divided, will have to be crossed by other lines more or less approaching the latitude, before a correct estimate, at least for horticultural purposes, can be arrived at.

Every climate out of the tropics can only be correctly estimated after a long experience of three principal circumstances, viz.: the maximum, minimum, and average of winter temperature, of summer temperature, and of annual temperature. These will not depend on the two great causes alone beforementioned, sun and winds: other circumstances, meteoric and geographical, will conspire to make great differences in the results obtained from localities not far distant from each other. The proximity of the sea, which affects not only the temperature, but in a degree too much overlooked, the quality of the air in its vicinity: the elevation above it, connected not only with the coldness but rarity of the atmosphere: the light: the great difference between sea-fog, mountain-fog, and river or ground-fog (a dis-

tinction not unimportant in a sanitary point of view): the general slope or fall of the ground towards a cold or a warm quarter: the exposure to any wind more than another: and, lastly, the quality—not the richness—of soil as taken in conjunction with all the above particulars—must be considered, before pronouncing on a climate in relation to practical purposes of horticulture.

The most striking feature in the climate of Britain, the increase of dampness and mildness—or absence of extremes, of either heat or cold, at any season—is well laid down in the papers of the Agricultural Journal before alluded to. Adopting this as a principle more or less applicable to the whole length and breadth of Great Britain (Ireland will be separately accounted for), it will be interesting to trace the points successively along the coast, at which the gradual change of climate becomes perceptible.

Beginning from the mouth of the Thames, and following the shores of Kent, we find a large mass of country, in some parts of considerable elevation, exposed to the full blast of the east wind, which the storms of the German Ocean, combining frost with violence, pour in a continued stream from the icy Baltic to the two Forelands.

Proceeding westwards, the more sheltered tract of the Weald of Kent and Sussex opens as soon as we have passed the bold chalk heights of Folkstone, and immediately a slight improvement is observable in the temperature of the districts near the sea; among which the neighbourhood of Hastings is the first that can be said to possess any decided advantage. This advantage, however, is soon lost, and the bleak downs of Sussex, from Beachey Head to Brighton, and nearly to Bognor, separate by a long distance the warm nooks of Hastings and St. Leonard's from the next district whose climate shows a marked improvement. That district is comprised in the low tract around Chichester, between the downs and the sea.

Next comes the larger tract well known as a great horticultural district; the environs of Southampton, and the Southampton Water, including the Isle of Wight. This tract is worthy of remark for two reasons.

First, the influence of the sea air and consequent mildness of the atmosphere, extends further inland than in any of the before-named instances. Secondly, the breadth, north and south, of the district influenced by this milder temperature is already become, as we advance westward, so considerable, that a still further increase of mildness, or what may be termed a sub-division of climate, begins to be observable in the southern parts of it.

This sub-division begins with the Isle of Wight, or more strictly speaking with Undercliff and southern coast of that island; and may be taken for the commencement of the climate of Devon and the western counties. Further westward, the isle or rather peninsula of Purbeck, together with the southern part of the New Forest, are a continuation of the Southampton range of climate, the sheltered nooks along this coast partaking to the full of the advantages of the southern coast of the Isle of Wight.

The whole Weymouth district south of the chalk downs, and now all the coast further westward, the great valley behind Bridport and Lyme, appear to be on a par with the mildest parts of the Isle of Wight, and in the sheltered combes and southern slopes near the sea, attain a combination of winter and summer temperature perhaps superior to it. On descending from the chalk downs, the climate of Devonshire may be said to begin, at least of Devon east of Dartmoor, which seems to be the great meteoric ruler of the climates of this part of England.

On arriving at that narrowest part of the South-west of England, where the West of Somerset, between Lyme and Bridgewater, constitutes a sort of isthmus, which makes a peninsula of Devon and Cornwall, we find that the mild temperature, which has been gradually increasing in warmth and extending in range at every successive valley along the coast of the English Channel, is now become the climate of the whole of these counties, and their borders, from sea to sea, the heights only excepted. It even extends beyond the Bristol Channel, and may be said to comprehend the whole coast of South Wales between the mountains and the sea.

Dartmoor, with other high lands occupying the centre of Devonshire, forms the great wall of division between the Eastern and Western sections of that county, sheltering the former from the storms of the Atlantic, and the latter from frosts of winter and spring. As may be expected, a marked difference is to be observed between the vegetation of the two districts; the eastern being more favourable to trees and fruits, the western to tender shrubs and evergreens, as well as to herbaceous plants of warm latitudes. It will be understood that here, as everywhere else, the neighbourhood of the sea gives some additional advantage over even the sheltered districts inland, excepting in the development of the foliage of trees, which is usually earlier, if not finer, in the inland district near the sea, than in the strictly maritime one. This is owing to the effect of wind, not of temperature.

Cornwall, being narrow and near the sea on every side, and, moreover, entirely protected from the east by Dartmoor and its spurs, enjoys, with the Scilly Isles, a more complete exemption from cold than any other county; but its summer temperature is not high in proportion.

The climate of Scilly, Penzance, and the Channel Islands, has been thought something exceptional, and beyond even what has been here described as that of Cornwall in general. It were much to be wished that comparisons were made by means of experimental horticulture (the best of tests where sufficient time is allowed) to settle so interesting a question.

Ireland is generally known to be milder than England, but its southern counties being considerably to the north of the English ones here treated of, it is probable that the south of Ireland only partakes of the climate of the south-west of England and Wales without any decided improvement on it. At any rate the favoured part of Ireland is probably comprehended within the south-east point of Wexford and the mouth of the Shannon. Without positive data it is useless to hazard a more than general opinion. The north of Ireland and south of Scotland would most likely form one region in respect of climate. *S.*

## ORCHIDS FOR THE MILLION.—No. II.

INTRODUCTORY REMARKS.—Now that the nature and the habits of Orchidaceous plants are better known than they were some few years ago, we have become acquainted with the conditions of their growth in the countries where they are indigenous. Here they are exposed to a dry season, during which they are at rest; and to a rainy season, when the heat is higher, and the air moist nearly to saturation. And to grow Orchids in any perfection, their native climate must, to a certain extent, be imitated, viz., they must have a period of rest in a dry and comparatively cool atmosphere, and during their growth and flowering they should be exposed to a high moist atmosphere; but as they principally grow on the trunks and branches of trees, it is important that they should be exposed to a free current of air, and also to the light; this is essential, except in some few species, to prevent the plants being exposed to the direct action of the sun's rays, which is apt to scorch the leaves. The great heat and moisture is only necessary during the time the plants are in vigorous growth, and this period should be during spring and summer, the best periods of rest being from about November till February; and it is the long period of rest which predisposes the plant to blossom. Of course the rules as to the periods of growth and rest can only be stated in general terms. There are certain kinds which do not stop growing, to some extent, all the year round. And again, even of those which do go to rest periodically, in the completion of their growth, it does not always happen that the time of rest corresponds with that time at which the largest numbers go to rest.

PERIOD OF GROWTH.—When the growing season commences, raise the temperature of the East India house to 65° by night and 70° by day; by sun heat it may be allowed to range to 75°, and as the days lengthen, so the temperature may be permitted to increase, and during the months of May, June, July, and August it should range from 70° to 75° by night, and from 75° to 80° by day, and by sun heat to 85°, or even 90°; this will not do any harm, provided the plants are shaded from the direct rays of the sun. The Mexican house should be 60° by night, and from 65° to 70° by day; and as the days lengthen, so the temperature may be allowed to increase; and during the months of May, June, July, and August the night heat may range from 65° to 70°, and by day from 70° to 85°. Great attention should, at the same time, be paid to the state of the atmosphere, as regards moisture; at all times of the year this is of much importance to the successful growth of the plants, for they derive the greater part of their subsistence from the moisture in the air, so that wherever any plants are growing, the atmosphere should be well supplied with moisture: this is obtained by pouring water over the tables, walls, and paths of the house every morning and afternoon, and by keeping the hot-water tanks full, which will cause a nice gentle steam to rise, which is of especial value whilst the plants are in a vigorous state of growth, especially as regards the East Indian Orchids, such as Aerides, Saccolabiums, Vandas, Phalænopsis, Dendrobiums, and many others requiring a high temperature, with a considerable degree of moisture. The Mexican Orchids, most of which come from a cooler climate, not so saturated with water, of course require less heat and moisture, but these should have a considerable degree of warmth during their growing season.

WATER.—This should be administered with great care, especially in the case of plants just starting into growth, as, if watered too profusely, the young shoots are apt to be affected by the moisture of the house and by what is termed damping off; whilst, therefore, the shoots are young, only enough of water should be given as is sufficient to keep the peat in which the plants are grown moist. As they advance in growth, more may be given; and, when the pseudo bulbs are about half grown, they may have a good supply at the roots. My practice is to shut up the house in the spring of the year about 3 o'clock, and in May, June, July, August, and September, I shut it up about an hour later, when the heat of the sun is on the decline. I then usually give a gentle syringing with water as nearly as may be of the same temperature as that of the house. In fine weather, the temperature from sun heat will increase frequently as high as 95°, or even more, but I never have experienced any injury from this, so long as the house was saturated with moisture, in which case there is no fear of any injury to the plants. The house should be dried up once a day, if possible, by means of ventilation. In syringing be very careful not to wet the young shoots too much. The syringe should be furnished with a fine rose, so as to cause the water to fall on the plants in imitation of a gentle fine shower of rain, but this syringing should only be done after a hot summer's day. Those plants which are growing on blocks of wood should be syringed twice a day in the summer time; and I also find it a good method, during the growing season, to take the blocks down and dip them in water till the wood and moss are thoroughly soaked. Plants in baskets should likewise be taken down and examined, and, if they are dry, they should be soaked in the water. This is also a good mode of getting rid of many insects that harbour in the Moss, such as the woodlouse and cockroach; when the moss is soaked, they will come to the top, and then they may be easily killed. Rain or pond water is the best.

## FOREIGN GARDEN GLEANINGS.

ST. PETERSBURG.

FORCING.—As, in consequence of the extreme cold, the inhabitants of St. Petersburgh can preserve their vegetables from one year to another, there is no great demand for forced vegetables; the few that are sought after are Asparagus, Salad, early Carrots, Mushrooms, which are, however, found wild in abundance in the neighbouring woods, and especially Water Melons. Peas are grown in pots, into which the seed is put at the end of autumn, and which are then put under cover for the winter. This plan was introduced into Russia some 20 years ago by a French gardener who was enabled to gather Peas in February, and to sell them for 4*l.* per lb. As this sum is, however, too large for most people, the Russians keep the Peas through the winter. We have ourselves tasted Peas thus kept, and to our taste they were as good as any we ever met with.

No idea can be formed of the quantity of pits and houses employed for raising early eatables. Pear, Apricot, Cherry, and Plum trees are all treated in the same way; but the houses in which they are kept have roofs sloping in opposite directions, one side being taken off on the approach of fine weather; the trees themselves, always small, are placed in rows which alternate.

Apple trees and Gooseberry and Raspberry bushes are generally in the open air; however, they are often, together with Fig and Peach trees, sheltered under houses with a single slope. These plants are, in such a case, put at the bottom of the house, against the wooden wall which supports the sashes; before them, other plants are arranged according to their heights. If the house is low, the Peach trees are allowed to keep their upper branches only, which are then made to follow the glass sashes, so as to get as much heat and light as possible; the spaces between the stems of the Peach trees are filled up with Vines, and, under the sort of cradle formed by the falling branches, Strawberries and little trees in pots are forced.

No gardeners in the world, perhaps, understand how to imitate natural temperature so well as the Russians; it is to their excellent management in this respect that their success in forcing is almost entirely owing. Another great advantage, due to the climate, is the facility with which Russian gardeners can check vegetation by means of cold. Ice-houses are generally used for this purpose; but, in our opinion, better results might be obtained by other means. Why, for example, should they not do in St. Petersburgh that which is done in the agricultural and horticultural school in Finland, to keep milk and meat for summer's consumption; that is, why should they not have next to a cold-house a place set apart for ice-houses, and separated from the first by a wall pierced with valves? By opening or shutting these valves, the air in the plant-house might be cooled at pleasure; in this way, not only fruit trees, but ornamental plants, might be checked in their growth whenever necessary.

VEGETABLE AND FRUIT MARKETS.—St. Petersburgh possesses several fruit and vegetable markets, which are supplied from the interior of Russia and from France, by way of Havre. The principal and best provisioned daily market is that of the Sennaia, where fruit, notwithstanding its abundance, is 20 per cent. dearer than in Paris. This is the more surprising, as the products are not nearly so fresh as our own. In the spring there is little except what is forced, and that is by no means first-rate. Lettuce badly grown, long Asparagus, small Radishes and Carrots may be met with; the last three in great abundance. Cabbages, Potatoes, and edible fungi may be had until July. Peas are abundant during the fine season, as are also herbs used for seasoning, of which the Russians are very fond. Artichokes, which

can only be grown with difficulty, and at a considerable expense in this latitude, are extremely dear.

Fruit for the table is dear. After the 20th of May fresh Grapes, Peaches, Plums, Apricots, Cherries, Strawberries, Pine-apples, Peas, and Haricots, are all very fresh and dear. Here follows a table of the prices of some fruits, for the accuracy of which we are responsible :—

| | kopecks. | s. d. | s. d. |
|---|---|---|---|
| 1 Plum ... ... ... ... ... | 20 equal | 0 8 | |
| 1 Peach, moderate in size and quality | 30—35 ,, | 1 0 to 1 | 1 |
| 1 Pear ... ... ... ... ... | 25—50 ,, | 0 10 to 1 | 8 |
| 1 Apple ... ... ... ... ... | 25—50 ,, | 0 10 to 1 | 8 |
| 1 Cherry ... ... ... ... ... | 15—20 ,, | 0 6 to 0 | 8 |

Other fruits, such as Grapes, Melons, &c., have no fixed price ; Pine-apples, alone, are one-third less dear than in Paris. The Melons have but little taste ; a fine skin, and a flesh whitish or greenish, and very juicy, distinguish them at once from our own. Oranges and fruits for preserving are abundant, but can only be enjoyed by the rich ; less wealthy people content themselves with Onions, Cabbages, Cucumbers, and different sorts of salad.

We said that the vegetables which are sold in St. Petersburgh come, for the most part, from France and the interior of the Russian empire ; a large quantity is also supplied from the environs of the capital. The market gardens extend over a large tract of country, and are, for the most part, cultivated by the peasants of Rostoff and Hechael, whose ancestors were sent by Peter the Great into Holland for the express purpose of learning the best method of cultivating such gardens. The argilo-silicious nature of the soil, its situation, and its impermeable subsoil, render it very cold. The gardens are almost always surrounded by wooden pales, and common plants are cultivated in summer and forced ones in winter. The latter are not numerous enough to demand any comment. We shall, therefore, confine our remarks to the former.

We have already mentioned that the fine season at St. Petersburgh is very short ; the market gardeners are compelled to set to work and prepare their soil the moment the frost is fairly gone, and to make the most of the favourable weather which is destined to last so short a time. At the beginning of May, or even towards the end of April, they level the soil so as to expose it to the action of the atmosphere ; soon afterwards they throw it into trenches 1½ foot wide, and separated by planks 4 feet wide, which occupy the places of the trenches of the preceding year. In this way the soil is always worked after being rested, perfectly heated by the sun's rays, and drained of the quantities of water it at first held. When this operation is completed, the planting and sowing commences, generally in the middle of May ; and in four or five days from that time, if there be ever so little heat and moisture, the whole ground is sown and planted. Cabbages, Onions, and sometimes even Potatoes, are placed next the planks ; Carrots, Spinach, Rape, Radishes, Turnips, Cucumbers, Lettuces, and Beet, occupy the middle. The Cabbages, Cauliflowers, Lettuces, Onions, Cucumbers, and Beet, are at first placed under sashes ; the others do not require this protection.

Asparagus, Artichokes, and Cauliflowers, are objects of a special cultivation and luxury ; so are Water Melons, which are better in Russia than in France.

Strawberries also form a special branch of cultivation. M. Saracelotsol, gardener at Ropcha, near St. Petersburg, grows no Strawberry except the Roseberry, and for this he has a very large demand. *Masson's Report.*

## BRITISH SONG BIRDS.

(Cage Birds, No. 15.)

No. XXXI.—We last week introduced an extraordinary episode in the history of the Canary,—an episode which will be carefully treasured up by all admirers of that elegant and truly fascinating bird of song.* I now keep faith with my readers, by returning at once to a further consideration of the claims pressed upon us at this season by the nightingale. His charming voice is, I rejoice to say, still heard in the favoured spots where he loves to dwell.

Now that the nightingale is keeping us awake the live-long night, with the music of his celestial voice,—while every grove and every thicket echoes to his song,—small *pleasure* is it to me to sit down, and plan in cool blood how we may hold him a prisoner for life,—how confine him by bars of wire, and walls of wood ! Yet, as duty and pleasure are not inseparable, and I have *undertaken the task*,—let me to it with all the nerve I can muster. So now to descend at once, to plain prose.

Many persons refuse to keep nightingales, because of the trouble incurred in procuring them fresh meat, twice daily. It may be some relief to such individuals to point out a substitute for raw beef.

I have been acquainted, in my time, with several first-rate nightingale fanciers ; and by interchanging "notes" with each other, we have picked up many facts worth recording. Among others, it appears, that the nightingale will live and thrive both upon German paste and bullocks' liver.

The former, however, will suit "branchers" and nestlings only. By "branchers" I mean young birds bred here, and caught soon after they have left their parents. By accustoming them, by degrees, to German paste, and stale bun, they will soon get used to it ; and if a mealworm be given them every morning, the diet will agree well with their constitution. Nestlings and branchers, however, are alone to be *so* fed ; and the former must on no account be put on such diet *too suddenly*. Until a nestling is at least six weeks old, he must have succulent food given him. *Then* you may mix a small quantity of German paste with the raw meat, until he acquires a taste for it. We will say nothing about a *relish* for it ; for I am quite sure raw beef is, after all that can be said, their most natural aliment. Nestling nightingales ought be taken, if taken at all, when about 8 days old, and fed with the end of a *stick*, exactly in accordance with the instructions I have given, under the article,—"Canary." Every now and then, when their rapacious mouths are turned up for food, dip your little finger into cold spring water, and let a drop or two dribble into each bird's throat. It assists their digestion wonderfully.

When it is a *sine quâ non* that a fresh caught bird, just arrived, should be fed upon bullocks' liver, bear in mind that raw beef must in the first instance be given him, or he will inevitably die. The liver must gradually be introduced in his food, so that he may get an acquired taste for it. By degrees, the quantity of beef must be lessened, and the liver increased—the former, eventually, being discontinued altogether.

The proper place to get your bullocks' liver, well boiled, is at the tripe shops. Ask for a pennyworth of the "nut" of bullocks' liver. See that it is quite fresh, and grate it fine on the smaller-sized holes of a bread-grater. A little stale sweet bun may occasionally be rubbed in with it. If your birds thrive on this—and I have known some remarkably fine birds do so—you will be spared a world of trouble and anxiety. Grate your liver every morning, and see that is sweet. The blow-flies will do their utmost poison to it, the moment they can get at it. When this occurs, change it directly.

The food on which nightingales live, being an animal substance, causes, when digested, a very offensive smell in their cages. This renders it a matter of imperative necessity to clean and scald their trays regularly every morning. When dry, cover them thickly with fine red sand. This will prevent the woodwork from being unduly tainted. You will never regret following out this instruction, to the very letter.

Many, novices, imagine that because nightingales are caught with meal-worms, of which they are remarkably fond,—that *therefore* they should be abundantly supplied with them. This is a palpable mistake. It must be borne in mind, that these birds, like many others, when in confinement, can get little exercise. Consequently, their digestion is comparatively feeble ; and, if fed upon much live food, they would be liable to fits—perhaps to apoplexy. I should recommend, not more than one daily. Still, meal-worms should always be kept in the house, in case of sickness. When one of these "birds of passage" is ill, nothing is so good as a meal-worm to restore him. It acts beneficially on his system. I am induced to be very precise and very minute in my instructions with respect to these birds. When I first commenced treating of them, I thought, and hoped by the way I expressed myself, that I should deter many persons from attempting to keep them. It seems, however, that the effect has been the extreme opposite from what I intended ; and I am, daily, urgently entreated to give the fullest possible instructions for their being kept in a state of health and song. It fortunately happens that I am well and deeply read in all that concerns the nightingale. As, therefore, it would be unkind in me to withhold the knowledge of what will benefit my little "pet,"—seeing that he is "doomed" to be immured in a cage—I will continue to speak clearly and kindly of all that will tend to his well-being in confinement. Let me hope, in return, that my advice will be strictly followed. *William Kidd, New-road, Hammersmith.*

* I am asked by several parties if I can introduce them to a sight of what I spoke of, last week ? I must politely but firmly decline interfering in this matter ; as it would be ungrateful in me to attempt to invade the privacy of any family, from whom I have received such marked attention. If there were *many* applications of this kind made, a gentleman's "house" would cease to be "his castle."

## ON THE POISONOUS QUALITIES OF THE TOAD AND SALAMANDER.

By MM. Pierre Gratiolet and S. Cloez.

It was formerly the universal belief that the land salamander (Lacerta salamandra L.), possessed a subtle poison ; this belief has been of late years abandoned, although a great acridity is still attributed to the viscous and milky liquid secreted by the pustules of the skin of this hideous animal.

We were led a few years ago to doubt the harmlessness of the salamander, by observing that some frogs placed in a tub with some salamanders died at the end of a week, and without any assignable cause. Having subsequently some healthy salamanders, we determined to ascertain, by experiment, whether our doubt was or was not founded upon truth.

The liquid obtained from the cutaneous pustules of the salamander is perfectly white. It has a strong acrid smell. When quite fresh it flows like milk, but after a short time it coagulates ; this coagulation takes place instantly if alcohol be added to the liquid ; it has a strong acid reaction. A small quantity of this humour placed under the skin of the wing or thigh of a little bird at first produced no visible effect whatever ; but in two or three minutes the bird grew uneasy, ruffled its feathers, tottered, soon showed signs of great suffering, opened and shut its mouth convulsively ; at the same time it stretched itself more and more, threw its head back, uttered cries of distress, became agitated, turned over several times, and then died.

A greenfinch (Bruant), wounded in the wing, died after a struggle of two or three minutes. A lark (Pinson), also wounded in the wing, died in 25 minutes, after two epileptic attacks. Several other birds, on which the experiment was also tried, died in six or seven minutes ; death was quickest in those cases in which the blood flowed from the puncture slowest. A greenfinch—wounded in the thigh, lost a considerable quantity of blood ; it did not die for 25 hours ; for the last 12 hours it was in a torpid state, broken at intervals by slight convulsions. We should add that two hours after the poison was introduced, we made the bird breathe a little ammonia, which seemed to lessen its pain and prolong its existence.

We also made some experiments with larger birds. A pigeon wounded slightly in the wing died in 20 minutes, after terrible convulsions and alternate paralytic attacks, which began after the 8th minute. All the birds acted upon by the milky secretion of the salamander were seized with epileptic convulsions.

We also tried the effect of the secretion on small mammals, such as mice or guinea pigs, by inoculating them in the thigh. They all experienced great torture at the end of 10 minutes. They breathed with difficulty and by fits ; they continually fell asleep, and as continually awoke in slight convulsions, similar to those produced by electric shocks. But after some hours these symptoms ceased and the animals recovered.

It seems, then, that a quantity of the milky substance which is sufficient to kill a pigeon has only a temporary effect on a mouse. Now, inasmuch as a pigeon is much larger than a mouse, this difference in the effect produced can only be referred to some difference in their nature and organisation. The mammals experimented upon suffered convulsions, but were not killed.

We also tried some experiments with the milky secretion contained in the dorsal and parotid pustules of the common toad (Rana bufo). This liquid is thick and viscous, its colour is yellow, its odour strong and acrid, its taste intolerably bitter. One of us having by accident tasted more than he intended, experienced no pain ; we, therefore, think that its acridity must be owing to some other liquids mixed with it, and which we propose to examine. Like the secretion of the salamander, it has a strong acid reaction.

We tried the effect of the secretion of the common toad on several small birds ; they all died in five or six minutes, but without convulsions. They opened their mouths, tottered as if drunk, and had evidently lost the power of regulating their movements. At the end of a few seconds they shut their eyes, as if to sleep, and fell dead. Comparing the above experiments, we find that the milky secretion of the salamander and the toad have an equally poisonous effect on birds, but that the first also produces terrible convulsions, which is not the case with the second.

The secretion from the toad killed birds after it had been dried—two milligrammes of the dried poison killed a chaffinch in a quarter of an hour. The poisonous quality of this secretion is not destroyed even though its acidity be neutralised by potash. We have not ascertained what internal derangements are produced by these poisons ; but we constantly found in the birds which were killed distinct symptoms of apoplexy in the region of the brain.

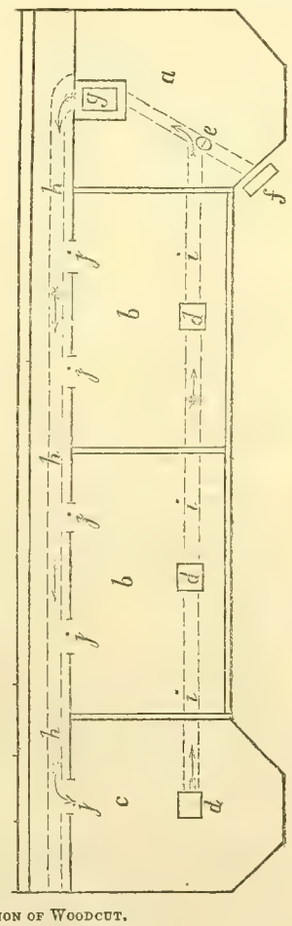
The above experiments, which have been confirmed by M. Chevreuil, show that the popular belief in the poisonous qualities of the salamander and toad has at least some truth, and is not, as has been of late asserted, wholly without foundation. *Comptes Rendus.*

## Home Correspondence.

*Orchid Shows.*—I am not sure that the plan of the Horticultural Society, as well as that of the Regent's-Park gardens, as regards the prizes for Orchids, is in all respects the best ; at present the prizes are all for large plants, that is, as showing good cultivation, and no one who sees the collections that are exhibited, but must be convinced these shows, and the substantial rewards, have led to admirable cultivation ; but the impression is, that only large specimens are fit to compete, and also that the judges award the prizes with especial reference to the largeness of the specimen ; and a cultivator having 20 well grown plants, if they were not large would not think of sending them to be pitted against the gigantic specimens of Mr. Rucker, Mr. Warner, &c. Now this leads to much sameness in what is exhibited, and those who for the last few years have attended the shows, can pretty well divine what will be the plants shown. Mr. So-and-so's large Dendrobium nobile, &c. &c., are sure to be on the table, and most of the specimens are kept back for another show, or at least make their second appearance in the park. And an intelligent amateur, not a grower, observed to me the other day, "After all, one sees year after year nearly the same plants." Now I believe that these shows have entirely led to the admirable cultivation which one sees ; to plants in large masses covered with flowers, instead of the few straggling ones which formerly used to be seen on the best grown plants ; but I think variety might be encouraged by having one or two prizes for smaller plants, which were well grown, and those of the rarer sorts ; there is something of the same kind, as regards size, in other classes of plants, as Roses, Cinerarias, &c. I, who am a beginner, at either of the last shows could have sent 15 or perhaps 20 well grown specimens, but the plants were mostly small, and would have been eclipsed by specimens of the commoner kinds, with 10 or 20 spikes of flowers ; but there would have been eight or 10 kinds which were not shown in the grand collections. I throw this out for consideration. It is possible that what I propose is impossible, or not worth attempting, and moreover it is probable that not having

large specimens, my views are guided by my own interest, not an unusual occurrence. *Dodman.*

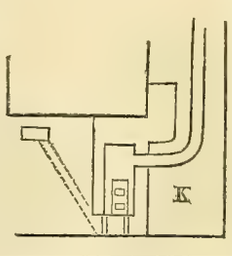
*Tiley's Fuchsia, Koh-i-Noor.*—In the *Chronicle* of last week, there appeared an advertisement from Mr. Edward Tiley, of Bath, in which I am mentioned as one of the parties highly approving of his new Fuchsia, Koh-i-Noor. My name was so made use of without my knowledge or sanction; and, in justice to myself, I hope that you will allow the fact to be stated in your columns. *Matthew Cole, late Gardener to Miss Bayley, of Bath.*



*Tea Roses.*—The Tea Rose, on account of its beautiful tints and peculiar fragrance, is a general favourite; yet with amateur cultivators, who, like myself, reside within a few miles of the metropolis, and are compelled necessarily to grow it under glass in pots, it turns out a complete failure after a season or two. We may be successful with most kinds of plants, but this one proves always more than our match. With great care, I get at first certainly very satisfactory specimens, but I find it impossible to keep the plants in the same state, and the blooms speedily deteriorate. However, before giving up this vexatious and disappointing culture, I have made a new attempt, which has been quite successful, and it is to make this plan known that I trouble you with these lines:—I planted about 50 half-standards and dwarfs in the autumn, consisting of Souvenir d'un Ami, Elise Sauvage, Adam, Devoniensis, &c. &c., in a well-prepared compost, and I erected a low span-roofed house over them, having glass sides to the ground, and side windows for ventilation, and I find it to answer admirably; the plants are looking remarkably healthy and promise well. The shoots are most vigorous and are covered with buds. *W. G., Stoke Newington, May* 20.

*Gardeners' Benevolent Institution.*—I perceive, by an advertisement in your last week's Number, that the annual dinner in aid of the funds of this institution will take place on the 9th of June next, with that distinguished member of our craft, Mr. Paxton, in the chair. I trust that upon this occasion gardeners in the country will assist the labours and endeavours of the committee in securing a large muster to support the chairman; and I would suggest that those gardeners, who have it in their power, should represent the advantages of the institution to their several employers, and solicit permission (and I feel confident it would not, in most instances, be withheld) to contribute a dish of fruit for the dinner. The benefits that would result to the society would, in my opinion, be very great, as possibly it would stimulate those gentlemen who honour the dinner with their presence to contribute more largely, and induce them to patronise the society upon future occasions. I am given to understand that the trouble of getting up a dinner is very great, and I do think the least that gardeners at a distance can do is to assist and further the exertions of the committee by producing specimens of horticultural skill. I hope that this hint will not be lost upon my brother gardeners. *One of the Oldest Subscribers.*

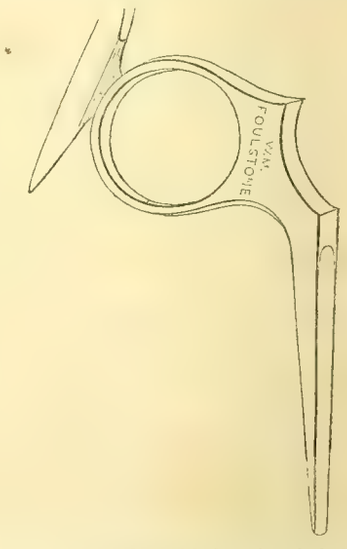
*Asparagus* (see p. 277).—I remark that a correspondent has noticed the system which I follow in forcing Asparagus, and that he has also detailed his own method; but as it is necessary, before we can compare one plan with another, not only to have details of practice but also the results, your correspondent will perhaps be kind enough to give us the quantity of ground he has for forcing, the commencement of cutting of his first and second beds, the number of good heads cut, and the weight per 100; how often he forces his early bed, and other matters likely to assist us in arriving at a correct conclusion, respecting the value of the different methods employed. I have two beds of 30 feet long each for forcing alternately, exactly on your correspondent's plan, but they are only used during the months of March and April, just to keep up the supply between the forced and open air cutting. *J. P., Stoke Rochford.*



*Planting of Forest Trees.*—In the operations of art, we must imitate the processes of nature, and can only cautiously observe, and slowly discover the modes by which the natural world is sustained in the everlasting progression. The seeds of vegetables are matured, and fall to the ground, where they sprout and vegetate, take a hold of the earth, and grow into specimens of the original productions. The huge trees of the vast forests of America grow from the ripened seeds that are dropped and scattered about by the winds and accidents, and the Fir trees of the highlands of Scotland are reared from the self-sown cones of the ripened fruit. The seeds fall to the ground in any promiscuous quantity, they grow in any number as chance directs; accident directs a certain number to outstrip the others in growth, and which grow into trees, cover the whole ground, and smother all the others under their shade. No attention is required, and nature directs the results. From these examples, it may be inferred, that land intended to be planted with trees, be sown with the seeds of the plants in a varied mixture, at the rate of three or four bushels on an acre, where they will grow on the vegetable sward, and where the proper number of trees which the land can sustain for a crop will be reared into a covering for the ground, and smother all others below the shade. For this purpose, the Grass on the land should not be eaten for some years previous to the seeds being sown, as the yearly decomposition of the herbage will produce a stratum of mould, in which the seeds will find a very agreeable bed. In low situations of access, a top dressing of earths or composts will be very beneficial to the seeds when sown, but large extents will prohibit the application. In limited cases it may be used. To ensure a crop, the seeds must be thickly sown, and in a varied mixture, and the ground must be well fenced and protected. No thinning or pruning is ever required—the thriving plants kill all the weak ones, and the under branches decay and die by reason of the want of light and sunshine, in proportion as the top branches strive upwards in order to reach the benefit of the sun. Just as many trees will stand for a crop as the tops can find an upward existence, like an umbrella or an inverted cone. This is true nature, and a legitimate proceeding; it will supersede nurseries and nurserymen, and very much simplify the important department of raising timber. In the Highlands of Scotland, the workman who manufactures the timber can tell if the tree was grown from seed or the nursery plant, by the superiority which attends the former production. Thick planting has been known for some time as a substitute for the mangling knife and hatchet of the pruner, and the sowing of seeds will soon usurp the place of the planter. *J. D.* [We doubt that.]

*Polmaise Heating.*—Although little has been said for some time past in the *Chronicle* regarding the Polmaise system of heating, it is nevertheless still working and getting more into favour by those who know how to use it. I recollect that one of the objections brought forth against the heating of hot-houses by means of heated air was, that the system could not be applied to a range of buildings without separate stoves; but these are critics that have been compared to the boughs of a baneful and a barren tree, that shoots across a fruit tree, at once to screen the sun from it and hinder it by its droppings from producing anything of value. In the gardens of W. Wilson, Esq., of Bannockburn, there has lately been erected a house for stove-plants, two Vineries, and a greenhouse, all heated by means of one stove. From the nature of the ground there were

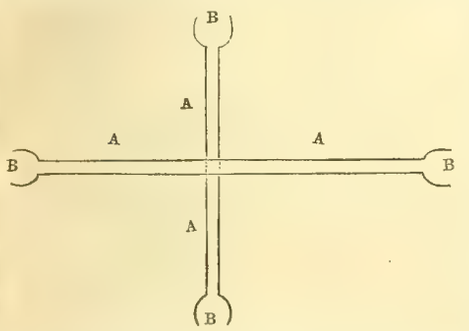
DESCRIPTION OF WOODCUT.



*a*, house for stove plants; *b b*, Vineries; *c*, greenhouse; *d d d*, regulators for return of cold air; *e*, valve for regulating the admission of cold air; *f*, external cold air drain; *g*, heating apparatus; *h h h*, hot air; *i i i*, cold air drain; *j j j*, openings for the admission of hot air into the houses; *k*, section of hot air stove.

what some would call engineering difficulties to surmount, but they have all been overcome, as far as the heating is concerned, by Mr. Sharp, of Stirling, who made the stove and other things connected with the warming and ventilation of the houses. A knowledge of his business and his extensive practice in heating churches, private houses, and garden erections by means of heated air, enables him to work his way through difficulties that others would be afraid to encounter. By referring to the ground plan of the houses, it will be seen that the stove is not placed in the centre of the houses—if it had been so, the heated air would have had a shorter space to travel; neither is it at the back of the houses, where they are commonly placed, but is under the floor of one of them, and from an underground chamber heat is sent out to warm the whole range. Mr. Sharp has also invented a very simple but ingenious apparatus for supplying the air of houses with moisture, which would require to be seen to be properly understood. Mr. MacGriggor, the gardener, is well satisfied with the working of the system, and prefers it to any other mode of heating he has had to manage. The time is gone past when some wore sprigs of Rue by way of prevention, and others rings made of the hoof of a wild ass for amulets, lest they should suffer by the fixing of an evil eye upon them. But the Polmaise heating has nothing to fear, although it is affirmed as a fact, that a man has not firmer resolution from reason to stand by a great principle, than obstinacy from perverted nature to adhere to a bad one. *P. Mackenzie.*

*Rhododendron arboreum.*—Observing that "A. B." wishes to be informed as to whether the Rhododendron arboreum, from Nepaul, flowers in any other part of England except in Cornwall, I feel glad to be able to satisfy him on that point, as this Rhododendron has blossomed regularly and most profusely here for many years, and without receiving any protection in winter whatever. The tree is 9 feet high and 27 feet in circumference. It has not bloomed so well this year as usual, but still it has had 230 trusses on it, each containing from 14 to 21 blossoms. I should say that the colour is decidedly a bright brilliant crimson, and not scarlet. *R. Dixon, Dolaurethy, Carmarthenshire.*



*New instrument for Budding.*—I beg to submit to your notice an instrument which I think is well adapted for cleaning and inserting buds. For several years I have been fond of budding Roses, but I have been frequently disappointed at my buds not growing, although, to all appearance, they have taken well. I attribute the failure to the heart of the bud having been removed in cleaning out the wood. To avoid this I have contrived the instrument, of which the accompanying is a representation, and which I use as follows:—When I have taken off the bud, I take the instrument in my right hand, holding it by putting my forefinger through the ring, and my thumb upon the hollow at the bottom of the long gouge; I hold the bud in my left hand betwixt my thumb and fingers, I then clean out the wood, by passing the instrument betwixt it and the bark, thus

scooping it out sooner than with the point of a knife, and it is not so liable to tear out the bud. I use the small gouge for inserting the bud; after I have made the cut, I raise the bark at the top with the point of my knife, in order to admit the point of the instrument. I then press it down the cut, and in this way the bark is raised much better than by an ivory budder, and it is less liable to get bruised. While the instrument is thus inserted, I have my bud prepared, and slide it down the groove; the instrument may then be taken out, and the bud will be fixed. Whilst tying in the bud, the instrument may be held in the left hand, by putting the little finger through the ring, and allowing the small gouge to be outside, while the large one will lie across the bottom of the fingers, and will not be at all inconvenient. In this way the operation may be performed much quicker than by the ordinary method, and I think with much more certainty of the buds growing. If you consider that the instrument will be useful, I should feel obliged by your noticing it. *Wm. Foulstone, Cutler, 254, Beet-street, Sheffield.* [As will be seen, this contrivance consists of, 1st, a longish gouge for separating the bud and bark attached thereto from the wood. 2d, a smaller gouge for ploughing open the bark of the stock, and so retaining it till the bud is inserted within the hollow of the gouge, the latter being then withdrawn. 3d, a ring connection between the gouges exceedingly convenient, for holding the instrument when not immediately in use. The first is not new in principle. Similar gouges have been successfully used. The form and adaptation of the smaller gouge are, we believe, new; but of the practical utility of this part of the instrument we have doubts. Mr. Knight used no instrument for wedging up the bark of the stock; he preferred lifting it, by a small portion taken hold of between the blade of the knife and thumb. The ring part, as already observed, is a very convenient device. Altogether the instrument is a very nice one for amateurs; and in some cases it may be used advantageously by others.]

*The Calceolaria.*—"G. H." considers "M. P." and "Mr. Rumley's" remarks to apply only to certain localities. In that I beg to differ from him, for wherever one may be placed, plants raised from cuttings will come true to form and colour, and it is much better to be certain what we are growing than to be uncertain. I shall therefore always give cuttings the preference for the general purposes of decoration. The saucer plan, *i.e.*, a saucer partially filled with liquid manure and placed under the plants, is called dangerous; but judiciously applied, much benefit is derived from the practice. The pots must, however, be thoroughly drained, and the liquid manure should never stand on the ball of the plants; the roots should only be permitted to absorb it gradually through the drainage. *J. R.*

*Ventilating Glass houses.* — Being anxious for the advancement of horticulture, I beg to suggest the following plan for ventilating conservatories and other houses, so as to be able to do away with the necessity of opening the lights, and so save all the labour, ropes, and other inconveniences attending the present method of giving air to such structures. Place a tube or trough perforated at the top, bottom, and sides, made of iron or wood, with the ends open to admit the air right through the building lengthways, and another across the centre of the house (see woodcut,) with wide mouths open to

AA, perforated tubes; BB, wide open mouths.

the four points of the compass, so as always to command a current of air from whatever quarter the wind happened to be in; they could have stoppers or lids, to be closed when not required; the long tube could run just under the upper plate of the house, and the cross one under a rafter: this would suffice for top air. Two others could be run through the entire length of the building, for ventilating the lower part, and could be placed under the stages. By perforating the tubes very finely, the air would be gradually diffused all over, and prevent a violent rush through the house. *J. R.* [But how is the air to *escape* from a house ventilated upon this plan?]

*Adulteration of Soot.*—I intimated, some time ago, that a sweep in a neighbouring village was carrying on a large trade in the adulteration of soot with sawdust. This morning the sweep and his foreman quarrelled, just as they had begun to unload a cart of sawdust. After a few words of a rough nature, "fists" were put in operation, when the master proved to be the best man; but while the foreman was taking to his heels, he turned round, and exclaimed, "You know you have been cheating the farmers for more than 12 months, by taking in 40 or 50 sacks of sawdust, and again selling it for soot, and I'll see you d—d before I work for you any longer, unless you give me higher wages." This scene took place in the presence of many spectators. I consider the adulteration of soot to be as bad as the guano case, for sawdust is poison to the roots of plants, until it begins to rot. Its price at the mills is just the carting of it away. *Dulwich, 29th April.*

## Societies.

Horticultural, *May* 20. — J. R. Gowen, Esq., Treasurer, in the chair. M. de Ysasi, Esq.; W. T. Egerton, Esq., M.P.; J. A. Houblon, Esq.; R. T. Clarke, Esq.; F. G. Nelson, Esq.; F. Scrivens, Esq.; J. Weston, Esq.; R. Taylor, Esq.; J. Tremayne, Esq.; Mrs. Tombs, and the Earl of Kilmorey were elected Fellows. Cut specimens of purple and white hybrid Rhododendrons from the open grounds at Combe Royal, near Kingsbridge, Devonshire, were exhibited by J. Luscombe, Esq. When first removed from the trees, they must have been very fine; but they were considerably injured by travelling. A Providence Pine-apple, weighing 5 lbs. 8 oz., was exhibited by Mr. Davis, of Oakhill, East Barnet, and a large basket, full of very good Black Hamburgh Grapes, for which a Certificate of Merit was awarded, was also contributed by the same grower.—Half a dozen Royal George Peaches, excellent for the season, came from Mr. Raith, gr. to Mrs. Smyth, of Ashton Court, Bristol. These received a Banksian Medal.—The Garden of the Society furnished a new pale greenish yellow Epidendrum from New Grenada; and Brownea Ariza, a Mexican stove tree with leaves resembling those of the Amherstia, and bearing a large drooping head of crimson flowers, which develope themselves for several weeks in succession. It was introduced by the Society some time ago through Mr. Hartweg, and is now flowering for the first time. The same establishment also contributed a white Azalea, Acacia pulchella, Boronia tetrandra, Chorozema varium, the two Californian Ceanoths—papillosus and dentatus; Diosma capitata, two Cape Heaths, the Indian Rhododendron formosum, which is sometimes called Gibsoni; the Chinese Indigofera decora, an Everlasting, the Myrtle-leaved Eutaxia, Anadenia pulchella, and the very pretty Bauera rubioides. It was mentioned that as the latter lives on the Hampshire Hills in Van Diemen's Land, where the winters are often very severe, it would probably be found to be hardy in this country.

National Floricultural, *May* 22.—Mr. Newhall in the chair. On this occasion both seedling and named plants were supplied in tolerable profusion and variety. Of Pelargoniums Mr. Beck's Incomparable was commended for fine colour, and Mr. Hoyle's Magnet and Herald were recommended to be "seen again." Among Cinerarias a certificate was awarded to Rosalind, a medium sized white flower with a grey disk, and narrowly edged with ultramarine blue. This was shown by Mr. E. G. Henderson, of the Wellington-road Nursery, St. John's Wood. C. Formosa, from Mr. Ambrose, was commended as a good marketable kind. It is a white ground flower, with a rosy purple tip. C. Nonsuch, a lilac purple self, from Mr. E. G. Henderson, was also commended by the censors. Some nice looking Calceolarias were produced by Mr. Gaines and others; but none were considered by the judges worthy of distinction. Pansy "Pandora," from Mr. Hunt, received a certificate. It has a bright yellow ground with a broad purple margin shaded with puce; surface smooth, and substance and shape good. A white ground seedling Pansy from Mr. Chater was commended. Nice exhibitions of this useful flower were furnished by Messrs. Turner, Bragg, Skynner, and Brown. A collection of Mimuluses came from Mr. Wyness, and another of breeder Tulips from Mr. Willison, of Whitby. Among the latter we remarked a finely-formed rose, called Juliet, with a very fine base. Gloxinias, Cinerarias, &c., were exhibited by Mr. E. G. Henderson, Wellington-road, and miscellaneous plants by Messrs. Henderson, Pine Apple-place, and others. Fancy Geraniums were plentiful; and conspicuous among other things on the table were a straw-coloured Rhododendron, and a pink Azalea, stated to be a hybrid between a Rhododendron and an Azalea.

Highbury and North London Horticultural, *May* 15.—This Society, which is only two years old, bids fair to take a prominent position. Plants, flowers, fruits, and vegetables, were much better this season than last. Stove and greenhouse plants, Ericas, Pelargoniums, Orchids, Azaleas, Roses, Pansies, Verbenas, &c., were all more or less represented and contested by the members (private growers), Messrs. Chapman, Venn, Scott, Lochner, Edwards, and others. Liberal prizes were also offered to the trade, and Messrs. Fraser, Pamplin, Paul, Bragg, and Francis were among the competitors, producing, collectively, stove and greenhouse plants, Azaleas, Heaths, Pelargoniums, Roses in pots, specimen plants, &c.: while to Mr. Cole, gr. to H. Colyer, Esq., Dartford, extra prizes were awarded for his productions, because of their excellence. Every praise is due to the working committee for the uniformity and well managed arrangements of the subjects submitted for competition, warranting the remark which was current, "that it was quite a Chiswick *fete* in a small way."

## Notices of Books.

*A Practical Treatise on the Culture of the Vine.* By John Sanders, Gardener to T. A. Smith, Esq. 8vo. Reeve and Benham; pp. 31.

Mr. Assheton Smith's place at Tedworth has long possessed a great English reputation for the excellence of its fruit and vegetables. One is continually hearing in society of the extraordinary abundance and perfection of its produce, at seasons when common gardens are empty; and the great world seems to have arrived at the conclusion that the kitchen gardening and forcing there are nowhere excelled. We have, therefore, examined with no common interest the work before us; for it would be strange indeed if the man who can act so skilfully as Mr. Sanders, should be unable to offer advice of corresponding value.

We have not been disappointed. Hackneyed as is the story of Grape growing, readers will always be attracted by a new work on the subject, especially in a country like England, where the aim of everybody is to know how a thing is done, rather than wherefore. In this case they will be fully satisfied. Mr. Sanders's directions are as plain as words can make them; and, we will add, as judicious as his long experience had led us to expect. After a very careful perusal of his little treatise, we find nothing to object to; and much to praise. Crotchets he has none. He seems to be a plain straightforward man, who tells his story in a plain straightforward way; and if he does not always appreciate the reason of his own success, at all events he teaches others how they may attain the same success as himself. Novelty there is little; and so much the better. The author's merit consists mainly in the sound judgment he has shown in selecting what is best in the practice of others, and in rejecting all sorts of doubtful schemes. Indeed, we are not sure that there is anything new in these pages, except what relates to trough-growing, a method, we believe, peculiar to Tedworth, concerning which we have full details. Our extracts shall, for the present, be limited to what is said upon that subject.

Trough-growing is a modification of pot-growing, but a great improvement upon it; and we understand that it has attracted much attention from Mr. Assheton Smith's friends. In the first instance Vines are struck from eyes and grown in pots as usual. Afterwards,

"When the buds are regularly broken, and each shoot advanced to the length of 6 inches, prepare to plant the Vines into a trough, as shown in the plan. The advantage to be derived is immense, by securing to them all the benefit of a border, independent of giving every root and branch an equal temperature, which is so essential to promote their perfection. First place upon the laths forming the bottom of the trough, a layer of pieces of turf of about 3 inches square, to prevent the fine mould from being washed down; next put a layer of 2 or 3 inches deep of the following compost, viz., equal quantities of rich turfy loam and rotted manure from the farm-yard, with the addition of a little sand. Proceed to remove the Vines from the pots by turning the ball upside down on the palm of the hand, having a convenient bench on which to rest the hand and ball whilst cautiously removing the crocks, and any objectionable soil, or worms, and taking the utmost care in so doing not to injure the roots. When so prepared, place the ball on the surface of the soil in the bottom of the trough. Proceed with another Vine, and so on till the whole are done, leaving a space of about 3 inches between the ball of each to be filled up with the same compost as used under them. Cover the surface of the roots about 1 or 2 inches deep; the soil, previously to being put round the roots of the Vines, must be warmed to the same temperature as the house. As soon as all are tied in their proper places, a good syringing will much assist them; but do not water at the roots for a few days, except it be absolutely necessary. If any water is given, let it be done by pouring it immediately on the balls.

"Before a week has expired after removing the Vines into the troughs, they will begin to show the benefit they are deriving from the change. When sufficiently advanced, stop each shoot one joint beyond the fruit, and leave only one bunch to each, and from eight to 12 to every Vine, according to their strength. A heavier crop would deteriorate both from the size and colour of the berries. A plentiful supply of water will now be necessary, which can be given abundantly without fear of injury from stagnation; provided the directions given for the formation of the trough have been strictly attended to."

We shall probably revert to Mr. Sanders' treatise, which, in the meanwhile, ought to be found among the books of every thinking and working gardener in the United Kingdom.

## Garden Memoranda.

Mr. Groom's Tulips.—These are just now in perfection, and we can promise our readers that a sight of them will amply repay a visit. The best bed, 120 feet long, and containing not less than 2000 flowers, is as fine as we have ever seen it. We observed the following favourite sorts in good condition. Roses:—Catalani, Countess of Wilton, Duchess of Sutherland, King of Saxony, and Camuse de Craix. Byblœmens:—Claude, Imperatrix florum, Michael Angelo, Parmegiano and Queen Victoria. Bizarres:—Duke of Devonshire, Lord Sandon, Duke of Norfolk, Marshal Soult, Nourri-Effendi, Prince of Wales, and Prince Albert. But in addition to fine old kinds the bed contains several novelties of merit. Dr. Horner (Bizarre) proves to be a first-rate second row flower, and we also remarked a very fine rose, called Fleur de Marie, in which the feathering is very boldly delineated. The less important beds in the open ground are also just now in full bloom, and make a brilliant display.

Messrs. Weeks and Co.'s Nursery, King's-road, Chelsea.—Early in April we stated that an attempt had been made here to cultivate the Royal Water Lily in an open heated pond. The plant is in excellent health; it opened its first flower on the 16th, and when we saw it on Tuesday last, another flower bud was swelling fast. The leaves (five in all) measure 3 feet 6 inches across. The plant, however, cannot as yet be said to have been grown in the open water, for up to the period of its blossoming it was covered with a frame whose sides dipped into the pond. This was entirely removed for two days, about flowering time; but for fear of injury from cold winds, which have prevailed so much of late, a temporary erection, closed in with lights, and surrounded with canvas, has been thrown over it. It is, however, intended to clear all away, and leave the plant fully exposed, as soon as the weather has become sufficiently warm. From what has been stated, it will be gathered that the experiment is yet in its infancy; but there are certainly good grounds for anticipating a successful result.

## Miscellaneous.

*Babington's Plan of Preventing Incrustation of Steam and other Boilers.* (Patented November 7, 1850.)—This invention consists in the application of voltaic agency for preventing incrustation in boilers, by connecting to the interior of such boiler a plate of some metal more susceptible of oxidation than that of which the boilers are composed, and in such a position as to be wholly immersed when the water in the boiler is at the usual level. The patentee recommends for iron boilers a plate of zinc of the ordinary description, and of the weight of 16 oz. to the square foot, which should be attached by one of its edges, by means of solder, to the interior of the boiler, and that the proportion which such plate should bear to the immersed surface of the boiler should be one-fifteenth, reckoning one side only of the zinc plate. Both sides of the plate being left exposed to the action of the iron and the water in the boiler, the voltaic agency thus excited is found to produce the desired effect. For large boilers, two, three, or more plates are recommended, the relative proportions above stated between the surface of the plate and that of the immersed portion of the boiler being maintained. When the zinc plates are corroded, as

they will be found to do, though but slowly, they are to be removed and replaced by others (no claims.) *Mechanics' Magazine.*

*Grant's Improvement in Heating and Regulating Temperature: Patented Oct.* 24, 1850.—These improvements relate to the construction of furnaces and apparatus for heating water or fluids, and have for their object the better regulating the application of heat and temperature of the fluid, as well as economising the fuel employed. For this purpose, the furnace and its flues are placed within the boiller, so that they, the furnace and flues, may be surrounded by, or immersed in, the fluid to be heated. A larger portion of heating surface is thus obtained. In order to insure a continuous supply of fuel to the furnace, a cylinder or tube is placed immediately above the grate of the furnace, and in this cylinder is kept such a store of coal or other fuel employed as will keep the furnace constantly and regularly supplied with the requisite quantity of fuel. The furnace grate is made of a conical form, the point of which projects upwards, so that the fuel may gradually descend or be forced towards the periphery of the grate to supply the place of that which has been destroyed by the combustion. Immediately above the periphery of the grate is a circular flue surrounding the receptacle for fuel, and extending up into the boiler as far as convenient, but leaving a space between the flue and the receptacle for fuel, into which a portion of the water or fluid to be heated may be admitted by tubes passing through the flues. At or near the top of the circular flue are inserted tubes or pipes, by means of which the gaseous products arising from the combustion in the furnace may be carried into the chimney; and the greater distance those tubes pass through the fluid to be heated, the more effectually will the caloric evolved by the combustion be absorbed, and the waste of it thus prevented. The ash-pit under the grate of the furnace is closed, but furnished with a door or doors, by the opening or shutting of which, more or less, the supply of air to the furnace may be regulated at pleasure. The regulation of the supply of air to the furnace will not only govern the amount of fuel consumed, but also regulate the temperatre employed in heating the fluid, the reservoir of fuel at all times containing such a store as may be needful for keeping up the combustion. When the furnace is in operation, and the process of heating a fluid in the surrounding boiler or vessel is going on, the heat of the circular flue will raise the temperature, and therefore diminish the specific gravity of the small portion of fluid in the space between the flue and the fuel reservoir so quickly that there will be a constant current of fluid up through that space; and in this way the greater, if not every, portion of the fluid will be made to come in contact with the heating surface by which it is to be heated. *Architect.*

*Death of Dr. Kunze.*—The continental papers report the death of Dr. Kunze, Professor of Botany at Leipsic. *Athenæum.*

## Calendar of Operations.

*(For the ensuing week.)*

### PLANT DEPARTMENT.

That interesting little tree, the Mandarin Orange, which flowers so freely during winter, may now be propagated by putting cuttings into a brisk top and bottom heat, under a close handglass. As soon as they are fairly struck, pot them off singly in rich light soil, and replace them in the glass for a few weeks, when they may be gradually inured to the light and air. Pinch out the points of the leading shoots frequently, to keep them dwarf. Orchids now require the most liberal treatment to induce them to fully develope their interesting characters. A good and healthy growth will be ensured by a warm humid atmosphere, with fresh air so admitted as to avoid draughts, and by shading with thin canvas during the brightest part of the day. In the afternoon the plants should be gently dewed over, using a syringe, with a fine rose for the purpose; we have often seen such work done with a coarse syringe, and the water driven through it with all the force possible; but such a practice is very injurious to the plants. Some of the stove plants, which commenced their growth earliest in the season, will soon be about completing it; and that it may be properly matured, they will require to be exposed to stronger light, and a freer admission of air than has been afforded them during their season of growth. These hints, at this time, will particularly apply to those winter-flowering plants which produce their blossoms upon the young shoots of the previous year's growth. Among these we may mention the delightfully fragrant and abundant blooming Franciscea, and the several stove species of Jasminum, especially the one known as J. multiflorum or J. hirsutum, than which a more charming winter plant does not exist, if it be grown very strong during the summer, and well ripened.

### FORCING DEPARTMENT.

Where Pines are grown on the planting out system, the soil should be entirely renewed once in 3 or 4 years. The time for this operation must be left to the judgment and convenience of the cultivator; but advantage should be taken of a time when all, or nearly all of the older plants in any pit have perfected their fruit, and this is a very favourable season for the purpose. The younger plants (which have been put in one after another, as vacancies occurred), after being well watered, should be carefully lifted with balls, and set in a close shed, while the soil is being changed. But if any remain of those which have already shown fruit, they may be left standing, with a small mound of earth about their roots; or, if not very far advanced, they may be removed with balls to the back row. If this is carefully done, the plants will not receive the least injury, but will rather be improved; for we always find them to progress much faster, after being moved with balls into a fresh bed of soil. The soil should consist of about one-third of the best peat that can be obtained, and two-thirds of rich turfy loam, with an admixture of sand, according to the requirements of the other materials. The plants of the back row should be planted, before the soil is put in for the second one; and the remaining rows proceeded with in the same order, to prevent all unnecessary compression of the soil. If the new soil is moderately moist, it will be better to withhold water from the roots for a few days, to allow the plants to commence rooting; and until they are fairly re-established, a moister atmosphere must be kept up, and the pits shaded rather more than usual. Vineries.—A liberal supply of air in these houses is the best preventive against scorching. In finally regulating the Grapes of the latest crops, which are intended to hang through the winter, rather more should be cut away than from those intended for earlier use, that the bunch, when ripe, may hang looser. This will detract a little from their appearance, but the free circulation of air amongst the berries will do much to preserve them from the effects of damp weather.

### FLOWER GARDEN AND SHRUBBERIES.

Attention should now be paid to the reserve stock, intended to supply the gaps which will occur, and especially in some of the beds which are filled at first with transient annuals, and which in the course of the season will require entirely renewing. To meet these demands, we prepare a bed of coal ashes rolled solid, and lay upon it two or three inches of soil composed of chopped turves, leaves, and coarse sand; in this we prick out young plants, of such kinds as are likely to be required, at distances of from 4 to 6 inches asunder. In the preparation of plants for flower garden masses, we have tried various methods of economising labour and materials, and, for several years, have adopted this as the best. By it the plants become established much sooner, and the cost of many thousands of small pots is annually saved. As the planting out will now be nearly finished, let all the beds be gone over, picking out weeds, pegging down, or tying up such as would blow about with the wind, and giving them every possible assistance, to enable them speedily to fill the beds. Herbaceous plants of all kinds are now growing rapidly, and many of them, unless immediately supplied with stakes, will have grown out of all shape, or the wind will blow them about and break them. Make everything in this department clean and tidy; and keep the turf and walks in the neatest order. Spare hand lights and frames may be placed in shady situations, and made use of for propagating double Wallflowers, double Rockets, choice Dianthuses, Phloxes, Iberis sempervirens, and many other select herbaceous and half-shrubby plants.

### KITCHEN GARDEN.

Let all possible encouragement be given to growing crops of every kind, by supplying them freely with liquid manure. Asparagus, especially after being severely cut, should have every assistance to enable it to recover. Handlights should now be placed about a yard and a half asunder, upon the trenches which are prepared for ridge Cucumbers and Vegetable Marrows, and the plants carefully turned out the first dull day. It will be necessary that their watering be regularly attended to, and every fine evening they should be sprinkled over the foliage with a rose pot, till they are so far hardened as to admit of the covering being removed. A few Vegetable Marrows or ornamental Gourds may, with the strictest propriety, be planted against any spaces on the fruit walls which are unoccupied. The stations should be prepared for them by making large holes, and placing therein a couple of barrowsful of decomposed animal or vegetable manure, merely covering this with sufficient of the original soil to receive the plant.

### HARDY FRUIT GARDEN.

The summer pruning and thinning of all fruit-bearing plants is a vast improvement upon the common practice of allowing them to grow wild until winter. The superiority of the fruit, when this practice is adopted, is very striking, and an additional advantage consists in the work being done in half the time that it would require in winter. Tie in or nail the leading shoots of Pear trees as they require it, but do not, even for the sake of neatness, stop all the shoots, lest by so doing the natural fruit-spurs for next season are forced into wood-spurs; the former are readily known by their short thick stunted appearance, and instead of producing a shoot, only produce a bunch of from four to seven leaves. Young trees which are being trained into pyramids or other shapes, should be examined once a fortnight, and the shoots which are not wanted should be pinched in with the thumb and finger, by which the growth of others will be encouraged. This process should commence with the upper shoots, that the sap may be directed into the lower branches; and after an adequate quantity of shoots of sufficient strength is secured to form the lower part of the tree, the leading shoots may be allowed to grow and furnish wood for the top. Stopping for wood is very different from stopping for the purpose of forming fruit buds; for the latter purpose it will be time enough to shorten the shoots a month hence. Gooseberries and Currants should have their young wood thinned out by immediately stopping at least half the number of shoots to four joints, to allow the air to circulate more freely in the centre of the bushes; and the remainder of the shoots should be stopped during the summer, according as the shape of the plant requires it. This practice will almost entirely do away with winter pruning, while the flavour and size of the fruit will be greatly improved.

State of the Weather near London, for the week ending May 17, 1851, as observed at the Horticultural Garden, Chiswick.

## Notices to Correspondents.

Back Numbers. 1s. each will be given for Nos. 48 and 49, 1848.

Canaries Breeding in the Open Air: *D.* We are not at all surprised at the importance you attach to our last week's article on this subject. It has excited, as we expressed our belief it would do, universal attention. The numerous questions however, connected therewith, which you now ask, would involve in the necessary reply an amount of space at least double that which has been already occupied. Suffice it to say, these questions have been anticipated and provided for; but, for the present, the further consideration of the subject must stand over. We have still stronger and more immediate claims urged on us by the migratory "warblers," whose sojourn amongst us will, alas, be but too short! Meantime we promise that the winter habits of the emancipated canaries shall not be lost sight of, at the proper season. *W. K.*

Emigrants: *A B.* You must plant your Vines in a Ward's case: there is no certainty about conveying them otherwise: and little probability of success. Why raise Deodars from cuttings, when seeds are so plentiful? It may be done, but is not worth doing, as the plants never thrive.

Fumigators: *WC.* You should not send notices to a newspaper if you do not wish them to be made public. We thought your plan suggestive enough to deserve publicity; and that is all we can say about it.

Lilies: *W G.* Your plants do not flower because they are too weak. Give them manure water from time to time till the month of August, after which let them alone. Lilies of the Valley like a little shade.

Melons and Cucumbers: *J Fits.* If these are planted together in the same box, they will fertilise each other, and become hybridised.

Names of Plants: *Seleucus.* We do not see how it differs from Viola canina.—*W M D.* We believe it to be D. transparens; but a single withered flower is hardly sufficient to enable us to speak positively.—*K.* 1, Pedicularis sylvatica; 2, Ajuga reptans.— *Correspondent.* Edwardsia grandiflora. Clematis montana flowers in March and April.— *E T C.* Genista anglica, or Petty Whin.—*G A B.* We do not know; probably some plant allied to Rigidella, and worth growing. Treat them like Cape bulbs.—*W Pass.* The plant called Scuticaria Hadwenii bears the same relation to Scuticaria as a turkey to a cock. It is a species of Bifrenaria which we had not previously seen.—*J W.* Fuchsia arborescens, an oldish plant, which we have not seen for many years. Will Mr. W. give us a cutting or two of it?—*D M.* We do not see why Major Madden's Dendrobe should not be D. fimbriatum.—*T D H.* We are quite unacquainted with it. It is not D. Griffithianum. We should be happy to have it figured for "Paxton's Flower Garden." We have no idea what Hippeastrum you describe. —*Sub.* Vaccinium amœnum, white Rhododendron ferrugineum.—*Mary Anne.* We never name florist flowers.*—A few inquiries stand over for further consideration.

Nightingales: *Amelia Herapath.* Your bird's sulkiness arises from your having in some way offended or slighted him. These birds are by nature quite as jealous as the gentle sex; but, fortunately, rather more easily reconciled when offended. Pay him, therefore, henceforward, the most constant and marked attention, and let him *see* your affectionate fondness for him. You will then possess his undivided heart—a conquest worthy of achievement. *W. K.*

Pear Leaves: *Woolton.* The appearances are very puzzling. If you look at the under side of the leaves, you will see that each pustule has a small hole in the centre; but the leaves are too young for anything to have escaped; and we cannot find anything inside the pustules. Will you watch and report progress?

Pears: *J E M.* Where the name *Colmar* appears in Frui. Catalogues, it is understood to apply to the original Colmar Pear.‖

Pelargoniums: *F G.* That is our deliberate opinion. We have long thought so, as you must have remarked, if you are a reader of this Paper. The Pelargonium mania, and the preposterous prices charged for distinctions without differences, can only be compared to the old Dahlia mania, now exchanged for rationality, and to similar follies, which rapidly work their own cure. As far as we are able to judge, some of the growers have struck a new vein; and, if they obtain distinctly new races, Pelargoniums may again come into vogue. In the meanwhile, the uninitiated pass by the so-called novelties, which are just like the old sorts, and fix their attention upon the "fancies" in which something really novel is evident. For ourselves, we can only say of the former, *tædet quotidianarum harum formarum.*

Vines: *Amateur.* Spot arises from Grapes receiving more watery sap than they can reduce by evaporation. Your house wants to be warmer, and better ventilated in the day; or else your border requires to be drier. At all events, the immediate cause is what we state; of the remote cause we have no means of judging. You will find the management of Cameline, or Gold of Pleasure, in our vol. for 1848, p. 677.

Misc: *C A T.* Ceanothus azureus is not quite hardy. It flowers beautifully in the south on a conservative wall, where it has a little protection in winter. The Chinese Wistaria is perfectly hardy.‡

### SEEDLING FLOWERS.

Pansies: *R P.* Your flower has improved considerably since we saw it last. The only fault at present appears to be the eye running into the margin of the lower petal.*

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS,

AS THE

ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by Dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

GUANO AND OTHER MANURES.—Peruvian Guano of the finest quality; Superphosphate of Lime; Gypsum; Salt; Nitrate of Soda; Moffat's Patent Concentrated City Sewage Manure, and all others of known value.—Apply to MARK FOTHERGILL, 204, Upper Thames-street, London.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

| | | | | |
|---|---|---|---|---|
| Clover Manure, per ton ... ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

NEW TURNIP MANURE, 50s. a Ton.—Mr. POTTER can strongly recommend the above as a cheap and efficient Manure, and capable of raising heavy crops. Delivered free on rail. The Bags to be returned or paid for.

POTTER'S GUANO, 7l. per ton; SUPERPHOSPHATE OF LIME, 6l. per ton; GYPSUM, 25s. per ton, including bags and delivery on rail.—28, Clapham-road-place, London.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9l. 10s. per ton, or 9l. 5s. in quantities of 5 tons and upwards.

EDWARD FURSER, Secretary.

40, Bridge-street, Blackfriars, London.

MR. J. C. NESBIT, F.C.S., F.G.S., Consulting and Analytical Chemist, Laboratories, 38, Kennington-lane, London.—PRIVATE INSTRUCTIONS in Chemical Analysis, and the most approved methods of making ARTIFICIAL MANURES. Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

TAN (Gratis), fresh from the pits.—Apply to ESSEX and SONS, 28, Stanhope-street, Clare Market, London, in the immediate neighbourhood of Covent Garden.

HOSE FOR LIQUID MANURE, Fire-engine, and agricultural purposes, made of canvass, lined and coated with gutta purcha; it is about one-third the price of leather or india-rubber, will convey liquids of all kinds under a heavy pressure, it is extensively used at the Government public works; also by the navy, and amongst agriculturists, giving universal satisfaction. Testimonials and prices may be obtained of Messrs. Burgess and Key, 103, Newgate-street, sole manufacturers.—London Agents: Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.—Country Agents: Messrs. Ransome and Parsons, Ipswich; Messrs. J. and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. S. Wilson, Agent for Scotland.

THE METALLIC PAINT, produced by the Patent Alkali Company, has been extensively used for several years on farm-buildings, iron bridges, roofs and railings, shipping, &c., and it is admitted that it covers a greater surface and stands far better than any other pigment on wood, iron, Abethaw Lime, and Roman Cement. Fine Black, 25l. per ton, and Rich Purple-brown, 20l. per ton.—Offices of the Company, 1, New Broad-street, London.—JOHN A. WEST, Secretary.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING

Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Burhhil-row, London, where Roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance of Westminster Hall, were roofed with F. M'NEILL and Co's Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than thy require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND is desirous of receiving Tenders from Innkeepers or others, to contract for the supply of a Cold Dinner for 2000 persons, in the Society's Pavilion, in the Home Park, Windsor, on Wednesday the 16th of July, 1851. Printed forms of Tender may be obtained on application to the Secretary, at the Office of the Society, No. 12, Hanover-square, London; and they must be returned to him, filled up, on or before Monday the 9th of June, 1851, the Society, however, not binding itself to take the lowest Tender.—By order of the Council,

London, 24th May. JAMES HUDSON, Secretary.

TO TURNIP GROWERS.—Observing the great superiority of some sorts of Turnips, both as to bulk and nutritive properties, J. SUTTON AND SONS have for many years paid especial attention to that important agricultural root; and have carefully tested the comparative merits of many varieties, *they can with the greatest confidence recommend the sorts named in their Advertisement in the 1st page of this week's Paper*, where the prices are also quoted (carriage free).—Address, JOHN SUTTON and SONS, Seed Growers, Reading, Berks.

TRANSPLANTED TURNIP SEED.

R. JOSLING begs to offer to Agriculturists his very excellent variety of PURPLE-TOP SWEDE, a cross between the Golden Melon and the Liverpool, decidedly one of the best in cultivation—a heavy cropper, stores well, best quality, seed warranted growth of 1850, from Transplanted Roots, at 1s. 3d. per lb.

All orders of 25 lbs. and upwards carriage free to any Railway Station in England, or packet office in London. A remittance must accompany the order.

ROBERT JOSLING, General Seed Warehouse, St. Alban's, Herts.

SKIRVING'S IMPROVED TURNIP SEEDS.

WM. SKIRVING begs to announce to his friends and the public, that he has fixed the price of his IMPROVED SWEDE, and also the PURPLE-TOP YELLOW-BULLOCK, at 9d. per lb.

In consequence of W. S. having extended the growth, and having had a very abundant crop of the Seed of his Improved Turnips, he is this season able to offer it at the above reduced price, and he is also induced to take this step to prevent Agriculturists being imposed upon by the sale of spurious Seeds, offered at a low rate, under his name.

W. S. can, with perfect confidence, recommend these Turnips as being the best now in cultivation, in every respect, whether for the greatest crop, the best quality, or for keeping, according to the time of sowing. All other Agricultural Seeds, of the best quality, at very moderate prices. A remittance, or reference, is requested from unknown correspondents.

N.B. W. SKIRVING has no Agent in town or country.

Queen-square, Liverpool, May 24.

# The Agricultural Gazette.

*SATURDAY, MAY* 24, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, May 28—Agricultural Society of England.
THURSDAY, — 29—Agricultural Imp. Soc. of Ireland.
WEDNESDAY, June 4—Agricultural Society of England.
THURSDAY, — 5—Agricultural Imp. Soc. of Ireland.

An opinion is very general among the farmers and landowners, that they would derive great advantage from an alteration of those fiscal regulations which prevent them from growing Tobacco and sugar. We do not participate in these views. To begin with Tobacco: If the cultivation of it were ever so profitable, and if the total quantity consumed in the United Kingdom were raised there, it would not occupy more than 28,000 acres; and what, we would ask, would that be among the cultivators of the 20,000,000 of acres of arable land in the United Kingdom, to say nothing of the 37,000,000 of acres of meadow and pasture, out of which some of the Tobacco land would probably be taken? We have about 40,000 acres under Hops; and what benefit do the farmers beyond the Hop districts derive from the withdrawal of those 40,000 acres from the production of corn, meat, and wool? It is even questionable whether the Hop culture is advantageous to the Hop districts themselves. Tobacco, again, requires the very best land; the average produce does not exceed 1000 lbs. to the acre; its cultivation involves a great amount of labour, and the price of foreign Tobacco in England does not exceed 7½d. the lb., exclusive of duty. The profit of Tobacco cultivation in Britain would, therefore, depend on the maintenance of a high protecting duty in favour of Tobacco of home growth, to the greater benefit of the smuggler than of the agricultural interest. The whole question underwent a very careful examination a few years since, by a committee of the House of Commons appointed to inquire respecting the cultivation of Tobacco in Ireland; and it was proved incontestibly, that with labour as low as in Ireland, British Tobacco, paying an excise duty of 1s. the pound, would be unable to compete with foreign Tobacco, subject to the present import duty of 3s.; and that the competition would be equally hopeless were both free of duty. In the latter case, a revenue of more than four and a quarter millions sterling, levied on the superfluous expenditure of the masses, and producing within a million and a half of the amount of the income tax, must be sacrificed to enable British farmers to grow Tobacco which none of them would smoke, even though they could obtain it 3s. a pound cheaper than the foreign. The Tobacco grievance is, therefore, rather imaginary than real.

The cultivation of Beet-root, for sugar making, is not quite so hopeless; and that is nearly all that can be said in its favour. Those who desire information respecting it should consult the work of Sir R. KANE, on the "Industrial Resources of Ireland." While including it among the resources of his country, he includes it with some hesitation, and it must be confessed that he has not placed it in a very inviting point of view. He has reduced to English weights and measures the information collected by DUMAS for the French Government respecting the Beet-root sugar statistics of France; and the results are not such as would tempt us to embark either in the manufacture or in the raising of Beet-root for sale to the manufacturer. Even in France, where the climate is more favourable than that of Britain to the production of sugar, the manufacture has been fostered by peculiar circumstances; it is felt to be disadvantageous to the community; and were there not a native sugar interest already established it would not be deemed desirable now to introduce it. It appears that the crop most productive of sugar does not exceed 12 tons to the acre. Thirty or 40 tons may be forced by high cultivation, but in that case the carbon goes to the formation of woody fibre, not sugar; so that the smaller crop is ultimately the more profitable. For these 12 tons the manufacturer could not afford to pay more than 16s. 8d. the ton. At that rate, the prime cost of the sugar, coals costing 12s. the ton, would be 26s. 8d. the cwt.; and that after giving the process credit for the refuse pulp, one-fortieth part of the whole, at 6s. 3d. the cwt., as cattle food—for the skimmings of the boiler, as manure, at 6s. the cwt.—and for the treacle at 1s. 8d. the cwt.

At the time these calculations were made, the average price of colonial sugar, exclusive of duty, did not exceed 31s. the cwt.; and amidst the subsequent alterations of duty, and the various regulations for the admission of foreign to competition with colonial sugar, it is certain that the price has not advanced. With Beet-root and cane sugar, therefore, subject to the same duty, it is evident that there is no very great inducement to embark capital in the manufacture; and as to the cultivation, we should, for ourselves, prefer a crop of 30 tons of Mangold Wurzel, consumed by cattle on the land, to a sugar crop of 12 tons yielding only 10l. an acre, delivered at the works—a crop requiring, moreover, much labour and some manure, and making no return of the latter to the land, except such as would be purchased out of the gross returns. The purchase of this manure, whether consisting of the refuse of the manufacture, or of 3 cwt. of guano, would make a deduction of 30s. the acre from the 10l. The cultivation of the Beet-root and the manufacture of the sugar have been treated as if carried on by different parties, not only for the sake of clearness, but because the sugar would be produced more economically under that division of labour than by the incongruous combination of the trades of farmer and sugar-maker in the same hands. It must be borne in mind, that in these calculations, coals are only charged at 12s. the ton, or about half their price in the southern counties, where conditions of climate prevail more favourable to the production of sugar than in the northern counties, in which the principal colleries are situated, and where coal is about 12s. the ton, at a few miles from the pit.

Such are the prospects of sugar growing in Britain. We are sorry they are not more favourable, because, if it were possible profitably to raise the natural produce of the tropics under our sunless skies, it would furnish a very comfortable solution of the African and cheap sugar questions. On these we are, at the present day, in the same awkward predicament between conscience and convenience, described by COWPER at the commencement of the movement against negro slavery:—

> I own I am shock'd at the purchase of slaves,
> And fear those who buy them and sell them are knaves;
> I pity them greatly, but I must be mum,
> For what could we do without sugar and rum,
> Especially sugar, so needful we see.
> What! give up our desserts, our coffee and tea!

We rejoice, therefore, that the experiment is about to be tried by the establishment of a Beet-root Sugar Company in Ireland, to which we wish all success. There is nothing like testing theory by actual practice, and we strongly recommend those farmers and landowners who think that they would gain by exchanging the production of corn and cattle for that of sugar, to look before they leap—to make themselves practically conversant with the details and profits of the process by taking a few shares in that company before they embark individually in the growth of Beet and the manufacture of sugar. At present there is a great dearth of employment for farmers' sons. The area of the British Isles does not increase with the expansion of the agricultural family. All the sons are brought up farmers, and hence that competition for land which forces up rents and leaves so little margin for the farmer's profit, be prices what they may. It will be different should sugar making succeed. The sons can then play into one another's hands; one can grow the

Beet, another can buy it of him and make the sugar. We have great doubts, however, whether sugar-making will ever engraft itself on British agriculture. If our farmers desire more remunerative employment than that of raising bread and meat for an ungrateful country, which sacrifices patriotism to appetite, prefers the cheap to the remunerative loaf, regardless of whence it comes, and persists in eating its way through the masses of grain with which the foreigner vainly endeavours to smother it, let them turn their attention to Flax. They will find it a better speculation than sugar or tobacco. This is said without reference to the recent inventions for preparing Flax as a substitute for cotton. Successful as we believe them to be, an important element of success appears to be a price of cotton above its ordinary level. Irrespectively, however, of these modern inventions, our Flax mills require for the ordinary purposes of Flax spinning an annual importation of 1,000,000 cwts., which cannot be valued at less than 2,000,000*l.* sterling. Our soil and climate are as propitious to Flax as they are unpropitious to sugar and tobacco. In these respects we have the advantage of every country in Europe and America, except Belgium. Let the British farmer then drive the foreign Flax grower out of the home market, before he invades the tropics, and turns his arms against Cuba and Brazil, Virginia and the Mauritius.

## REPORT ON THE AGRICULTURAL SECTION OF THE GREAT INDUSTRIAL EXPOSITION OF THE NINETEENTH CENTURY.

No. III.—CULTIVATORS or SCARIFIERS are shown in great variety, each maker having done his best to contrive a good form of tooth or tine, to fasten and arrange the teeth in the most useful and efficient manner, and to scheme the simplest and easiest method for lifting or lowering the frame which contains them. And all are constructed entirely of iron, with the exception of some of the wheels. J. Bendall, of Woodbridge, shows a useful implement called a patent universal self-adjusting cultivator, for skimming, cleaning, pulverising, or subsoiling land. It has eight tines fixed in mortices in a strong frame, which is cast in one piece. The machine is raised upon two wheels by a bent axle turned by a lever, this giving a pull very much like that in a printing press—the purchase greatest at first, when it is most wanted. There are two small wheels in front of the scarifier, the axle being attached by a joint to an upright spindle; thus being able to accommodate itself to inequalities of the land. The tines carry double-winged shares.

R. Beart's patent cultivator seems entitled to rank in the first class. The frame is a triangle of cast iron; the tines are fixed in the same way as in the Uley cultivator, and the method of raising is the same as in that excellent implement—with an improvement. The objection to the Uley wheel and screw is the length of time occupied in turning it; if the simple parallel motion could be effected by the mere depression of a lever handle, it would be the best movement yet invented for the purpose. And this has been attempted in the present case. A smaller pinion, working in that on the wheel axle, is turned by a lever; but while time is saved, the distance raised is, perhaps, not so great as in the Uley drag. To Beart's cultivator are attached two immensely heavy rowels, which either ride upon the frame to weight it, or run behind to break the larger clods.

A cultivator, by W. Nicholson, of Newark, is lifted in a singular manner. The three wheels support as many upright bars, which pass through slots in the frame furnished with friction rollers. On the top of each bar is a semicircle, the two hinder ones fastened upon an axle, and connected with the foremost one by a connecting rod; and as they all move simultaneously by a lever behind the machine, the frame is raised or lowered by chains passing round the semicircles.

H. Carson, of Warminster, Wiltshire, has invented a scarifier, with a very simple parallel action for raising. A single pull of a long lever effects the movement, but as the whole draught of the horses is opposed to the direction in which the frame is lifted, we should say the pull would have to be both "long and strong." The tines are fitted into mortices with iron wedges—the frame is all cast in a piece. R. Coleman, of Chelmsford, has a patent scarifier or drag, in which each tine works on a bolt hinge, or joint, in a mortice. A lever on the top turns a barrel or spindle, which, by connecting rods, raises the tines forward all together. This, we should think, is not on a good principle, as the joints would wear, and the teeth become unsteady.

Smith and Co., of Stamford, Lincolnshire, have a scarifier, in which the operation of lifting it out of the ground is rendered more easy, by the addition of a weight in connection with the lever; but we can hardly approve of any contrivance that introduces unnecessary weight and complication into the machine. The tines fit upon the side of the frame bars, and are screwed tight.

H. Cowan, of Costorphine, near Edinburgh, exhibits a two-horse grubber, which obtained the first prize at Edinburgh in 1848, and at Glasgow in 1850. The tines fit by studs upon their sides into mortices in the bulls or bars of the frame. They cannot be set higher or lower. The lift is very simple, but we fear not sufficiently gradual to be done with ease. Ransomes and May show Biddle's scarifier, and their West Indian cultivator. The forms of both are well known; the former being decidedly the rival of the Uley cultivator, as regards its working capabilities, though not so simple in form and mechanism. The Indian cultivator is undoubtedly a good implement; but its double frame gives it a needless complication.

Among the great improvements now struggling to get introduced into general farm practice is, the autumn cleaning of Wheat stubbles; and our implement manufacturers have determined that the fault shall not rest with them, if this system is not speedily carried out wherever practicable. For they have designed several sorts of skim and paring ploughs with which to commence operations; and we are happy to say that all the specimens appear calculated to answer their purpose in a satisfactory manner. Mary Wedlake and Co., Hornchurch, Essex, have made a double-beamed wooden plough, carrying two iron skeleton ploughs, with single winged shares lying one way, one following the other, and both furnished with coulters. E. Hill and Co., of Brierly-hill Works, near Dudley, exhibit their skim for paring stubbles, turf, &c., consisting of two broad angular shares or knives with the wings facing each other, and just crossing the centre line, one being a little before the other; these are supported by a frame of the very lightest, and yet sufficiently strong kind, carried on three wheels. A tine shod with a wide chisel or tool precedes them in the centre line; and two curved tines follow, one behind each share, for the purpose of breaking the soil into smaller portions. This has the effect of exposing the roots of weeds, &c., more perfectly than would otherwise be the case to the action of the sun, thus preventing, if possible, their growing again. These coulters or tines are suspended from the ends of two short levers, and slide up and down in slots, so that either of them can be lifted out of work instantaneously. The implement possesses simplicity of construction, will easily work three acres per day with a pair of horses, at a moderate depth; or may be employed as a scarifier, if required, 8 or 9 inches deep. By bearing on the handles the knives rise out of the ground, to facilitate the turning. John Smith, of Uxbridge, has also a skim or paring plough having two somewhat similar shares, but without the tool in front. Two curved tines follow the shares, and are thrown out of work by "Lomax's patent movement," a combination of levers so contrived that though the tines can be turned up backwards with the greatest ease, without pressing spring or withdrawing bolt, they have no purchase to move out of work of themselves.

Perhaps one of the best implements for stirring or moving land that has been once ploughed, is the "Patent broad-share and subsoil plough," invented by E. H. Bentall, of Heybridge, near Maldon, Essex. The beam is of iron, long and straight, and in section of this form ⊥, having a small wheel at its fore-end. Two hollow square arms are screwed on at each side above the plough body, and opposite each other, so as to form a transverse beam about 4 feet long, being very light and strong. The body of the plough consists of a cast-iron plate somewhat resembling a solid land-side, and as thin as consistent with its strength. It carries a chisel point in front, a wide double-winged share behind, of peculiar shape, and two horizontal blades one above the other projecting on each side of the main plate or body. Two strong cultivator tines are fastened upon the transverse beam; they are serrated behind towards the top, and are nipped by staples and screws to the face of the beam, the upper side of which has a projecting edge fitting between the teeth on the tines, this allowing of their being set higher or lower. There are many holes in the beam, through which the two staples can pass, to set the times closer or further apart. These tines have chisel points, and carry angularly placed cutters or double-winged shares behind them. By means of all these points and cutters, the soil is first broken up and then divided into small portions. The novel arrangement of placing the broad-share at the heel of the plough instead of in front, seems calculated to render its action more easy, the soil being shaken as well as cut by the chisel-point and plate preceding it. This implement appears capable also of working as a regular subsoil plough. Ransomes and May have a patent implement of a similar kind; only two additional bars or short beams are placed one at each end of the transverse beam, and parallel with the main beam. Upon these bars the tines are fixed, carrying chisel-points, followed by V shares, point foremost. The tines are fastened in a very simple manner; they are nipped against the flat side of the bar by a screw bolt passing through; a square iron plate held by the same screw, keeps the tine in its upright position by four studs, one on each side the tine both above and below the bar.

Of SUBSOIL PLOUGHS there are not many beside the old forms already well known. Messrs. Wilkie exhibit that invented by Mr. Smith; and Ransomes and May show the Rackheath subsoil-plough, which will perform the operation of breaking up the ground to the depth of from 10 to 16 inches below the surface, and when preceded by the common plough (as ought to be the case), reaching to that depth under the bottom of the furrow. Several other makers have specimens of this kind of implement, which is invaluable for breaking up the pan formed by long continued ploughing, and allowing the water to percolate freely through the bottom of the furrow. One of the simplest and easiest is Read's Patent Subsoil Pulverizer. This consists of a straight beam, furnished with a pair of handles, and carried upon four wheels, the leading pair being placed near the cock, and the following pair near the after end of the beam. The stirrer or chisel-pointed share is let down through a mortice in the beam immediately behind the after pair of wheels, and set to any required depth. By this simple plan the entire weight is carried on the four wheels, which run parallel in the furrow made by a common plough, and preserve an even action of the stirrer below the bottom of the furrow. This plough may also be used as a mole-plough, or as a broad-share plough; and, by the addition of a frame, becomes a horse-hoe or scarifier. J. Blight, of Edinburgh, exhibits "an improvement" upon Read's, by the Marquis of Tweeddale, called a "subsoil trench plough." The difference is in the shape of the share, this being angular and larger, and with a broad tail sloping upward, so as to raise the broken subsoil to the surface. The most extraordinary looking implement for the purpose of stirring the subsoil is the "revolving subsoiler" of R. J. and R. Laycock, Newcastle-on-Tyne. A square frame, with shafts before and handles behind, holds on an axle in its centre a large wheel which carries a number of long harrow tines or teeth in pairs upon its periphery. These teeth are curved, and seem adapted for piercing and breaking up the bottom of a furrow. When out of work the machine rides upon two carriage wheels.

Among the ploughs are to be seen here and there specimens of the great monster implements used for bringing up the subsoil and mingling it with the surface-mould,—as in the peat fens, where the clay lies sufficiently near, and in districts where an underlying stratum of clay or marl offer a ready means of manuring the exhausted soil above, or of changing its texture and qualities. Ransomes and May exhibit an immense double-breasted plough for trenching, each mould-board being in two pieces, joined by hinges. It is intended to act upon the land in the same manner as double digging, to the depth of from 18 to 20 inches. By removing the left-hand frame it can be used as a draining plough, opening drains to the depth of 20 inches or more if required. *I. A. C.*

## THE CULTURE OF FLAX.

THE successful cultivation of Flax requires a deep, warm, moist loam—a mellow, loose alluvium, in which there is much humus or vegetable mould, the bottom not too dry nor too moist. It is therefore not suited for hot gravelly soils, or cold wet clays; but any other soil may be so tilled and prepared as to produce good Flax. The plant thrives well in the rich alluvial land of Zealand, and it is also raised with great success in the light sands of Flanders, but much more careful tillage and manuring are required. The land must be clear of weeds, and in good heart, for the growth of Flax; and the weeding of the crop forms a very important part of the expense of cultivation. These circumstances suggest the best mode of preparing the land. The heavier loams may be prepared by a deep and well-wrought summer fallowing with an ample quantity of well-rotted manure; but the universal cultivation of green crops, as Potatoes and Beet, supersede the necessity of a bare fallow on the stiffest loams, and prepare the land for bearing Flax. Much manure is required, and well-rotted manures suit best for Flax, as peat-ashes, ashes of weeds and earths, and the sweepings of streets in towns, the emptyings of privies and the cleaning out of the butchers' stalls and shambles. On light soils much manure is required; and, where night-soil cannot be obtained in sufficient quantities, Rape-cakes, from which the oil has been expressed, dissolved in liquid manure, form the best manure. In many parts of Flanders 500 Rape-cakes are used for every acre of Flax, besides the usual quantity of Dutch ashes and of liquid manure, which is the drainings of dunghills and the urine of cattle collected in a cistern, and allowed to become putrid.

In southern climates Flax is sown before winter, because too great heat would destroy it. It is then pulled before the heat of summer. In northern climates, the frost, and especially the alternations of frost and thaw in the early part of spring, would cause the Flax to perish; it is consequently sown as early in the spring as may be, so as to avoid the effect of hard frost. This season is late March or early April in Great Britain and Ireland, and in Holland and Flanders. The ground is prepared in Flanders beyond all other countries for the growth of Flax, and it generally forms a model for description on the subject of Flax culture. Every preceding crop has a reference to the growth of Flax. The land is deeply wrought and richly manured, in order to have a large surplus in the ground for the use of the Flax, which is generally sown after a crop of Turnips that has been well manured and cleaned. Liquid manure is poured on the land in the spring, after deep ploughing and harrowing, and the seed is sown broadcast and lightly covered at the rate of 1½ cwt. to the acre. Light lands, or very finely divided soils, are rolled, or the seed is trodden in by the feet of men. When weeds appear, they are carefully taken out by women and children, who continue the work till the Flax is too high to allow it. The seed is changed every year from Riga.

The above mode of sowing Flax is applicable to Britain, where the land must be well prepared by fallowing and manuring, and stones very carefully removed. The land is ploughed in March, and the seed sown on a finely harrowed surface, and rolled, according as the ground appears close or open. In most cases rolling is useful. The weeding of the crop must be

carefully performed. A crop of Flax should be rather thick than thin on the ground, as the latter quality induces tall thick stems, which renders coarse the textile fibres of the Flaxen reeds. If very fine Flax is desired, the crop of stems is pulled when the bottom part of the plants begins to get yellow; but then the seed will be of little or no value. It is therefore generally left growing until the capsules, which contain the seeds, are carefully grown, and the seeds formed. The pulling then begins, which must be done carefully by small handfuls at a time. These are laid upon the ground to dry, two or three obliquely across each other, and fine weather is essential to this part of the operation. Soon after the handfuls are collected into larger bundles, which are placed with the root end on the ground, the bundles being slightly tied near the seed end; the other end is spread out that the air may have access, and the rain may not damage the Flax. When sufficiently dry the bundles are tied more firmly in the middle, and built in long narrow stacks on the ground, in width as the bundles are long, and about 8 or 9 feet high. These stacks are thatched, and the perpendicular ends are supported by strong poles that are fixed in the ground. In this way the steeping is deferred till next season. The Flax is most generally carried in bundles to a shed, where the stems are pulled through an iron comb fixed in a block of wood, which takes off the capsules, and is called "rippling." The Flax is immediately steeped, or in some cases it is lodged in barns till another season, where it must be kept very dry, and if the seed is left on, which is an advantage to it, mice must be guarded against, as they are very fond of linseed, and would soon take away a good share of the profits by their depredations.

Steeping the Flax is a very important process, which requires skill and experience to do it properly. The quality and colour of the Flax depend much on the mode of steeping, and the strength of the fibre may be injured by an injudicious mode of performing that operation. The object of steeping is to separate the bark from the woody part of the stem, by dissolving a glutinous matter which causes it to adhere. A certain fermentation, or an incipient putrefaction, is excited by the steeping, which must be carefully watched, and stopped at the right time. The usual mode of steeping is to place the bundles of Flax horizontally, in shallow pools, or ditches of stagnant water, keeping them under by means of poles or boards, with stones or weights laid upon them. Water nearly putrid was supposed the most efficacious, and the mud was often laid over the Flax to hasten the decomposition—but this has been found to stain the Flax, so that it was very difficult to bleach it or the linen that was made from it. The bundles of Flax are also put into wooden frames, which rest on the bottom of the rivers, and allow the water to pass below, and the Flax is held in them by boards and weights. Longer time is required by this steeping in fresh running water, but the colour is much finer, and the mode is now generally preferred. During the steeping, the time of which depends on the cold or heat of the atmosphere, frequent examinations are made to ascertain if the fibres readily separate from the wood the whole length of the stem. As soon as this is the case, the Flax is taken out of the water—even a few hours more or less steeping than is necessary will make a difference in the value of the Flax. If it is not steeped enough, it will not be easily scutched, and the wood will adhere to it. If it has been too long in the water, its strength is diminished, and more of it breaks into tow. The bundles are now untied, and the Flax is spread evenly in rows slightly over-lapping each other, on a piece of smooth clean Grass, which has been mown or fed close. Fine weather is essential to this part of the process. It is occasionally turned over, which is done dexterously by pushing a long slender rod under the rows, and taking up the Flax near the end which overlaps the next row, and turning it quite over. Thus, when it is all turned, it overlaps as before, but in the contrary direction. It remains spread out on the Grass for a fortnight, more or less, according to the season, till the woody part becomes brittle, and some of the finest fibres separate from it of their own accord. It is then taken up, and as soon as it is quite dry, it is tied up again in bundles, and carried into the barn, to be broken and hackled at leisure during winter.

In the domestic manufactures the Flax is broken or scutched at home, when the weather prevents out-door work. The common brake consists of four wooden swords fixed in a frame, and another frame with three swords which play in the interstices of the first by means of a joint at one end. The Flax is placed between the two frames, and the upper frame is pushed down briskly upon it. It breaks the Flax in four places, and by moving the hands and rapidly repeating the strokes, the whole handful is soon broken. It is then scutched by means of a board set upright in a block of wood so as to stand steady, in which is a horizontal slit about 3 feet from the ground, the edge of which is thin. The Flax held in handfuls is inserted in this slit, and struck close to the upright board by a flat wooden sword of a peculiar shape, and moved forward as occasion requires. This operation beats off all the pieces of the wood which still adhere to the fibre, without breaking it, and after a short time the Flax is cleared of it, and fit to be heckled. But the operations of breaking and scutching are tedious and laborious when thus executed by hand. Mills are now used which revolve by horse or water power, having three fluted cylinders, one of which is made to move, and carries the other two round. The Flax plants are passed between these cylinders while thus revolving, and the stalk is by this means completely broken, without injuring the fibres. The scutching is accomplished by the same mill by means of four arms projecting from a horizontal axle, arranged so as to strike the Flax in a slanting direction until the bark and other useless parts of the plant are beaten away. In the last process by which Flax is prepared for the spinner, the "heckling," the instrument employed (called the "heckle") is a square piece of wood, studded with rows of iron teeth about 4 inches long, and disposed in a quincunx order. The Flax is drawn through between the teeth of the heckle, and repeated till every particle of extraneous matter is removed, and the whole of the filaments are arranged in distinct, even, and parallel fibres.

The preparation of land for growing Flax is much more heeded than the quality of the soil itself, provided it be at least of the middling class of fertility, and dry and loamy. Accordingly, in Flanders, where the best culture of Flax has been found, the land is rendered mellow and rich by the tillage and liquid manure; and the seed, which has been carefully selected, is covered by earth spread over it with the spade; it is afterwards rolled or trod in with the feet. The urine tank supplies an excellent stimulant in the early period of growth, especially when the blades are shooting up, after the fecula of the seed is exhausted. After that time it has been found to encourage the growth of leaves rather than of flowers and seed.

England has never produced a sufficient quantity of Flax for its own use, and the cultivation of it has decreased as agricultural improvements have advanced. It suits small farming and cottage farming, and hence the very general cultivation in Flanders and in Ireland, where the above mode of using land prevails. The preparation of the land is laborious, the treatment of the growing crop is troublesome, and the application of the produce is tedious and expensive, and any plant that needs premiums and the rewards of societies to support its use may be suspected to want the intrinsic worth, under the soil and climate, and under the circumstances of the social system, which regulate the use and fix the value of every vendible commodity. The British cultivator will grow articles which suit his market most readily, and at the least cost, of the greater return.

The average produce of dressed Flax from an acre of land may be stated at 40 stones, and the quantity of seed at 20 bushels. The ripening of the seed impairs the quality of the Flax, though some assert the contrary.

A plan is now being practised of separating the fibre and wood of the Flax plant by means of hot water applied to the stems placed upright in boxes or cisterns that are under the cover of a roof. The mode is said to have complete success. A chemical process is being tried, which easily separates the parts, and also bleaches and refines the textile fibres into an appearance of cotton, and hence called "Flax cotton." *J. D.*

## INFORMATION TOWARDS MORE ACCURATE ESTIMATES OF THE VALUE OF LIMESTONES.

Manuring, with so called artificial manures, is a fashion of such general adoption now-a-days, that he would indeed be deemed a venturesome man who should doubt the propriety of employing them extensively. In my present contribution to this journal, it is my intention to add somewhat to the history of limestones, a manure than which, it may be safely asserted, that none is so much employed, so much expected from, and so little understood. Lime, no doubt, belongs to the most useful of all artificial manures; but because its nature, varying as it does in the different counties of England, is insufficiently appreciated, none gives more frequent disappointment, or is more frequently abused. I am not going into an elaborate description of the various properties of lime. Several years ago I wrote a long article upon this subject, in this paper; and since then, the whole of the agricultural world has become indebted to Professor Johnston, for a most valuable exposition of the subject. I would simply set out with the remark, that the addition of mineral substances, such as lime, gypsum, salt, and woodash, are only so far valuable as they contribute to the soil a substance required by plants, but insufficiently contained in it. Supposing a soil to be productive of sour Grasses, it would be absurd to correct it by superphosphate of lime, salt, or gypsum. A manure should be adapted to an end; chalk would therefore be the obvious remedy for a state of soil such as I have supposed. Now, the quantity of lime required by plants is very small, and bears no relation to the quantities employed. A crop of Cabbages removes but 190 lbs. weight, and this amount is greater than in any other. Is it then to be concluded that a dressing of 3 or 4 bushels is sufficient for all the purposes lime subserves? By no means; it only proves that the lime required by plants for their nutrition is exceedingly small: for various reasons, a soil should contain about one per cent. of lime, and in applying it, greater regard should be had to the chemical properties of lime. All limes are not alike. To begin with, we have pure limes, hydraulic limes, and magnesian limes. The former can only be considered to supply lime, whilst the latter affords, at the same time, a considerable per centage of magnesia, another constituent of all seeds. To furnish one per cent. of lime to a soil six inches deep, requires eight tons of quick-lime. We may calculate upon a loss of one-third of a ton annually, by rain and by the sinking of the lime beyond the reach of the plough, and this fact will give some notion of what should be periodically restored.

Pure limestones are, however, of very rare occurrence, and their value depends much upon other constituents they convey to the soil. How much they vary with to one particular, let the following statements of limestones employed in Derbyshire, Nottinghamshire, Leicestershire, Lincolnshire, and Staffordshire, prove:—

| Carbonate of Lime. | Per cent. |
|---|---|
| Ashover | 99.89 |
| Ashover Hockley (light) | 98.85 |
| ,, ,, (medium) | 94.82 |
| ,, ,, (dark) | 96.00 |
| Barrow | 76.00 |
| Bennington | 19.00 |
| Birchwood | 98.50 |

It is evident that in many of these the quantity of magnesia is sufficiently large to be taken into consideration in endeavouring to estimate the value of a limestone for agricultural purposes. But even when we are acquainted with the proportions of magnesia, silica, oxide of iron and alumina contained in limestones, we should make a great omission were we to leave out the amount of phosphate of lime or bone-earth. I have examined upwards of 150 specimens of limestones with reference to this one particular; and, because the quantity at best is but small, I have employed ounces instead of grains in my analyses. Instead therefore of calculating the amount in 100 lbs., I shall give the quantity in a ton of limestone.

| Quantity of Phosphate of Lime in a ton | |

It must be evident, from an attentive consideration of the above facts, that the source from whence a farmer obtains his lime is a matter of much importance. Other deductions too might be made, but I forbear, fearing that this article has already occupied an inordinate length. I trust that these facts will be considered by all of sufficient importance to warrant their publication.
*Albert J. Bernays, F.C.S., Derby Chemical Laboratory, May 3.*

## Home Correspondence.

*The Beet Sugar Manufacture.*—The confidence which I am inclined to repose in your suggestions and statements has caused me to look with no little alarm on a statement in the answers to correspondents in your Paper of the 10th inst., in which, in reply to "An Irishman" you say that you do not expect the yield of sugar, in the Sugar Beet, "will be found enough to reward the cultivation and the manufacture"—alarm from my having been induced by a friend, who professes to understand the subject, to apply for some shares in the Beet Sugar Company, and also to sow several acres with Sugar Beet, to be supplied to the Company in the autumn. While disposed to rely upon your opinion, I find practical men of high character here, strongly in favour of the proposed manufacture; and you are doubtless aware that Professor Sullivan, of the Museum of Irish Industry, has published the results of several analyses which he has conducted, and which go to prove that roots grown in Ireland are richer in saccharine matter than those grown in France and Belgium, where the manufacture of indigenous sugar is extensively carried on. From some documents, official and otherwise, which a Dublin merchant obtained from France, and which I had an opportunity of inspecting, I find that 15 tons of roots are sufficient to make 1 ton of sugar; and according to Professor Sullivan a smaller quantity of roots will be sufficient here, on account of the comparatively larger quantity of sugar contained in Irish roots. From the same documents, as well as from those published by the Beet Sugar Company, I find that the actual cost of manufacture per ton of sugar, amounts to from 7*l.* to 8*l.* The question as regards the manufacturer will therefore stand thus, assuming the price to be paid for the roots to be 15*s.* per ton.

| | | | |
|---|---|---|---|
| 15 tons of roots at 15*s.* | ... | 11 | 5 0 |
| Cost of manufacture, say | ... | 7 | 10 0 |
| Cost of producing 1 ton of sugar | ... | £18 | 15 0 |

It therefore appears that Beet-root sugar could be produced at 18*l.* 15*s.* per ton, and this is without taking into account the molasses, or the refuse of the manufacture. When the duty is added to this there still remains a handsome margin for profit to the manufacturer. The manufacture of sugar from Beet-root having attracted considerable attention in Ireland during the past two years, the growth of the Sugar Beet has been tried on a small scale by many persons, under a great variety of circumstances, and the result has been generally favourable. With good management, therefore, we calculate on 25 tons to the statute acre, a return which good tillage will far exceed; but even at 25 tons the return from an acre of Sugar Beet would, at 15*s* per ton, amount to 18*l.* 5*s.*, exclusive of the leaves, which are of great value. To both farmer and manufacturer, therefore, the speculation appears to be a good one, unless some mistake is committed which I cannot see; but I place these figures before you in the hope that you may examine the question, and apprize your readers, myself among the number, whether the movement which is exciting so much attention in Ireland is likely to end in disappointment. I confess I am one of the parties who think well of it, and therefore it is that I am anxious to place before you the data on which the calculations are founded, so that if unsound, the error may be pointed out. The very great importance of the subject on which I write will, I trust, be a sufficient apology for the liberty taken in addressing you by *Another Irishman.*

*Fertility from Draining.*—In these times, when the means to continue the profitable cultivation of our land are only to be sought for in increasing its returns, I believe no information is more deserving the attention of landowners and farmers than that which will be afforded in considering some of the beneficial consequences from thorough draining of wet land. Farmers have always seen the immediate mischief to vegetation which is the consequence of water resting on their land, and from the earliest times have paid attention to keeping the surface of their cultivated land dry; but in all they have been doing, their views have been limited to preserving their crops uninjured from excessive wet, and thus have sought no other effect in their draining than the prevention of harm. The fertilising action of rain in its passage through the soil, in decomposing both organic and inorganic matter, and in carrying of warmth and nutriment to the roots of plants, has been unthought of; they have been seeking the discharge of rain from the surface of the ground by means of open furrows and shallow drains, as if each winter brought too much, and it were poison to their crops, and as though the elements of fertility which this surface running off the water robs the land were worthy of no consideration. But rain is sent at all seasons for important purposes, and none should be allowed to pass away until it has effected the ends for which it is sent. When land becomes saturated with water (and all land which does not naturally rest on a porous strata, or has not been thoroughly drained, is in this state for some months in every year), it ceases to admit of the descent of rain; and all that falls upon it, supposing the ground to have been landed up and intersected with furrows in the usual way, runs over into the furrows, and thence to the ditches, and away. The effect of rain falling on ground whilst in this condition will be readiest explained by bringing to consideration two long jars—one with, and the other without a vent at bottom. If these jars are filled with earth, and water be poured on them, the water poured on to the one without a vent, after a time—that is, after the earth has become saturated—will run over the top and down the sides; whilst the water poured on to the other, will be seen to sink down and pass out through the vent. These two vessels represent land in the two conditions—"of undrained and drained;" and to show what must be the different action of rain on land in these two conditions, we must suppose some of the matter on the two surfaces to be soluble and exposed, to water poured from a height, in imitation of the descent of rain. In one instance the dissolved matter will pass away with the water over the sides of the jar and be lost; but in the other, it will be carried into the interior, and, by the filtration of the water, be taken and retained by the soil; and this is precisely what is taking place for some months in the year, with respect to manure, and the finer particles of soil on the surface of land. The landed up ground, in casting off the rain casts with it the manure and mineral matter dissolved or taken up by the rain; and as the difference of colour of the two waters from the jars betray the presence and absence of the dissolved matter in the water, so will the muddy stream in the ditches, in contrast with the clear spring-like water from deep drains, betray the loss that undrained land sustains by the pains the farmer usually takes to preserve his crops from the injury from standing water. The use of rain on drained land, in the winter season, in annually dissolving and carrying down of matter and placing in store within reach of the roots food for the summer support of vegetation, appears to me one of the most beautiful processes in nature, to support a continuous vegetation. In this way I see the yearly provision of the tree brought to its roots, and its annual growth provided for. I can now understand the annual springing up of our pastures, and the luxuriant spring vegetation, with no other assistance than the food provided by the winter rains. *Hewitt Davis, 3, Frederick's-place, Old Jewry, London, May 14.*

*Agricultural Education.*—I am sure all lovers of their country are indebted to you, for the able manner in which you have again revived the subject of agricultural education, in the last three numbers of your valuable *Gazette.* You have clearly proved (what no considerate man ever doubted) that practice and science are not antagonists, but necessary friends to one another. I cannot understand the cause of the light estimate in which the latter is held by many excellent practical farmers, unless it be the common difficulty of appreciating what is not understood. We are most of us more or less guilty in this respect. I have known many who recognise the value of a knowledge of the dead languages, and yet refuse the same to that of the natural sciences; yet the former is merely a knowledge of words, the latter of things. How can any one be a worse farmer, steward, or labourer from knowing the qualities of the things within his reach—that surround him on all sides, and are the very subjects with which he has to operate in the application of capital and industry to a successful issue? And this is simply what these sciences teach. However, thanks to advocates like yourself, the spread of scientific knowledge is rapidly going on, and descending in so complete a form, even to the labourer, through the means of highly qualified masters from the training schools, that our friends must look about them, or they will have men at their ploughs better instructed than their sons. I lament with you that the list of institutions adapted for their use is so short, but as the importance of education is more appreciated, the demand will create a supply. I feel indebted for your consistent advocacy of the one that I have been most connected with; I have great confidence that if the system now at work, both in the schools of science, and on the farm, be steadily adhered to, the Royal Agricultural College will soon be an institution her friends may be proud of; and what is far better, one that will spread a sound and comprehensive scientific and practical education, which will raise the agricultural class to a position in the country far above that they have hitherto held. *R. J. Brown, Cirencester.*

*Draining Act.*—I beg to call your especial attention to a bill now before Parliament, entitled, "A Bill to extend the provisions of the Drainage of Lands Act, 1849, to the advance of Private Money for the Erection and Repair of Farm Buildings, &c." By the 2d clause it is provided, "That the money to be borrowed or advanced under this Act shall not in any case exceed in amount 18 months' value of land, in respect of which money shall be sought to be borrowed, &c." Now it appears to me that this restriction as to value will nearly render the Act worthless. I do not see why any rule should be laid down defining the amount to be advanced, because an inspection by a competent commissioner would have to be made of the farm and premises before any money could be obtained under the Act, and the security afforded by such inspection, coupled with the obligation on the owner to see the annual instalment of principal and interest repaid, would be sufficient protection against over building. But should it be thought necessary to interpose a limit to the amount to be borrowed, it certainly should not be less than four or five times the value of the land it was intended to benefit. I have at this moment several estates under my consideration to which an Act, allowing only 18 months' value of the land to be borrowed, would be of very little service. I will mention one instance: a large estate was left by its last proprietor with scarcely a farm house or farm offices of any kind upon it. On its coming to its present owner he began at once to erect the necessary offices for the respective farms. The farms do not average 400*l.* a year, and the house and offices erected upon each have averaged 2200*l.* Now in this case only 600*l.* could have been obtained under the Act; and had the estate descended to a gentleman with only a life interest in it, and having a numerous family, the farms must have gone without those buildings which an improved course of husbandry and difficult times render necessary. I trust to your influence and the influence of your numerous readers being given to obtain the removal or extension of this limit of value. *Roaldus.*

*Skylark, case of the; final hearing, and application for his discharge.*—I have waited one week, two weeks, and now nearly three weeks, most patiently, to see how many more witnesses would come forward against my hapless friend, the lark. To show the all-but universal reluctance entertained to prosecute this matter any further, one, only one English farmer (Mr. Hurt, of Etwall) has entered the witness-box against the defendant during all the period of discussion! The evidence of this gentleman, too, is rather general than particular; for it speaks only of larks having been seen to bite off the tender blades of young growing corn. I believe firmly they do, occasionally, so offend; and I can readily imagine that this vegetable diet amalgamates well with their animal food. Who would grudge it them? Mr. Hurt, however, shows no bitterness of spirit, and I thank him for giving his evidence so fairly. He proves neither too little nor too much. The second witness, Mr. Graham, of Cranford, enters the lists on my side. His arguments are good; he says, if the *larks* are to be killed, destroy also, for similar reasons, the mighty armies of sparrows, tits, rooks, chaffinches, &c., which devastate the land. He is right. If the principle is to be preserved intact, there must be "war to the knife" with the whole feathered tribe *feræ naturæ;* and even then, as Mr. G. naively remarks, future crops will be equally scanty and "gappy," and the whole blame cast upon the "grubs!" It is "plain to the meanest capacity," that if these birds were all killed, the GRUBS *would be* the destroyers of the corn. But thus it ever was, and thus it ever will be. We are a grumbling people; never satisfied. If Providence sends us cold, rainy weather, and it lasts, as we think, too long, we are in a rage immediately; we lament, in piteous tones, that the harvest must be a failure; that the price of bread will be raised, the poor oppressed, and the farmer ruined: and yet, after all, we find the harvest most abundant; bread cheap as ever, the poor constantly employed, and the farmer grumbling at the small value of his corn. Well is it for us that an all-wise Director sits at the helm of affairs! If the reins of power were in our hands, we should, Phaeton like, make a sad mess of it indeed! Let me volunteer now, on the part of my *protegé*, to withdraw the record, and enter a new plea of "guilty." The trembling defendant can then be brought up at once for judgment; and after being reprimanded, I urge his immediate discharge. We shall all of us hear his lovely voice somewhere this summer, as we journey about in the neighbourhood of corn-fields; and never shall any of us repent having let the "divine attribute of mercy" interfere on his behalf. "Use every man according to his deserts, and who would escape whipping?"—not *William Kidd, New Road, Hammersmith.*

## Societies.

### ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

THE MAY GENERAL MEETING was held at the Society's House, in Hanover-square, on Thursday last, the 22nd inst., his Grace the Duke of RICHMOND, K.G., President, in the Chair.

On the motion of Mr. RAYMOND BARKER, seconded by Mr. Brandreth, of Houghton-house, in Bedfordshire, and Mr. Hudson, of Castleacre Lodge, Norfolk, the Earl of Ducie was unanimously elected President of the Society, for the year ensuing the Windsor Meeting in July next.

On the motion of Mr. OVERMAN, of Norfolk, seconded by Mr. Knight, of Edmonton, the Trustees of the Society were re-elected.

On the motion of Mr. SILLIFANT, of Coombe, Devonshire, seconded by Mr. Cosens, of Langdon, in the same county, the Vice-Presidents of the Society were re-elected.

Mr. Fisher Hobbs, Mr. Jonas, and Mr. Robert Smith, having been appointed by the President as the Scrutineers of the Balloting Lists, they reported, that the election of 25 General Members of Council had been adopted by the Meeting, agreeably with the house-list of the Council.

The Secretary, by direction of the President, then read the following Report from the Council:—

REPORT.

The Council have to report that since their last General Meeting in December, the Society has been deprived by death of 65 of its members, including Sir Francis Lawley, Bart., one of the founders and trustees of the Society, and the Hon. Captain Pelham, a member of the Council and one of the Stewards of Implements at the Country Meetings of the Society; 216 names have also been removed from the list, while 163 new members have been elected during the half-year. The Society accordingly now consists of—91 life governors,

162 annual governors, 674 life members, 4175 annual members, and 19 honorary members; making a total of 5121 general members on the list of the Society.

The Council have transferred the name of Colonel Challoner from the general members of Council to the class of trustees of the Society, to fill the vacancy in that list occasioned by the decease of Sir Francis Lawley; and they have elected Mr. Pendarves, M.P., into the Council, to complete the number of their members.

The chemical investigations are proceeding in a satisfactory manner, and the subject of the absorptive properties of clay soils in reference to manuring matter continues to receive from Professor Way the attention which its importance demands. The torrefaction of soils, or burning of clays, for the purpose of effecting a beneficial change in their mechanical condition and physical properties, has been selected by the Chemical Committee as the new subject for investigation on the completion of the analysis of marls; and the Council hope that members residing in districts where such process is adopted with success, will take an early opportunity of sending to the Secretary specimens of such fertilising clays, in their natural as well as in their burnt state, along with a statement of any facts within their knowledge connected therewith. As Consulting-Chemist of the Society, Professor Way has spontaneously offered to reduce his charges to the lowest possible scale for making analyses of guano for the members; and as the Council consider a special analysis of that manure to be the only safeguard against the attempts at fraud so extensively practised by unprincipled dealers, they trust that the members of the Society will avail themselves of so cheap, simple, and effective a means of security.

The Council have decided to renew the grant of 200*l.* to the Royal Veterinary College, for the year, for the purpose of aiding that institution in carrying out one of the original objects of the Society, namely, "The improvement of the veterinary art, as applied to cattle, sheep, and pigs;" such renewal being made under the following conditions:—1. That all members of the Royal Agricultural Society of England shall have the privilege of sending cattle, sheep, and pigs to the Royal Veterinary College, on the same terms as if they were subscribers to it; and 2. That the Royal Veterinary College make a report at the end of the year of their proceedings in connection with this grant.

During the past half-year the Council have made such alterations in their bye-laws as will restrict the official business more completely to the Monthly Meetings, in order that the Weekly Meetings may be given up entirely to short introductory lectures, leading to subsequent discussion, and the communication of personal experience among the members, on topics connected with practical farming. Professor Way and Professor Simonds have each expressed their willingness to take such part in these proceedings as the Council may from time to time think desirable, and will make arrangements accordingly.

On a former occasion the Council reported to the members the offer of a site in Hyde Park for the Society's Agricultural Show of Breeding Stock: the conditions for the occupation of that site, however, which were subsequently submitted to the Council by the Commissioners of Woods and Forests, were such as the Council, acting on the part of the Society, could not accept. The First Minister of the Crown then expressed his desire to promote the objects of the Society by the offer of a site to which, from its locality, no such conditions as those necessarily required in the case of Hyde-park would apply. Accordingly, Her Majesty's consent, on his lordship's representation, was at once given for the Society to select a site in such one of the Royal Parks of Hampton-court, Bushy, or Kew, as might be found on inspection most suitable for the purposes of the Society. The Council, in pursuance of this offer, decided to select a site in Bushy Park, and were placed by the Government in communication with the Commissioners of Woods and Forests and the Master of the Horse, when the authorities of Windsor informed the Council of the gracious permission of Her Majesty, and that of His Royal Highness Prince Albert, to place the Home Park of that Royal demesne at the disposal of the Society, as a site for the purposes of that Country Meeting, should the Council consider it preferable to the one already selected in Bushy Park. The Council, on the report of the same Committee of Inspection that visited Bushy Park, decided that the Country Meeting of the present year should be held in the Home Park at Windsor, agreeably with the permission thus so graciously conceded to the Society: a permission which the members of the Society will not fail to regard as not only gratifying in itself, but as enhanced in its value by the condescending manner in which it has been communicated.

The attractiveness of the Home Park as a site for the meeting, and its immediate contiguity to the Great Western and South Western Railways, will no doubt tend to the access and accommodation of a larger number of visitors than have attended on any former occasion. Notwithstanding the short period during which the Mayor and Corporation of Windsor had on this occasion an opportunity of making arrangements for the Society's reception at a place of meeting to which they had invited its Members, the Council have the satisfaction of stating that those arrangements have been completed most satisfactorily, as in the case of other places where the Country Meetings of the Society have been held, the Mayor of Windsor, in the name and on behalf of himself and the Corporation, having entered into guarantees with the Commissioners of Woods and Forests, by which the Society will, agreeably with the Royal Permission, be granted the full and free occupation of the sites selected in the Home Park for the purposes of the Meeting, and be held harmless from all liability of damage and from all charges of occupation. The Mayor and Corporation have also placed the sum of 600*l.* to the credit of the Society's account with Messrs. Drummond, as a subscription from the town and neighbourhood of Windsor, intended to meet to that extent the heavy expenses which the Society always incurs in the preparations for its Country Meeting. The week of the Society's Country Meeting at Windsor will commence on Monday, the 14th of July next. The Show, as ascertained from the entries made, will consist of upwards of 1200 head of breeding stock, and will be opened to the public on the Tuesday, Wednesday, and Thursday; and the dinner of the Society will take place in the Home Park, on the Wednesday of the same week, in a pavilion constructed to contain 2000 guests. Members of the Society who apply to the Secretary for their Pavilion Dinner Tickets between the 20th June and the 5th July, will receive them on the usual conditions. The Council have nearly completed with the principal railways throughout the kingdom the arrangements for the conveyance of the stock to and from the Show; and in every case where they have at present received a decision, a free transit has been granted to the stock entered for the Windsor Meeting, both to and from the Show; and they have every reason to believe that the same liberal concessions in favour of the Society's Exhibitors, for the purpose of promoting the objects of the Society, will, as in former years, be conceded by the other railway companies, to whom they have also applied. The Council have taken measures for obtaining a greater number of nominations from which to select the Judges for the Country Meetings; but they still feel the imperfection of all plans hitherto adopted for their appointment. The Council duly appreciate the great importance of a strict and impartial adjudication of the Society's prizes, by men not only disinterested in themselves, but fully qualified by their abilities and experience for the arduous task confided to them; and the Council will esteem it a favour if the Members of the Society at large, will, from time to time, transmit to them any suggestions that may tend to promote this desirable object, and essentially to give effect to that competition for excellence which the Society, by its premiums, evinces so great a wish to excite. They have already referred it to the Judges, as part of their duty, to ascertain and report to the Council any failure in the due shearing of the sheep, or any excess in the market condition of the animals inconsistent with their character as breeding stock. They consider that the higher the character of their judges becomes, the more powerfully will they be able to aid the Council in repressing many of the abuses alleged to take place in the competition for prizes. They also hope that the time is not far distant when the judgments given in the Show-yard, in the case of Live Stock, will be founded on well defined-and acknowledged principles, having reference in each class to some assigned standard of excellence; and that these judgments although formed on less distinct and constant data than in the case of implements, may gradually approximate in some degree to uniform and consistent results, that may prove, like those in the implement yard, satisfactory, at the same time, both to the Judges, and the competing exhibitors; and thus tend to establish those points of form, development, and quality which constitute perfection of breed in the different classes of animals adapted for agricultural purposes.

The Council have selected Lewes as the place of the Country Meeting of the Society for the year 1852; and they have at the same time constituted a new district for the Country Meeting four years in advance from the present time, agreeably with their usual practice. The rotation of districts, therefore, now stands as follows:—

1852—South-Eastern, District comprising the counties of Kent, Surrey, and Sussex.

1853—South-Wales District, comprising the whole of South Wales, with the addition of the counties of Gloucester, Hereford, Monmouth, and Worcester.

1854—East-Midland District, comprising the counties of Leicester, Lincoln, Nottingham, and Rutland.

1855—North-Western District, comprising the counties of Lancaster, Westmoreland, and Cumberland, and the Isle of Man.

The Council, in conclusion, have every reason to congratulate the members on the continued prosperity of the Society, and on the undeviating manner in which it steadily pursues those practical objects connected with the improvement of land, the management of crops, and the general advancement of good husbandry, in which all its members are more or less deeply interested.

By order of the Council, James Hudson, Secretary.

On the motion of Sir R. P. Jodrell, Bart., seconded by Mr. Windgate, of Hareby House, Lincolnshire, this report was received and adopted by the meeting.

Mr. Raymond Barker, Chairman of the Finance Committee, read the following balance-sheet from the Auditors, on the part of the Society.

Half-yearly Account, ending the 31st December, 1850.

Receipts.

| | | | |
|---|---|---|---|
| Balance in the hands of the Bankers, 1st July, 1850 | £2435 | 3 | 8 |
| Balance in the hands of the Secretary, 1st July, 1850 | 19 | 17 | 3 |
| Dividends on Stock | 160 | 6 | 1 |
| Life-Composition of Governor | 50 | 0 | 0 |
| Life-Compositions of Members | 239 | 0 | 0 |
| Annual Subscriptions of Governors | 85 | 0 | 0 |
| Annual Subscriptions of Members | 1508 | 17 | 0 |
| Receipts on account of Journal | 234 | 13 | 6 |
| South Devon Prizes | 50 | 0 | 0 |
| Receipts on account of Country Meetings | 1143 | 2 | 11 |
| | £5925 | 19 | 11 |

(Signed) Thomas Raymond Barker, Chairman, C. B. Challoner, Thomas Austen, } Finance Committee.

Payments.

| | | | |
|---|---|---|---|
| Permanent Charges | £178 | 12 | 6 |
| Taxes and Rates | 13 | 15 | 2 |
| Establishment | 422 | 13 | 0 |

| | £5925 | 19 | 11 |

Examined, audited, and found correct, this 16th day of May, 1850.

(Signed) Thomas Knight, Robert Beman, Geo. I. Raymond Barker, } Auditors on the part of the Society.

On the motion of Mr. Batten, of Somersetshire, seconded by Mr. Dyer, of Hampshire, the best thanks of the Society were voted to Mr. Knight, Mr. Beman, and Mr. George I. R. Barker, for their care and kind trouble in auditing the accounts.

On the motion of Mr. Shaw, of London, seconded by Mr. Smith, of Exmoor, the best thanks of the Society were voted to Professors Way and Simmonds for the lectures they had kindly delivered before the members of the Society.

On the motion of Colonel Challoner, seconded by Lord Camoys, the best thanks of the meeting were carried by acclamation to his Grace the Duke of Richmond, the President of the Society.

The votes of thanks were respectively acknowleged by the parties present, to whom they had especial reference.

Lecture.—Professor Way will deliver a statement before the members in the council-room, on Wednesday next, at 12 o'clock, on the preparation, composition, and agricultural use of superphosphate of lime.

## METEOROLOGICAL REPORT.—May.

(*Continued from page 317.*)

| Date. | Time. | Max. | Min. | Wind.—Weather. |
|---|---|---|---|---|
| May 14 | 11 a.m. | 30.21 | ... | NE. Gentle breeze, and fine day. |
| | 10.50 p.m. | ... | 30.17 | |
| 15 | 7.20 a.m. | 30.16 | ... | a.m. Bright sunny cloudless morning, gentle NE. breeze. |
| | | | | 2 p.m. Wind shifted, and upper scud began to fly from SW., lower as before from NE. |
| ° | 5.55 p.m. | ... | 30.05 | Sunset. Very threatening appearance to W. |
| 16 | 7.50 a.m. | ... | 30.00 | NW. Gentle, fine, sunny morning. |
| | 12.40 p.m. | 29.97 | ... | SW. Wind shifted, and sky overcast; about 7 p.m. a slight shower of rain; wind S. |
| | 7 p.m | ... | 29.90 | |
| 17 | 7.30 a.m. | 29.84 | ... | SSW. Gentle, cloudy, pleasant day. |
| | 9.15 p.m. | ... | 29.83 | |
| Sun. 18 | 7.50 a.m. | 29.83 | ... | WSW. Brisk breeze; overcast, with very rainy appearance, but none fell. |
| † | 4.40 p.m. | ... | 29.78 | Thin, misty, overcast, passing swiftly from SW. |
| | 6.30 p.m. | ... | 29.79 | NW., and more moderate. |
| | 10.20 p.m. | 29.85 | ... | Fine evening and night. |
| ‡ 19 | 7 a.m. | ... | 29.84 | a.m. WNW. Stiff breeze; heavy clouds. |
| | 10.50 p.m. | 29.99 | ... | p.m. NW. Stiff breeze; fine day. |
| 20 | 7.35 a.m. | ... | 30.10 | Stiff NNW. breeze, and fine. |
| | 10.55 p.m | 30.20 | ... | |

* This storm must have been at some distance; it probably came from the Bermudas, and turned off to northward.

† This storm came from westward, and passed over England to the eastward.

‡ This was certainly a different current from the last one; it must have lain a long way to the westward, and probably on the 17th produced a heavy gale off Newfoundland.

Dorchester, May 22d. *F. P. B. M.*

(*To be continued.*)

## Notices to Correspondents.

Bricks: *W B H* says, "My object being the improvement of agricultural buildings, I take the liberty of asking your more experienced correspondents what is the best size and form to make brick for building farm premises, and whether or not it is advantageous to have them made hollow, and what is the best shaped mould for such a purpose? A brick-maker near me proposes a brick 18 inches by 9, made hollow by a machine."

Ducks: *Lover of Poultry.* Grains are hardly nutritive enough for growing ducks of seven weeks old, unless mixed with the finest pollard and a sprinkling of Barley-meal; Barley-meal with pollard and milk, not too stiff, is an excellent diet for fatting ducks. They will get on faster shut up in an old stable than when having the run of your rather large garden and pond. For further information buy a Poultry-book or two.

Escape of Milk: *W W.* When the cow becomes dry, the fistula in the teat may be cured by an operation, but not while milking continues. *W. C. S.*

Gorse: *Inquirer.* If for use as fodder, to cut it every other year will involve as little waste as possible.

Kilns: *G Forrester.* Your letter will be answered by a competent authority in a short time.

Management of Poor Land: *A Speculator* will find that all crops require manure. If your land is infertile, owing to poverty, lime will only add to the mischief. Plough it and re-plough it this summer, and force next year a crop of Turnip or Mangold Wurzel by means of guano and superphosphate, as you have no farm-yard dung at command; consume them on the land, and then grow Barley and seeds, and let the land lie down for a year or two.

Mangold Wurzel: *A B* says, "There is a paper, in the *Agricultural Gazette* of the 17th inst., signed 'H. E.,' in which he gives us an account of root crop culture. Will he be so kind as to explain whether Mr. Huxtable applies a pint of phosphate to each Turnip or Mangold Wurzel root? and if it be placed above the seed when it is dibbled?"

NAMES OF PLANTS: *Barley.* Common Burnet, or Poterium sanguisorba, and (?) Avena pubescens.

NIGHT SOIL: *J Macaulay.* Coal ash will not do so well as dry peat or peat charcoal. Add about two of the ash to one of night-soil; and six or eight tons of the mixture per acre, drilled in, will be a good dressing.

POTATOES: *Northwood.* It is too late to plant Potatoes. Turnips are now your best crop.

POULTRY: *Hertfordshire Lady.* The disease described is unfortunately not peculiar to your locality, nor uncommon amongst poultry, to which, as well as to pheasants, it is terribly fatal. Nor are Dorking fowls especially liable to it. Your cold Hertfordshire land may perhaps have a tendency to the endemical prevalence of the worm which accompanies the disease of the trachea, commonly called *the gapes*, but to say how it comes there, would be to open the whole difficult question of the *entozoa*. Although the malady may not be mentioned in "Farming for Ladies," you will find something about it at p. 257—81 of the 2d edition of Dixon's "Ornamental Poultry," and at p. 150 of the new edition of Richardson's "Domestic Fowl." Prevention of the disease is far better than cure. The best advice we can give you is entirely to change the spot where your poultry are reared, after having had the place inspected by some one competent to give an opinion. Perhaps game fowls may thrive better than Dorkings in your peculiar position.—*Constant Reader* should buy a poultry book. Having little more information than that the young pea white ducks *do* die, it is not easy for us to say *why* they die.

THE DROP AFTER CALVING: This very fatal disease prevails much more in some years than in others; occurs usually in the spring, and attacks more particularly those cows in which the lactiferous system is particularly developed. Thus Guernsey and Jersey cows are particularly liable to this disease, and the better they are kept, and the less exercise they take—in fact, the kinder they are used, the greater is the liability. It usually appears several days after calving, and with the third or fourth calf, and is ushered in by no premonitory symptoms. The animal is down and cannot rise; the head is turned back to the side, rumination ceases, the appetite is gone, the pulse is increased, and though the cow will moan heavily, she otherwise appears in a state of unconsciousness. Though inflammation of the womb is often present, it is not invariably so, and indeed does not constitute the disease, which is rather a paralysis of that part of the nervous system which supplies the hind extremities, the organs of the pelvis, and the mammæ with nervous energy, and it may be ascribed to the great and sudden demand made on this part of the system by the act of calving, and the development of the udder in the secretion of milk. There are two varieties of the disease, which may be distinguished as the *acute* and the *subacute*, the former usually fatal, the latter often curable. To prevent the occurrence of this disease in subjects predisposed to it, the cow for some little time previous to calving should be encouraged to take exercise, and should not be very highly fed; sort food may be given, and a dose of salts some days previous to calving. With regard to the cure, a powerful dose of physic should be given, such as a pound of sulphate of magnesia, with vegetable tonics, and followed by a pound of Linseed oil and 20 drops of croton oil. It is astonishing what immense doses of cathartic medicine may be given in this disease. An active blister should be applied to the spine, and the bladder relieved by means of a catheter. By following out the mode of treatment a cure may often be effected, unless the animal is in such a state of unconsciousness that fluids may be poured down the gullet without any effort being made either to swallow or resist them. These extreme cases are, we fear, "past all surgery." *W. C. S.*

TURNIPS: *W.* On the flat 24 inches is not too wide, if your land will grow a crop. Kohl Rabi should be sown in seed beds a month before his. and transplanted.

TURNIP SEED: *C A, Tottenham.* It must not be mixed with guano. Unfortunately your letter w s mislaid.

# Markets.

## COVENT GARDEN, May 24.

Hothouse Grapes are plentiful and cheap. Pine-apples are more abundant. The same remark applies to Strawberries. Dessert Apples chiefly consist of American Newtown Pippins. Oranges and Lemons are plentiful. Nuts remain nearly the same as last week. Vegetables of all kinds are abundant. Asparagus, young Carrots, French Beans, and Green Peas are still received from France, Cucumbers from Holland, and considerable quantities of Potatoes and Asparagus from Cornwall, as well as green Gooseberries. New Potatoes may be obtained at from 2d. to 6d. per pound; old kinds realise better prices. Lettuces and other salading are sufficient for the demand. The best Mushrooms fetch 1s. 3d. per pottle. Cut flowers consist of Heaths, Pelargoniums, Camellias, Mignonette, Double Primroses, Stephanotis floribunda, Cinerarias, Moss and Provins Roses.

### FRUIT.
